contained a fully MIRVed warhead along with an increased range and better operational capabilities, became operational in 1971. The final development was the Trident I C-4 and the Trident II D-5. The Trident missile provided greater accuracy and a more powerful warhead, giving it the ability to penetrate strategically hardened targets. The Trident II D-5 remains the only active SLBM in service today.

Soviet Nuclear Missiles

Owing to competition with the United States and internal political struggles, the Soviet Union pursued a multifaceted approach to its nuclear missile development. Given the local threat from continental Europe, as well as the more distant United States, the Soviets developed a variety of both short- and long-range ballistic missiles. Soviet missile designer Sergei Korolyov is credited with developing the R-7, which can be considered the first operational ICBM with its first successful launch in 1957. The R-7

was not without its flaws as it was expensive and used a combination of kerosene and liquid oxygen that required 24 hours to fuel, thus making its use in a nuclear exchange somewhat impractical. The second generation of Soviet ICBMs included the R-9 and the R-16 ICBMs and the R-5M, the R-12 (featured during the Cuban Missile Crisis), and the R-14 IRBMs. These missiles used more stable fuel combinations and contained warheads of between 1 and 5 megatons. The next generation of Soviet missiles, the R-36 and the UR-100, sought to emulate the capabilities of the American Titan II and Minuteman missiles. These were liquid fueled and contained single warheads from 18 to 25 megatons. The fourth generation of Soviet missiles included the MR-UR-100, the R-36M, the UR-100N, the RT-23, the Topol, and the Topol-M. These missiles brought advances in both performance and accuracy with the ability to deliver between six and ten 550 kiloton warheads to just about any location. The current Russian land-based missile inventory includes 176 Topol, 15 RS-12M mobile launcher, 50 RS-12M silo launcher, 120 RS-18, and 104 R-36M missiles.

Soviet SLBMs went through several iterations of development and, unlike the American SLBMs, most were liquid fueled. The first SLBM (the R-11FM) debuted in 1959 with single warhead capability of up to 0.5 megaton. Subsequent SLBM development of the R-13, the R-21, the R-27, the R-29, and the R-31 versions brought greater distance, going from 150 to 9,100 miles, and warheads capable of up to 1.5 megatons. The R-29R, the R-29, and the R-39RM introduced MIRVed capability containing between 3 and 10 warheads per missile. The most modern Russian SLBM is the RSM-56, a solid fuel-based missile containing anywhere from 6 to 10 warheads. The current Soviet fleet of SLBMs consists of 96 R-29R, 40 R-29, 96 R29-RM, and 36 RSM-56 missiles.

The Current Outlook

Although the United States and the Soviet Union were the pioneers in nuclear missile development, they are not the only owners of this technology. Other countries have devoted considerable resources and incurred great risk developing these capabilities. The current list of countries that possess nuclear missiles includes the United States, the Russian Federation, the United Kingdom, France, China,

Israel, India, and Pakistan. However, since the turn of the century, the United Kingdom and France have scaled back their nuclear programs to SLBMs and air-to-ground missiles (France only). Meanwhile, the United States and the Russian Federation have been working to reduce their arsenals, culminating with the signing of the 2010 Nuclear Disarmament Treaty. A key provision of this treaty involved reductions in nuclear missiles. In stark contrast, India, Pakistan, and North Korea have made significant investments in their nuclear missile programs. India and Pakistan possess both IRBM and SLBM capability. North Korea is suspected to have IRBM capabilities, though confirmation remains difficult. They have, however, conducted several high-profile, yet

unsuccessful, ICBM tests. China and Israel, both possessing nuclear triads, continue to invest heavily in their respective arsenals. Iran is the most high-profile country to be actively seeking, if not actually developing, nuclear missile capability.

The detonation of a dirty bomb or suitcase-sized nuclear bomb remains the most likely method of nuclear attack these days. However, nuclear missile security presents an altogether different and perhaps greater risk. The biggest challenge is political stability. When a nuclear capable country's political and military control is unclear or deteriorating, it makes securing nuclear weapons difficult. An unclear leadership structure creates inadequate command and control directives, leaving questions as to who can

A North Korean soldier stands guard in front of a military vehicle carrying what is believed to be a Taepodong-class missile, an intermediate-range ballistic missile (IRBM), about 20 meters long, during a military parade to mark the 100th anniversary of the birth of the country's founder Kim Il Sung in Pyongyang on April 15, 2012. The commemorations came just 2 days after a satellite launch timed to mark the centenary fizzled out embarrassingly when the rocket apparently exploded within minutes of blastoff and plunged into the sea.

authorize nuclear weapons attacks and under what conditions. This breakdown has serious implications for mobile and dispersed nuclear forces, such as SLBMs and IRBMs, where local commanders may not adhere to the commands of a central government. Similarly, if a government suddenly ceases to operate, as happened with the dissolution of the Soviet Union, the physical security of nuclear weapons becomes an issue. Again, mobile-based nuclear missiles are particularly vulnerable to theft or illegal sale.

Another growing concern with nuclear missiles is digital security. Most of these systems were built prior to the public Internet and when computing technology was rudimentary. Consequently, there is some question as to what digital vulnerabilities may exist in the underlying computing systems. It is conceivable that a foreign hacker could gain unauthorized network access to the launch control facilities or broader communication network. There is some question if digital security systems could hold up to brute force attacks, similar to the ones that cripple public websites. An attack like this, at minimum, could limit or disable nuclear readiness and at worst trigger an unauthorized launch. Finally, perhaps the greatest threat to security remains accidental launch. Without the proper safeguards in place, confusion, malfunction, or misinformation can lead to unintended weapon launches. More than once during the Cold War, global nuclear catastrophe due to equipment malfunction or communication problems was narrowly averted. With more systems and less governance, the potential for accidental disaster is on the rise. While treaty reductions in the number of weapons are desirable, greater security and oversight on the weapons themselves will be a challenge in the years to come.

Of all the countries that have developed and deployed nuclear weapons, there is one thread of commonality. Due to the advantages of cost, speed, and security, nuclear missiles are the preferred method for delivering nuclear warheads.

MOBILIZATION

Mobilization is the organization, preparation, and deployment of a nation's manpower and materiel for war or national emergencies. Mobilization encompasses myriad organizations, including all active branches of the armed forces, the reserves, and other federal agencies involved in disaster relief or "whole-of-government" operations in overseas stability missions. Manpower considerations also include training new personnel and maintaining individual and unit combat effectiveness. Material preparation includes all aspects of logistical support to the armed forces, including industrial production. Mobilization efforts have increasingly included private contractors for logistical support both in the United States and overseas. One of the main uses of contractors in mobilization is to provide training on and maintenance of newly fielded equipment. The United States maintains a high level of readiness for contingency operations around the world across a wide spectrum of conflict. The government is also working to improve cooperation between the Departments of Defense and Homeland Security to improve responses to natural and human-made disasters.

U.S. Mobilization, 1776–1898

Until World War I, the U.S. Army maintained a small force of regulars, and in wartime, it relied on U.S. volunteer regiments to provide the soldiers necessary support to wage a major war. This process entailed the president, as commander in chief, to issue a proclamation calling for volunteers followed by the secretary of war providing quotas to state governors who in turn mobilized volunteers

for federal service. In contrast, continental European nations maintained large standing armies filled with conscripts and supplemented by reservists who could be called into service in times of crisis. The term *mobilization* was first used in public discourse in the 1850s to describe the planning processes of the Prussian General Staff. By the late 19th century, elaborate plans allowed major European powers to mobilize quickly and send vast armies to their borders within a matter of days. The United States lacked this capability to raise such forces quickly and traditionally required significant time to raise, equip, train, and deploy a large standing army. Of course, these limitations mattered little in a period when strategic threats would have to attempt a long and arduous overseas mission. To combat a potential overseas invasion, the United States undertook systematic efforts to strengthen coastal defenses, and by the late 19th century, it maintained relatively large naval forces to meet overseas threats.

The Civil War marked a change in mobilization as it established the authority of the federal government to raise armies directly through the draft. Initially, the federal government relied on volunteers to fill the ranks with the troops necessary to suppress the Southern rebellion. In the end, however, these volunteers proved inadequate, and the U.S. Congress responded by passing the Enrollment Act of March 3, 1863. Conscription raised relatively few troops for the North and was met by massive resistance in places such as New York City, but it did establish an important precedent.

The federal government developed no systematic plan for industrial mobilization in wartime during the Civil War. The North's industrial base remained sufficient to supply the Union war effort, especially in providing sufficient weaponry and naval vessels. Technological advances in armaments tended to be the work of private capitalists, and not until the Cold War did the federal government systematically underwrite the cost of research and development in peacetime.

The brief war with Spain in 1898 underscored the problems of wartime mobilization. Although the United States had little problem raising a sufficient number of volunteers, it proved much more difficult to equip, train, and deploy them overseas. Volunteer units that converged on Tampa were supplied by a single railroad line. Soldiers died from consuming contaminated rations, and the U.S. Navy struggled

to find enough vessels capable of deploying expeditionary forces to Cuba.

The trials of the Spanish-American War prompted calls for reform in the organization of the War Department and helped further the adoption of a general staff that would oversee planning and mobilization. That general staff was miniscule in comparison to those of Germany, France, and other European powers, but its creation established another important precedent.

U.S. Mobilization During the Age of the World Wars

World War I marked a shift in how the United States raised military forces by abandoning the volunteer system and implementing a conscription-based selective system. The United States raised an army of 3 million, but it continued to face problems in training, equipping, and deploying these forces overseas. Although the United States declared war in April 1917, most combat divisions did not enter battle until the summer of 1918.

World War I represented the first systematic effort to mobilize the entire American economy in support of a war effort. Most of these responsibilities rested in the hands of civilian agencies of the Council on National Defense and the War Industries Board. Industrial mobilization efforts proved inadequate. American shipbuilders were unable to build enough vessels, forcing the United States to rely on British and French ships to supply their forces in Europe. The United States never deployed an American-made aircraft to France during the conflict, and American aviators flew European models for the duration.

A number of institutions were established during the interwar years that allowed military leaders to consider ways to effectively mobilize for another major war. The National Defense Act of 1920 authorized mobilization planning by the Assistant Secretary of War, and the War Plans Division was established as part of the General Staff in 1921. In 1924, the War Department created the Army Industrial College that studied in-depth questions of mobilization.

Mobilization planning was stifled during the interwar years by sharp cuts in defense spending in the 1920s and early 1930s that stemmed in part from strong pacifist sentiment within American society. When Franklin D. Roosevelt assumed the

presidency, he funded the construction of several naval ships using funds appropriated from public works projects; however, the political climate prevented him from increasing defense spending appreciably.

The beginning of World War II and the fall of France led to the most dramatic peacetime mobilization in American history. At the behest of Roosevelt, Congress implemented peacetime conscription in 1940 for the first time in American history. Using executive authority, Roosevelt mobilized the National Guard into federalized service. Industrial production soared even before the United States entered the war after the attack on Pearl Harbor, as the United States purchased weapons and materiel to outfit a growing military as well as provide support to Great Britain and the Soviet Union under lend-lease. To coordinate economic mobilization, the Roosevelt administration created a series of mobilization boards to integrate war plans with industry. Although unprecedented compared with earlier conflicts, these efforts remained insufficient to fully prepare the United States for a global war that ultimately required the raising of armed forces numbering more than 15 million.

Once the United States entered the war, manpower, housing, and equipment shortages plagued reception and training centers, especially with the influx of new recruits. Supply and shipping problems continued even as the army began operations in North Africa in 1942. Problems continued throughout the war, but the United States eventually shipped an unprecedented amount of men and materiel to both the European and Pacific theaters through 3 years of Herculean efforts by the government, the U.S. industry, and the American populace.

Cold War Mobilization

To a degree, the United States never fully demobilized from World War II. Major structural changes were made to increase military preparedness under the National Security Act of 1947, which created the National Security Council, the Department of Defense, and the Joint Chiefs of Staff. Although the budget for ground forces and the navy was dramatically reduced after World War II, national leaders invested substantial resources in the air force, viewing the atomic bomb as the most effective and cost-efficient way to defend the United States. Moreover,

the United States maintained a significant presence in Europe and, under the North Atlantic Treaty Organization of 1949, committed itself to defending Western Europe. A reliance on nuclear weapons and air power resulted in massive peacetime spending on weaponry that became evermore technologically sophisticated and expensive. In an age of nuclear weapons, the idea of free security vanished, and national and military leaders recognized that the United States must be prepared to mobilize quickly for a possible war with the Soviet Union.

The United States was unprepared for the Korean War and lacked adequate ground forces in the early months of the conflict. When North Korea invaded South Korea on June 25, 1950, President Harry Truman intervened without hesitation. The Pentagon ordered the Eighth Army, on occupation duty in Japan, to Korea to halt the communist offensive. The army cannibalized stateside units to provide for the Eighth Army, which had suffered from interwar cuts. Truman purposely decided to keep the war as small as possible to reduce its effect on the U.S. home front. He saw the events in Korea as a conflict rather than a war, a small part of a much bigger fight against communism. U.S. industry never converted to full war production as it did during World War II, but within a year, the United States and its allies moved enough manpower and equipment to Korea to reach a stalemate that lasted from 1951 to 1953.

In the aftermath of the Korean War, President Dwight Eisenhower pursued cuts in conventional forces to reduce defense spending and relied on America's nuclear arsenal for deterrence. Beginning in the 1950s, America's nuclear forces could be mobilized in a matter of hours and American policymakers worked to strengthen command and control structures in order to allow the president and military leaders to meet an unexpected nuclear attack. By adopting the policy of flexible response, President John F. Kennedy continued to maintain large nuclear force structures but also oversaw a buildup of conventional forces.

The mobilization of materiel for the Vietnam War caused few problems since by this time the United States had become accustomed to a permanent overseas military commitment to stem the spread of communism. The military and its industrial support base developed a relationship that allowed the United States to mobilize for war without any

reduction in domestic consumption. The mobilization of manpower, however, created huge problems. High numbers of casualties and the escalation of the war forced the selective service to induct more middle-class White males by the late 1960s. This caused a huge backlash on the home front. Media attention and the proliferation of television sets in American middle-class households combined to draw more public attention to the negative aspects of the war. Opposition grew and included widespread protests, marches against the war, and, in some cases, draft dodging. Ultimately, the divisiveness of the Vietnam War and the tarnished reputation of the draft system led the U.S. government to end the draft and replace it with an all-volunteer military.

The All-Volunteer Military

The 1970s witnessed the development of the all-volunteer military and, initially, a substantial drawdown of American forces. This trend would be reversed by President Jimmy Carter, and under his successor, Ronald Reagan, the United States embarked on an unprecedented rearmament program. On the manpower side, the Department of Defense underwent reorganization that embraced the concept of joint operations between services, redefined the status and role of reserve and National Guard forces, and established liaison roles within the military to improve the acquisition process with the defense industry. Worldwide military commitments, the threat of communism, and the growth of the defense industry led, in the 1980s, to a permanent state of mobilization.

The Wars in Iraq and Afghanistan

The massive force buildup during the Cold War proved invaluable during the Persian Gulf War. Although it took the United States and its allies time to build up sufficient forces in the Persian Gulf to wage war against Iraq, the ground war ended with a stunning victory in only 48 hours. Moreover, the Persian Gulf War reaffirmed the decision of Pentagon planners to make greater use of reservists and National Guard units in the event of a major conflict.

The attacks of September 11, 2001, did not lead to a call for a major mobilization of American society in the Global War on Terrorism. In fact, Secretary of Defense Donald Rumsfeld implemented

a strategy that called for reduced force structures and a greater reliance on air power and Army Special Forces. Although the U.S. forces and allies managed to achieve quick conventional victories against the Taliban regime in Afghanistan and against Saddam Hussein in Iraq, they were ill prepared for the long-term insurgencies that subsequently developed. This placed a significant strain on both regular forces and reservists and National Guard units called into service. As a result, it was not uncommon for reservists and National Guard troops to undertake three or more overseas combat deployments.

Conclusion

Since their conversion to an all-volunteer recruitment military, U.S. forces have maintained a mobilized force around the world. The U.S. military has fought in numerous conflicts, some more controversial and problematic than others, over the past 30 years. The nature of mobilization is such that the home front has remained relatively unaffected by these commitments. The federal government's reliance on the defense industry to provide materiel and on defense contractors to provide service and supply chain management has prevented the need for wider industry to convert to wartime production. Regular industries simply no longer need to convert their production to war materiel, nor does the military require enormous amounts of manpower. Ten plus years of persistent conflict have stretched this system of mobilization to its limits, but there is currently more political support for reducing military commitments than there is to expand mobilization.

MODULAR ARMY

Beginning in September 2003, Army Chief of Staff General Peter Schoomaker implemented a radical shift in the U.S. Army from its traditional division-based structure toward a brigade-based modular army. This ongoing transformation of the army resulted in the combined arms brigade combat team (BCT) becoming the centerpiece of army organization. BCTs will be attached to a higher, stand-alone headquarters—a division, corps, or theater army—as part of a formation tailored for operational requirements. BCTs as well as other modular multifunctional support brigades and single functional brigades will be pooled for use as part of expeditionary forces that enhance the flexibility and responsiveness of the army to joint and coalition task forces. This entry discusses the background, implementation, and assessment of the modular army.

Background

Between World War II and the 1990s, the army expected fixed-structure divisions to participate as key parts of large land forces operating in Cold War campaigns, mostly in Europe or Asia. These campaigns envisioned large forward-deployed forces in well-established theaters having significant nondivisional units providing support at specific echelons. By the 1990s, this organization made it difficult to deploy units apart from their divisional base and keep the rest of the division ready for other missions. Post-Cold War, the army needed to rapidly employ land forces at the outset of a contingency, resulting in deploying parts of divisions for specific missions. Force tailoring frequently rendered the residual portion of the parent unit incapable of continuing its full range of missions due to loss of key personnel or equipment. Consequently, the army wanted to reorganize around smaller, more versatile formations to ease deployment.

In January 1995, the army issued a “Concept for Modularity” that called for responding to an

increasing array of potential deployments with more efficient packaging of forces. That concept defined modularity as a force design methodology that established a means of providing force elements that are interchangeable, expandable, and tailorable to meet the changing needs of the army at echelons above division level. In the mid-1990s, some serving army officers, such as Douglas Macgregor, also recommended reorganizing divisions of the army on a brigade basis.

Operations in Afghanistan and Iraq finally convinced the army to consider extending modularity to the division level. The nature of modern land operations had become increasingly distributed in space while more simultaneous in time. At the tactical and operational levels, army subordinate units routinely operated in noncontiguous areas. This contrasted sharply with the contiguous and hierarchical arrangement of land forces prevalent in the past. In addition, the army increasingly provided the majority of land component command and task force headquarters for joint and multinational contingency operations. More agile forces, improvements in command and control, proliferation of satellite-based communications, and continuing integration of joint capabilities at lower echelons all contributed to the necessity for change.

Implementation

Shortly after becoming army chief of staff in 2003, General Schoomaker created 16 focus groups to make up Task Force Modularity. He charged the task force with redesigning the army from a division-based to a modular brigade-based force to achieve three primary goals:

1. To increase the number of available BCTs as capable as their predecessors to meet operational requirements
2. To create brigade-size combat support and combat service support formations of common organizational designs
3. To redesign all organizations to perform as integral parts of the joint force across a range of military operations and enhance their ability to contribute to joint, interagency, and multinational efforts

This modular force conversion converted all army units from Cold War formations to more

deployable and versatile modular formations based on standardized organizations for both the active and reserve components. As of 2011, this included 73 modular BCTs and approximately 229 support brigades and enabling organizations. This transformation of the army also reorganized the headquarters of the operational army, including theater army headquarters, theater support commands, and corps and division headquarters.

BCTs form the basic building block of the army's modular tactical force. They are the principal means of executing engagements. Three standardized BCTs exist: (1) heavy, (2) infantry, and (3) Stryker. Battalion-sized maneuver, fires, reconnaissance, and sustainment units are organic to BCTs. Higher commands can further task-organize BCTs for specific missions with capabilities not organic to the BCT. Augmentation might include aviation, armor, artillery, air defense, military police, civil affairs, psychological operations elements, or engineers. This organizational flexibility allows BCTs to function across the spectrum of conflict.

The modular army retains a mix of three higher headquarters that are not a rigid hierarchy and do not require a standard array of forces. The theater army focuses on combatant command-level landpower employment. It supports joint, interagency, intergovernmental, and multinational forces within a combatant commander's area of responsibility. The corps provides a headquarters that specializes in operations as a land component command headquarters, as a joint task force for contingencies, or as an intermediate tactical headquarters to supervise divisions. The division is optimized for tactical control of a mixture of brigades during land operations and is the army's primary warfighting headquarters. All three headquarters are stand-alone, modular, and designed to use forces tailored for specific operations.

Five types of modular multifunctional support brigades complement the BCTs: (1) the battle-field surveillance brigade, (2) the fires brigade, (3) the combat aviation brigade, (4) the maneuver enhancement brigade, and (5) the sustainment brigade. These brigades provide the expertise to command and control various unit types. More than one type of support brigade may be task-organized to a division or corps. In turn, commands may make these brigades available to support other services.

Assessment

Modular BCTs have proven themselves extremely powerful and effective on today's battlefields. However, under modularity, field artillery units have been reduced and support units have suffered due to piecemeal deployments that violate habitual assignments. In addition, BCTs with only two primary maneuver battalions have been criticized for a lack of combat power and engineers. The Government Accountability Office has also criticized the modular army due to the cost of converting all units, active and reserve component, to standard designs complete with modern enablers. Fourteen army division commanders surveyed in 2009 by Lieutenant General Mark Hertling agreed that while modularity is a great concept, the army has made being a Modular Brigade Commander the toughest job in the army. Exacerbating this has been the delinking of brigades from their higher headquarters and the lack of dedicated divisional troops, which has caused these commanders to recommend rebalancing brigade and division responsibilities and functions.

MORALE

Combat soldiers experience varying degrees of emotions during their service. What initially drives a soldier to enlist is constantly shaped and changed by the physical, inherent, and material conditions the soldier faces during combat. Therefore, the larger events of the war such as battles, public opinion, and conditions affect individual soldiers and their overall motivation. The morale of soldiers is constantly in flux as several factors, both in the larger scope and at a microlevel usually known as the unit, affects their purpose and will to fight. According to the U.S. Army, *morale* is defined as the mental, emotional, and spiritual state of the individual. It is how he or she feels happy, hopeful, confident, appreciated, worthless, sad, unrecognized, or depressed. Collectively, psychologists, historians, and military leaders have analyzed how soldiers perceive morale and how the morale of individuals affects their performance in battle. Apart from the fact that different wars have different circumstances, these scholars came to a consensus that morale is an

inherent concept that is exhibited through a soldier's participation in a group. A recent scholar, Frederick Manning, synthesized the literature to argue that morale is built through a commonality built on and expressed through small group cohesion. Because morale is rooted in the soldier consciousness, it often runs parallel to the notion of soldier ideology and motivation. The larger question that dictates the concept of morale is what exactly motivates a soldier to fight. This entry examines morale—what contributes to it and what diminishes it.

Defining the Concept of Morale

Soldiers' motivation is their own ideological convictions and how these are interwoven into the larger narrative and cause of war. Motivation can be broken down into two stages: first, as initial motivation or, in other words, what drives the individual to enlist; second, as sustained motivation, or what pushes the soldier to continue. The initial motivation to fight is often challenged by the violence, hardship, and experience of war. However, soldiers and scholars alike argue that soldier ideology can sustain morale if the alternative to victory is severe enough. The Civil War historian James McPherson argues that a majority of soldiers felt an inherent sense of duty and honor that perpetuated good morale. In addition, Earl Hess argues that soldiers were able to synthesize a variety of ideologies such as family, ideology, manhood, and other cultural discourses to reshape the way they saw war in order to stay the course. Similarly, the historian of modern warfare Hew Strachan asserts that political ideology connects the armed forces to the home front and gives purpose to their duty and sacrifice. Thus, while at first, soldiers are often motivated by an ideological purpose, if that ideology no longer outweighs the deadly alternatives, the driving force behind their motivation evolves into a much more localized cause at a microlevel.

Small Unit Cohesion

Arguably, the most significant contributor of morale is the unit, or the cohesion between a soldier and those around him or her. For soldiers who are unhappy with material conditions, leadership, and loss, the small unit is the closest and the most visible source of empathy. In reflection of his own experience in World War II, S. L. A. Marshall

characterizes morale as an inherent feeling that allows an infantry soldier to keep going, despite eminent danger, because of the near-presence of a comrade. The relationships soldiers make throughout hours of training, travel, downtime, and experience play a crucial role in sustaining them in battle. Small group, or unit, cohesion arguably overshadows the larger causes and is what ultimately sustains the soldiers over the course of sustained periods of combat. While small unit cohesion allows soldiers to sustain motivation, what factors contribute to disillusionment and challenge morale?

Challenges to Morale

The most obvious factor that affects a combat soldier is the ever-present fear of the unknown, death, and the very nature of war itself. In other words, soldiers are constantly under the stress of danger, death, and loss. Even for soldiers who enlist and fight for the most ardent cause, the reality of war affects individuals to their very core during battle. Soldier ideology, whether initial or sustained, is often tested by both the exposure to bloodshed and length of their service. When a soldier is exposed to the horrors of battle, the first priority is survival, and often the need to endure combat is more important than any ideology. While soldiers' motivation for fighting is often warped by injury and loss of comrades, battle fatigue also plays a major role in morale. In the War in Afghanistan, some soldiers complained of tiredness and mental illness because of the longevity of the conflict.

The second factor that affects soldier's morale is their relationship with the higher command. According to military historians' and veterans' accounts, soldiers often feel as if there is a disconnect between their own goals and the aims of their leaders. Also, soldiers contemplate whether their commanders are more concerned about personal gain and promotion rather than the well-being of their troops. Historians who study soldier discourse and consciousness to understand what shapes soldiers' emotions often correlates low morale with the lack of faith or trust in their officers.

Along the same lines, public opinion and policy toward the war can affect soldier morale. Soldiers are not immune to newspapers and other forms of social media. Thus, if support for the war at home is dwindling or if public opinion of the war is negative,

soldiers can feel ostracized without the backing of the people they are fighting to protect. Scholars of the Vietnam War correlate antiwar activists and their movement's direct effect on the deterioration in U.S. troop discipline and morale in Vietnam. Also, with regard to policy, soldiers may feel that politicians who make decisions from a safe distance, known as "armchair generals," are making larger negotiations that will filter down to their level. Sometimes the phrase "rich man's war, poor man's fight" comes to mind when the soldiers feel that their safety and best interest are not at heart when politicians or senior military leaders make what they perceive as corrupt or misleading decisions. For example, during the Civil War, the Union Army of the Potomac experienced discouragement in the ranks because of the rise of the Copperheads, political bickering in Washington, and the controversy over emancipation. Similarly, during the War in Iraq, controversy arose over antiwar protesters and their effect on the morale of soldiers. These instances of policy and public opinion can affect soldiers' consciousness even in the event of victory. Some of these tensions are inevitable, given the civilian control of the military, with ultimate decision making regarding questions of war and peace in the hands of the elected officials and the American people.

Finally, material conditions can affect the morale of soldiers. Even if the army is winning battles, if soldiers' basic needs are not met, morale is deeply affected. For example, if the soldiers are uncomfortable and not satisfied with their conditions, regardless of how well the unit is performing, they will not be mentally or physically well equipped. For example, during the Civil War, Confederate soldiers throughout the war, especially during the Petersburg Campaign, were starved, struggled with disease, and lacked clothing and shoes. Also, if soldiers are not given proper medical treatment or equipment to prevent disease, they will not be comfortable and safe. While discontent with material conditions can be show obvious among the ranks, morale is not always as visible, and thus this inherent trait can be understood through soldier actions on and off the battlefield.

Measuring and Sustaining Morale

How then is soldier morale exemplified? Arguably, high morale is often seen through attention to detail, confidence, and success in battle. Most significantly,

victory perpetuates high morale. Victory in battle boosts soldiers' morale and gives them a more positive attitude toward the next battle, whereas defeat lowers morale and causes many soldiers to ponder if continuing to risk their lives is still worth it. Low morale is shown through dissent, mutiny, and desertion. However, desertion is not the only reaction to disillusionment; just because soldiers remain in their ranks does not mean high morale is prevalent. Often, the loss of comrades, homesickness, and battle fatigue all contribute to discouragement.

Currently, the military has considered strategies to elevate morale. While the military cannot control every individual's reaction to combat, modern tactics promote a plan for sustaining morale. The most notable of these implementations is training. The U.S. military has developed training, education, and preparation not only for sustaining the physical demands but also for coping with the mental and psychological stress and trauma that can happen. One of the major components to this training is demonstrated through vertical bonding, horizontal bonding, and commitment education. The U.S. military requires soldiers to form relationships vertically, as in similar rank, in order to lay the foundation for small unit cohesion. Also, to stimulate trust between soldiers and their commanding officers, commanders are required to get to know their soldiers on a personal level. Finally, training strives to instill a code of values and commitment in oneself that is clearly visible and mutually upheld. Each unit has its set of standards and trusts that every other unit holds one itself to the same principles. This mutual trust, founded soundly within the small unit, instills values of trust, loyalty, duty, courage, and honor and spans both vertically and horizontally among the ranks. This type of commitment education establishes a highly cohesive military unit that requires some degree of personal commitment by every unit member. Achieving continuity between units in regard to disciplinary actions, goals, routine inspections, social interaction, and communication can help in initially obtaining and thoroughly sustaining high morale during the challenges war brings.

Throughout history, Americans fought in wars at home and abroad for different ideological purposes, but one common thread embedded within these different circumstances is the concept of morale. While several factors affect a soldier's morale, it is difficult to measure an inherent trait that can change from day to day based on the material conditions,

sentiment on the home front, relationship with their commanders, and the tide of the war, to name a few. While victory and survival are the most obvious forces of motivation, small unit cohesiveness is the strongest attribute to morale for soldiers, regardless of the era. Small unit discourse and its role in sustaining a soldier's will to "keep going" aids in coping with the widespread loss, death, and fear of a combat soldier's experience.

MOTIVATION

No issue is more perplexing to military historians than why people fight. Soldiers have been asked this

question by family, media, and authors over the centuries and throughout the nations of the world, and it is difficult to answer because each individual possesses his, and in recent times her, own motivation. This entry provides background on the issue and explores the various ramifications of that question.

Background

Throughout history, most armies have included both conscripts and volunteers, officers and enlisted men, and combat and combat support soldiers. In the wars of the 20th and 21st centuries, only 10% to 20% of those who serve in military units actually fight. The vast majority of any unit performs tasks that logistically support those on the battlefield. The histories of the two World Wars provide evidence that conscripts from all sides were frequently trained to fight, because they did not possess the skills necessary to serve in noncombat roles. Thus, infantry units were often made up of the less educated, lower socioeconomic classes who, the leaders believed, could easily be trained to kill.

But the limited wars of Korea and Vietnam required a different kind of soldier, one who could adapt to the changing battlefield scenario and who could interface with local populations and “win the hearts and minds” of the people. Such a soldier had to be better educated than his predecessor, more culturally aware, and appreciative of his environment. Once on the battlefield, each soldier has to charge toward the enemy as part of a unit. It is on this issue that military historians have debated the motivation to fight.

Traditional Versus Cynical

The traditional but somewhat romantic view of combat motivation holds that people fight because they believe in a cause, the ideology of their nation, and that they are driven by what they believe to be the “right” side of an issue. Leaders who can motivate their soldiers by explaining the reasons why they are fighting will have the most battlefield success because their soldiers will “buy into” the mission and will accept their fate if ultimately they must die. And they would do so for the cause if their leaders, either civilian or military, can speak to the mission in terms that the average soldier can understand.

The more cynical but generally accepted explanation for “why people fight,” at least in the limited

wars of the 20th and 21st centuries, is that it’s for their “buddy” in the foxhole or next to them in an operation. They do not need to know why they were sent there, why their nation has chosen these people as the enemy, or what political circumstances necessitated the battle they are about to fight. Only the needs of their fellow soldiers are important. The “limited” wars of Korea, Vietnam, and Desert Storm and the wars of the 21st century, such as Operation Iraqi Freedom in Iraq and Enduring Freedom in Afghanistan, are examples that are frequently cited as not being ideologically driven wars.

A more focused examination of these two schools of thought on the motivation to fight reveals some overlap of the theories. The “cause” school places the burden of mission explanation on either the civilian or the military leadership. Those who fought in the American War for Independence knew that victory against Britain would bring the freedoms outlined in the Declaration of Independence. No cause could have been better defined, at least by 1776. But if the cause was so obvious, why did soldiers desert to return to their farms, and why were French mercenaries and officers needed to supplement and train colonial soldiers? Why did General Washington have such difficulty in obtaining the funds, arms, and clothing necessary to keep his army on the battlefield? Once President Abraham Lincoln found a general to lead his Union Army, he still was not able to effectively articulate the cause as the elimination of slavery. Had that happened, Union soldiers may have readily accepted Black soldiers into their ranks, thus improving the likelihood of a rapid defeat of the Confederacy. General William T. Sherman is often given credit for motivating his Union Army as they made their final push to the sea, but by the time that final assault was made, resistance from the Confederate Army had declined considerably. And General George Patton is given credit for successfully defeating Erwin Rommel’s forces in North Africa in Operation Torch, then quickly leading his men to reach Messina in Sicily. His men fought effectively in both campaigns, but the extent to which the cause motivated them is questionable.

If leaders are critical for the success of the mission, they become as important as the soldiers in defeating an enemy on the battlefield. Yet the leaders seldom fire a shot, advance into enemy fire, or risk their lives to save the wounded. Those responsibilities are on the shoulders of the fighting men

and, more recently, women. In the limited wars, we know that conscripts braved the cold and snow in Korea and fought bravely at Inchon and against the Chinese troops that leaders believed would not cross the border. In Vietnam, draftees fought alongside reluctant volunteers at Ia Drang and Khe Sanh. And the rhetoric of the leaders mattered little as they fought to save their buddy next to them when the cause did not seem relevant, pertinent, or supported by the society that sent them to war.

The debate continues toward the wars in Afghanistan and Iraq. With the all-volunteer force having been established in 1973, today's soldiers continue to be motivated to perform their duties to the satisfaction of those who serve with them.

MUSEUMS, MILITARY

Military museums can be roughly divided into three categories. Governments operate museums of varying sizes to commemorate the accomplishments of their respective armed forces, and these can be considered to be national military museums. To commemorate particular engagements or locations, battlefield museums are located at, or near, particular historic sites. Finally, individual units such as regiments or batteries often maintain organizational museums. These might merely be collections of trophies located in the officers' mess (a tradition already well established in the British army by the early 19th century), or can take the form of more formal museums. Many of these sites are nationally or state owned and operated, although numerous

institutions are privately owned and operated. This entry discusses the origins and objectives of military museums, and describes U.S. armed forces museums and major world military and battlefield museums.

Origins

The capture and display of trophies by a victorious army have been recorded far back into antiquity. In England, public demonstrations of seized arms and armor in the White Tower of the Tower of London are documented to have occurred as early as 1489. The ceremonial display of these captured trophies, and triumphant return of these trophies to an army's home and consequential public veneration, can be considered to make up the first military museums.

Within the United States, artillery pieces from the British army of Lieutenant General Jonathan Burgoyne captured and surrendered at Saratoga in 1777 were carefully marked and, although remaining in active duty with the Continental army, were regarded as valued trophies. Beginning in 1782, the Continental army inscribed captured artillery pieces and presented selected cannon to distinguished officers such as the French commander at Yorktown, Lieutenant General Comte de Rochambeau, and the American general Nathaniel Greene. These cannon were proudly displayed at what became known as "Trophy Point" at West Point as early as 1780. By 1854, the U.S. Army opened the first purely military museum in the nation at West Point, at approximately the same time as the U.S. Navy began a committed effort to safeguard and preserve military relics and trophies acquired in engagements and excursions throughout the globe. Other nations rapidly followed this precedent.

Objectives

Regardless of their size and scope, military museums are typically established with consistent purposes and missions.

Museums serve as a venue for military history study. They serve as a repository for military weapons, uniforms, and equipment from previous campaigns and historic eras. Many collections may contain numerous pieces of equipment, thus providing a large representation of local variations and manufacturers. The U.S. National World War I Museum at Liberty Memorial, Kansas City, Missouri, contains hundreds of U.S. uniforms of

World War I. Many collections also contain the official patterns and samples of specific military uniforms, arms, and equipment. The U.S. Army Quartermaster Museum at Fort Lee, Virginia, contains all the official U.S. Army Quartermaster patterns. Museums may also contain focused collections obtained from foreign entities during conflicts. The West Point Museum contains one of the world's foremost Plains Indians collections, obtained by purchase or capture by the numerous West Point graduates who served and fought on the American Great Plains throughout the 19th century. Many of these museums contain highly focused libraries and archives to facilitate research and are among the foremost such institutions in the world. Examples of these are the World War I and World War II archives on the Canadian army located at the Canadian War Museum in Ottawa and the World War I-focused collection at the U.S. National World War I Museum at Liberty Memorial, Kansas City, Missouri.

Military museums provide venues for military history instruction and training and, in turn, facilitate modern military training and instruction prior to deployments. Numerous institutions such as the West Point Museum provide access to their collections to support cadet history classes. West Point, in fact, has a state-of-the-art classroom specifically configured for this purpose. The West Point Museum also maintains a collection of fully functional, well-maintained original arms to provide cadets with an annual opportunity to actually fire these rare historical weapons.

Military museums serve as important venues for commemoration of significant military and historic events and as sites for contemplation of sacrifice. The Canadian War Museum contains a chapel and memorial area and the tomb of Canada's Unknown Soldier from World War I. The spectacular Falklands Islands Memorial Chapel in southern England performs this service for the 255 British servicemen who died in the Falklands Conflict of 1982 in the South Atlantic. At the heart of the Verdun battlefield, the *Ossuaire de Douaumont*, surrounded by the marked graves of 15,000 known French dead, contains the remains of a horrific 130,000 unknown dead (French and German) in its vaults and provides visitors with a contemplative chapel.

Military museums, particularly regimental museums and collections in mess rooms, serve to preserve and commemorate unit esprit and traditions. The

Le Musée de la Légion étrangère, the Museum of the French Foreign Legion at Aubagne in southern France, contains the wooden hand of Captain Jean Danjou, whose hand was sacrificed at the Battle of Camerone on April 30, 1863. Arguably the most sacred relic of the French Foreign Legion, it is paraded annually by the Legion on the anniversary of the battle. Nearly every military organization possesses at least a handful of relics garnered on fields of strife in which it has participated, and that are proudly displayed in a hallway or orderly room in its garrison headquarters or billets.

Finally, in the case of private museums in particular, military museums support, facilitate, and encourage heritage tourism and attendant economic tourism benefits to the adjacent community. Fort Ticonderoga Museum, a privately owned and operated museum at Fort Ticonderoga (an 18th-century citadel) in upper New York state is a superlative example of this, and this museum has served as the principal economic factor within that community since the closing of numerous industrial plants following World War II.

U.S. Armed Forces Museums

U.S. Army

The U.S. Army currently does not have a dedicated U.S. Army institutional museum. The U.S. Army Education and Heritage Center is in the process of establishing an Army Heritage Museum and attendant living history facility at Carlisle Barracks, Pennsylvania. Primarily based on the library and archives of the U.S. Army Military History Institute, this facility was partially opened to the public in 2007. A private organization, the Army Historical Foundation, is currently performing fund-raising and planning for a National Museum of the U.S. Army to open at Fort Belvoir, Virginia. The United States Military Academy at West Point and two U.S. Army Commands operate a range of museums throughout the nation.

West Point Museum. Established at West Point as early as 1780, formal collections were established at Trophy Point and the Ordnance Compound shortly after the Mexican-American War as the repository for captured artillery pieces brought back by the academy graduates from the Mexican-American War of 1846–1848. The museum first opened to the public in 1854.

In 1989, it moved to Olmsted Hall on South Post in Highland Falls, where it remains. This off-post location ensures that the museum will remain accessible to the public regardless of security conditions.

Training and Doctrine Command (TRADOC). The U.S. Army TRADOC “develops, educates and trains soldiers, civilians, and leaders; supports unit training; and designs, builds and integrates a versatile mix of capabilities, formations, and equipment to strengthen the U.S. Army as America’s Force of Decisive Action” (<http://www.tradoc.army.mil/>). As its name implies, TRADOC is responsible for training soldiers (individually and organizationally) and for establishing army-wide military doctrine. TRADOC operates a range of tactical schools such as the Infantry School, Armor School, and Fires School; various support schools such as the Quartermaster School, Signal School, Medical School, Military Police School, and Aviation School; and a number of educational schools such as the Sergeant Major’s Academy, Command and General Staff College, and War College. TRADOC has always considered military museums to contribute to its training mission and has strongly supported the development, growth, and utilization of army museums as an integral component of its vigorous military history instruction and education program. Numerous TRADOC commands and installations operate superb military museums.

Forces Command (FORSCOM). The U.S. Army FORSCOM “prepares conventional forces to provide a sustained flow of trained and ready land power to Combatant Commanders in defense of the Nation at home and abroad” (<http://www.forscom.army.mil/>). Although FORSCOM operates numerous military museums, predominantly organizational museums such as the 82nd Airborne Division Museum, the Don F. Pratt Museum (101st Air Assault Museum), and 10th Mountain Division Museum, these have typically been constrained by inadequate funding and have not received command emphasis or attention. Those museums that are relatively large and modern have been forced to generate nearly all of their own revenue. The result has been that the U.S. Army organizational museums are generally neglected. This is considerably at variance with the British and Canadian model, where maintaining organizational history and relics is considered to be at the heart of regimental morale.

U.S. Air Force

The National Museum of the U.S. Air Force is the oldest military aviation museum in the world established at McCook Army Airfield near Dayton, Ohio, in 1923 following the end of the First World War, as a collection of U.S. and foreign World War I aircraft. In 1927, the collection was moved to Wright Field in Dayton, and in 1954, the museum began to display full-sized aircraft. It was formally designated the Air Force Museum in 1956 and moved into its current location at Wright-Patterson Air Force Base in 1971. It contains one of the foremost collections of military airplanes and aviation items in the world.

U.S. Navy

The U.S. Navy in the 19th century established learning schools, or Lyceums, at most of their large shipyards. The tradition of collecting naval artifacts and trophies in the United States began in the early 19th century under Thomas Tingey, the first commandant of the Washington Navy Yard. The initial artifact collected was a French gun, cast in 1793 at Lyons, captured during the Quasi-War with France (1798–1801). The various Lyceums and early trophy collections make up the core of the current U.S. Navy museum system.

National Museum of the U.S. Navy. This museum was formally established in 1961 at the Washington Navy Yard and opened to the public in 1963. It is a component of the U.S. Naval History and Heritage Command, which operates 12 official U.S. Navy museums throughout the nation, and the Navy Department Library and Naval Historical Center, also at the Washington Navy Yard.

Naval Academy Museum. The museum originated as the Naval School Lyceum, established in 1845 under the academy’s first chaplain. The Lyceum was a collection of historic and natural objects, scientific models and apparatus, and works of art brought together for study and discussion by the Naval Academy Cadets. In 1849, President James K. Polk directed that the navy’s collection of historic flags be sent to the new Naval School at Annapolis for care and display. Other trophies of war soon followed. A permanent museum building was subsequently constructed at Annapolis in 1939 and still remains in use.

USS Constitution. Still a commissioned ship of the U.S. Navy, continuously in commission since its construction in 1797, the *USS Constitution* is docked at the historic Boston Naval Yard, Charlestown, Massachusetts. It is a distinctive floating museum, and remains the most distinguished ship in the history of the U.S. Navy.

Major World Military Museums

Imperial War Museum, London. In 1917, it was determined that a National War Museum should be established to collect and display material relating to the Great War, then still being fought. Formally established by Parliament in 1920, although the museum's original focus was the "Great War" (subsequently known as World War I), it now serves to interpret all military operations in which the British and the British Empire's military forces have been engaged since 1914.

National Army Museum, London. The National Army Museum tells the story of the British army from its inception through the ongoing operations in Afghanistan, with the focus on the numerous imperial campaigns of the 18th and 19th centuries. It is located on the grounds of the Royal Hospital at Chelsea. Like most museums, it contains a particularly well-regarded archival and research facility.

HMS Victory, Portsmouth. A floating museum like the *USS Constitution*, *HMS Victory* was Lord Nelson's flagship at Trafalgar and has been maintained as a living monument to the 18th-century Royal Navy, the "Heart of Oak" that protected England's overseas Empire.

Canadian War Museum, Ottawa. This superb institution moved into a massive modern facility in 2005, located in a beautiful location in downtown Ottawa adjacent to the Ottawa River. A massive museum gallery interprets Canadian military history from the colonial era to the modern peacekeeping era. Its exhibit areas for World War I and World War II are particularly comprehensive. A mammoth basement arena contains scores of armored and wheeled vehicles, constituting one of the most extensive motorized military vehicle collections in the world. It also contains a research facility focused on the Canadian military experience, particularly in the two World Wars.

The Royal Museum of the Army and Military History, Brussels, Belgium. One of the major military museums of Europe is located at the center of Belgium, known as the "Cockpit of Europe" for its pivotal location of centuries of military contests. Its World War I collections, during which a small but gallant Belgium army maintained national survival, are particularly robust.

Musée de la Armée, Paris, France. The museum is contained in the Hall of the Invalids, originally constructed by King Louis XIV in 1641 to serve as a hospital for crippled or retired French soldiers. Today, it preserves centuries of French military traditions and accomplishments. Its most impressive and most frequently visited exhibit is the Tomb of Napoleon, still the site of an annual pilgrimage by cadets at the French Military Academy of Saint Cyr.

The Falkland Islands Memorial Chapel. Not properly a museum, this is predominantly a memorial chapel to the fallen British soldiers, sailors, and airmen of the Falklands Conflict. Dedicated by Her Majesty Queen Elizabeth II in 2000, it contains small but exceptional museum galleries within the wings of the chapel; a Library that allegedly contains every book written about the Falklands War; and a small, but continuously expanding, archive of primary source materials. It includes a spectacular and moving outdoor memorial garden. Every year, to commemorate the termination of hostilities on June 14, 1982, a special service of thanksgiving and remembrance is held at the chapel.

Central Armed Forces Museum, Moscow, Russia. First established in 1919, this museum is dedicated to the military history of the Soviet Union and Russia from the 1917 Revolution until today. It has a massive collection of 20th-century Soviet and Russian military historic items and holds more than 700,000 individual artifacts. The most valuable are displayed in the 25 exhibit galleries of the museum. The museum's particularly strong collections from World War II constitute one of the most significant such groupings in the world.

Battlefield Museums

These museums, more commonly called visitor centers, are typically located either on the periphery or,

in many instances, on hallowed ground at battlefields or significant military history sites.

Ossuaire de Douaumont, Verdun, France. Located in the midst of the battlefield of Verdun on the Ridge of Thiaumont, discernable and distinct battle damage such as trench lines and shell craters can be viewed while walking from the parking lot to the museum. In addition to the Ossuaire and adjacent military cemetery, the site contains a memorial chapel and a modern Visitor Center that interprets events at Verdun in 1916. A visit to the Ossuaire is both chilling and unforgettable.

Gettysburg Museum and Visitor Center, Gettysburg, Pennsylvania. The jewel of the U.S. National Park Service's several score military history sites, Gettysburg contains a newly opened (as of September 26, 2008) Gettysburg Museum of the Civil War, funded as a unique private-public partnership that interprets not only the 1863 battle but also places it in context within the Civil War. The Visitor Center is located on the periphery of the battlefield, and walking trails and driving routes of the 3-day engagement begin from the parking lot.

Waterloo Battlefield, Lion Mound Hamlet, south of Mont-Saint-Jean, Belgium. Although the battlefield is preserved by the nation of Belgium as a national treasure, attendant facilities are nearly all privately owned and operated. Interpretive facilities include the Waterloo Cyclorama, a Wax Museum, and a private Visitors Center. Battlefield landmarks such as La Haye Saint and Hougomont remain as privately owned working farms.

Isandhlwana and Rorke's Drift, Kwa-Zulu Natal, South Africa. A portion of the battlefield at Isandhlwana is preserved, and several small museums are available. Two local tourist concessions, the Fugitives Drift Lodge and Isandhlwana Lodge, provide meticulously researched guided tours of the two close battlefields.

Major U.S. Private Military Museums

Fort Ticonderoga. Fort Ticonderoga, originally restored by the prominent Pell and Thompson family of New York in the 20th century on the shores of

Lake Champlain, celebrated its centennial in 2009. This fort, a faithful reconstruction of the fortification originally constructed by New France in 1755, featured prominently in the Seven Years' War and American Revolution. It contains a well-regarded collection of 18th-century militaria and comprehensive research archives focused on 18th-century military treatises.

Pamplin Historical Park, Petersburg, Virginia. This park was established by the Pamplin family, a long-standing family with deep ties to Old Virginia. It contains a Civil War battlefield and Confederate fortifications, the scene of the initial breaching of the Confederate defenses of Petersburg by the Union Army of U.S. Grant in early April 1865. It contains a superb Visitor Center that complements the adjacent Petersburg National Military Park of the U.S. National Park Service, a number of original Civil War-era structures, and the recently opened National Museum of the Civil War Soldier, a state-of-the-art Civil War museum with modern multimedia capabilities dedicated to telling the Civil War soldier's story.

Conclusion

Military museums fill an integral role in military instruction and education and in the development of military organizations and institutions. There are thousands of military museums located throughout every nation, and one can nearly always be found in close proximity to any military installation. The availability of these military history focused resources constitutes a significant, and often untapped, potential for military training and knowledge.

MY LAI MASSACRE

My Lai remains one of the most problematic episodes in the history of the Vietnam War and in the entire course of U.S. military history. Without question, American troops committed war crimes by killing unarmed civilians in cold blood. What has been disputed is who should be responsible for these acts and the degree to which the events that took place in a small village in South Vietnam were commonplace or an aberration. The events of My Lai and the aftermath offer an excellent case study of both officers and enlisted personnel on when and why war crime can occur. It also highlights the moral courage of some who refused to obey an illegal order and bystanders who sought justice.

The Massacre

On the morning of March 16, 1968, a group of American soldiers—Charlie Company of the 11th Infantry Brigade of the Americal Division—attacked the village of My Lai in Quang Ngai Province of South Vietnam. They had hoped to surprise the Vietcong 48th Battalion, which had been operating in the area with impunity. Tensions ran high. The Tet Offensive, launched by the North Vietnamese and National Liberation Front, was now in its sixth week, and the soldiers of Charlie Company had been on patrol almost constantly. They had lost a number of soldiers to mines and booby traps during that period,

but they had been unable to engage their Vietcong enemy, which seemed to melt into the local peasant population just before U.S. troops arrived at a prospective battle site. The soldiers had come to resent the local population, which seemed sympathetic to the Vietcong, making the jobs of American troops infinitely more dangerous. The 11th Brigade was under the command of Colonel Oran K. Henderson, who answered to General Samuel Koster, head of the Americal Division.

Oran Henderson wanted the 48th Vietcong battalion eliminated, a task he handed over to Lieutenant Colonel Frank Barker, who assembled several companies into “Task Force Barker.” Captain Ernest Medina headed C Company, or Charlie Company. He was an excellent combat officer highly respected by his troops. Barker told Medina that on the morning of March 16, they would attack an area dubbed “Pinkville,” home to the 48th Vietcong. Because the villagers would be at the local market, the troops could assume that everyone left behind was Vietcong. On the evening of March 15, Medina assembled his three platoons—one of them under the command of Lieutenant William Calley—for a preoperation briefing. Medina described the mission and reminded the men that the attack would provide an opportunity to avenge their fallen comrades, killed by the 48th Battalion’s mines and booby traps. The anticipated engagement would be intense, bloody, and deadly.

When the helicopters arrived, however, they attracted no small arms fire. Over the course of the next 4 hours, U.S. troops summarily executed more than 500 Vietnamese men, women, and children. The soldiers also raped and mutilated women in the village before killing them. At the midpoint of the slaughter, the troops stopped for lunch and then resumed the bloodletting. Calley’s platoon did most of the killing, with Calley participating.

At one point, the chief warrant officer Hugh Thompson, hovering in a helicopter above My Lai, noticed Calley shooting a huddled group of Vietnamese. Outraged at what he believed was a war crime, Thompson landed the helicopter between Calley and the villagers and told the lieutenant that unless the killing stopped immediately, he would machine-gun the platoon. Calley told the platoon to stop firing, allowing Thompson to evacuate a group of villagers to safety. After Thompson returned to brigade headquarters, he reported the incident to a chaplain and to Oran Henderson,

expecting a thorough investigation required by army regulations. Charlie Company experienced only one casualty—a self-inflicted leg wound—and recovered only two weapons, evidence that they had not engaged the Vietcong but only a group of civilian noncombatants. The 48th was nowhere in sight. The after-action report, however, described an American combat victory at My Lai, and a news story about the “battle” made its way into *Stars and Stripes*. Oran Henderson did not conduct an investigation, and My Lai quickly drifted back into obscurity.

The Investigation and Public Scandal

More than a year later, multiple copies of a single letter began arriving at the White House, Congress, and the Pentagon, describing a horrific incident in 1968 at the village of My Lai in Quang Ngai Province. Ronald Ridenhour, a Vietnam veteran who had heard rumors of the massacre, wrote the letters,

in which he told how a unit of American soldiers had slaughtered hundreds of Vietnamese. Ridenhour learned about the events at My Lai through casual conversation with GIs who claimed to have witnessed and participated in the killing of civilians. Some said that they had not personally engaged in the killings, but several stressed that those who had were merely following orders. Medina, they claimed, had instructed Charlie Company to “waste” My Lai.

Even before the story broke in the national media, the U.S. Army assigned its own lawyers to investigate whether a war crime had occurred, and they asked Lieutenant General William R. Peers to head a formal investigation of the incident and any associated cover-up. In his report, Peers confirmed both—a massacre and then a cover-up at every level of the army chain of command. Before the criminal and official investigations were complete, however, Seymour Hersh, a freelance journalist, got wind of the massacre and

This photo of the My Lai Massacre by Ron Haeberle shows bodies of some of the victims lying along a road.

Source: Getty Images.

the cover-up and, on November 13, 1969, broke the story. The international wire services immediately picked it up, and My Lai garnered headlines in major newspapers around the world. On December 5, 1969, *Life* magazine published a set of grisly photographs of the massacre taken by Ron Haeberle, an official U.S. Army photographer assigned to Charlie Company. Critics on the left quickly cited My Lai as proof of a racist, genocidal campaign on the part of the United States to exterminate the Vietnamese people, while critics on the right treated the episode either as an anti-American fabrication or as an unfortunate, but noncriminal, consequence of war.

The lying and the cover-up had also distressed General William C. Westmoreland, former commander of the U.S. ground forces in Vietnam. He later wrote in his memoirs:

The developing evidence in the criminal investigation and in indications of command dereliction led . . . me, to arrange for an additional formal inquiry into the adequacy of the criminal investigation and possible suppression of information. When I learned that some members of President Nixon's administration wanted to whitewash any possible negligence within the chain of command, I threatened . . . to go personally to the president and object. That squelched any further pressure for whitewash. (Westmoreland, 1976, p. 375)

Charges were leveled at 16 officers and enlisted men. Early in 1971, Calley and Medina went on trial for murder at Fort Benning, Georgia. The international media covered the proceedings in detail. Calley insisted that he had followed orders given by Medina, who just as emphatically denied the allegation. On March 29, the military tribunal acquitted Medina of involuntary manslaughter. They convicted Calley of 22 counts of murder and sentenced him to life in prison at hard labor. Of the 14 officers facing court-martial for cover-up, only Oran Henderson, head of the 11th Brigade, actually went on trial, and he was acquitted. Many officers, however, faced other, noncriminal consequences. Major General Samuel Koster, commander of the Americal Division, lost a star and retired as a brigadier general. Brigadier General George Young, Koster's assistant at the Americal Division, received a formal censure, which effectively ended his career. Charges

against other officers and enlisted personnel were dropped.

The decision against Calley, however, triggered a firestorm of debate. Many conservatives felt a measure of sympathy for Calley, seeing him as a military scapegoat for the most unpopular war in U.S. history. President Richard Nixon, with his finger on the national political pulse, made a series of incremental moves to ensure that Calley avoided both prison walls and hard labor. Soon after the conviction, he ordered Calley released from the stockade and put under house arrest in an apartment at Fort Benning. In August 1971, the president reduced Calley's life sentence to 20 years and soon down to 10 years. In November 1974, Calley was paroled.

Legacies

Since then, in an effort to prevent such incidents in the future, the U.S. Army and historians have sought to identify the factors contributing to the catastrophe at My Lai. What had gone so wrong? Why had the United States gotten entangled in Vietnam? What had been our mission and how had it led to the massacre in My Lai? Decent Americans had participated in the war, but something had happened in Vietnam that allowed some of them to kill innocent civilians.

In his official report on My Lai, Peers came to several conclusions about the incident. The soldiers of Charlie Company had not been adequately trained on rules of engagement and war crimes—on how to identify criminal orders from superior officers and on their own individual responsibility to disobey such orders. At the brigade and division levels, commanding officers had been more concerned about their careers than their duty and had failed to investigate the incident and bring its perpetrators to justice. Many of the soldiers themselves, after months of stress and frustration, had developed ethnocentric feelings of resentment and superiority toward all Vietnamese—both combatants and civilians—that dehumanized them and increased the likelihood of improper behavior. In many ways, My Lai became a symbol for the entire Vietnam War.

The Peers Commission focused on deficiencies in U.S. Army training. All soldiers, airmen, marines, and sailors fighting in Vietnam were to receive training in the international laws of land warfare, the handling of noncombatants, and the

requirement to refuse to obey illegal orders from commanding officers. But in Vietnam, such training had been haphazard and casual at best, with the vast majority of soldiers remembering the charge to “obey orders or else,” and not the need to distinguish between illegal and legal orders and to report officers and noncommissioned officers for their illegal commands.

The Peers Commission and subsequent scholars have also focused on ethnicity and racism. Too many troops harbored convictions that the Vietnamese people were inferior to Americans. The widespread use by military personnel of epithets such as “gook,” “slant,” and “slope” as synonyms for Vietnamese revealed a streak of ethnocentrism, and military psychologists have long recognized that soldiers are more likely to mistreat those considered subhuman, especially when they also represent a clear and present danger.

The nature of the war then aggravated the racism. The conflict was fought overwhelmingly inside South Vietnam, making it extremely difficult for American soldiers to differentiate between enemy troops and noncombatants. The Vietcong had been recruited from South Vietnamese peasants, and many American soldiers, for obvious reasons, developed suspicions toward all Vietnamese, not just communists, and treated them accordingly.

The nature of combat operations in South Vietnam exacerbated the challenge of distinguishing between civilians and Vietcong. U.S. soldiers spent long days, weeks, and months engaged in search and destroy operations to locate an elusive enemy, with significant numbers of casualties as a result of land mines rather than head-on-head firefights with the enemy. The soldiers in Charlie Company witnessed death and serious wounds among comrades but enjoyed few opportunities to vent their pain and frustration against the enemy. American soldiers also grew resentful of Vietnamese villagers unwilling to identify the location of deadly land mines and booby traps. The My Lai region, known to Americans as “Pinkville,” had long been a notorious center of Vietcong activity, and it was no secret that the Vietcong often masqueraded as civilians. The army officers who planned the My Lai operation on May 16, 1968, had assured the combat troops that My Lai was infested with Vietcong, that civilians would be away at the local market, and that

an opportunity loomed to achieve a major military victory and to avenge the death of comrades.

Finally, the Peers Commission cited a failure of leadership on the ground that morning. Calley had been a poor officer, unable to read maps, and the butt of jokes from those under his command as well as from Medina, his commanding officer, who regularly ridiculed him in front of the troops. Both Calley and Medina had created a company culture deficient in discipline and unable to contain the blood lust that enveloped My Lai on March 16, 1968.

That day, the troops in My Lai found themselves battling a determined enemy where distinctions between friend and foe, soldier and civilian, blurred. Fighting for freedom degenerated into a quagmire of racism and violence, symbolized by My Lai. For critics on the left, the Vietnam War had betrayed Lyndon B. Johnson’s Great Society. While the president pledged to eliminate poverty and guarantee equality in the United States, his foreign policy had become a homicidal assault on Vietnam, a poverty-stricken, developing country. How could a nation committed to protecting freedom and democracy engage in such a holocaust? For Martin Luther King Jr., the plight of the brown-skinned Vietnamese during the war reflected the plight of African Americans and other minorities at home. In his speech “A Time to Break Silence,” delivered at Riverside Church in New York City on April 4, 1967, King denounced

this business of burning human beings with napalm, of filling our nation’s homes with orphans and widows, of injecting poisonous drugs of hate into the veins of peoples normally humane, of sending men home from dark and bloody battlefields physically handicapped and psychologically deranged, [which] cannot be reconciled with wisdom, justice, and love.

The war in Vietnam seemed to capture all that was wrong with America, at home and abroad.

For conservatives, My Lai and its critics similarly symbolized an America no longer moored to its heritage and history, “a country of sunshine patriots,” to use Thomas Paine’s wording, who held their soldiers in low esteem and stood ready to sacrifice them on an altar of liberal guilt and contempt. Perhaps Peers best captured the meaning of My Lai. On learning that President Nixon had paroled Calley,

a crestfallen Peers sighed, "To think that out of all those men, only one, Lieutenant William Calley, was brought to justice. And now, he's practically a hero. It's a tragedy."

James S. Olson

NATIONAL DEFENSE UNIVERSITY

The National Defense University (NDU) is a multifaceted Department of Defense institution. NDU is increasingly recognized as a focus for “whole of government” education, and it carries out three missions: primarily education, along with research and outreach. Located at Fort Lesley J. McNair in southwest Washington, D.C., with a second campus in Norfolk, Virginia, and a program in conjunction with Fort Bragg, North Carolina, the university began in 1976. Its faculty and staff intertwine civilians hired under Title X of the U.S. Code, agency personnel on loan for a fixed period of time, and active-duty or reserve military officers, offering a unique blend of understanding to teach current personnel about national security strategy here and abroad. Its role as a focal point for interagency and international discussions is shifting the dynamic of the university to that of an instrument of statecraft for the U.S. government’s soft power, or nonmilitarized, approach to the world.

Today, NDU’s components include five colleges, eight research centers and programs, a strategic gaming center, the National Defense University Press, reserve and senior military training courses, and outreach activities. NDU received accreditation in 1996 by the Middle States Commission on Higher Education to grant master’s degrees. NDU represents a crossroads for U.S. military officers, civilian governmental officials, and a small number of private sector employees with ties to the defense industrial base. The final component of the NDU

student body is a cadre of international officers from countries around the world to which the chairman of the Joint Chiefs of Staff, in consultation with the combatant commands, offered an invitation to send students to learn about the United States and share knowledge of his or her country for a year-long program in the United States. This entry examines the colleges, programs, and research centers of NDU.

Education: The Colleges

The Industrial College of the Armed Forces, known from its founding in 1924 until the end of World War II as the Army Industrial College, is a senior service college with a mission to educate its students on the role of “national strategic resource management,” including logistics and acquisition in national security strategy. In the autumn of 2012, it became the Dwight D. Eisenhower School for National Security and Resource Strategy but will continue educating officials from the Department of Defense, civilian agencies of the national security community, and foreign officers invited by the chairman of the Joint Chiefs of Staff to the college in national security concerns relating to understanding and enhancing the resource base that allows the United States to provide materiel for national security requirements. The Eisenhower School has two additional emphases differentiating it from the other senior service colleges of the professional military education system: teaching issues relating to acquisition along with incorporating students from the civilian defense industrial base into courses with civilians and military personnel in the senior Professional Military Education system.

These students may be from defense contractors, automobile makers, and other businesses that need to understand the resource process and its relationship to national security strategy. The Eisenhower School, like the National War College, offers its 315 annual students a 10-month accredited master's degree program that considers national security strategy, the resource challenges a conflict presents, and an "industry study," which gives students the opportunity to delve into a single subfield of the global economic base with much greater time and detail. The Eisenhower School has roughly a third of the international fellows at NDU with the remainder at the War College and College of International Security Affairs (CISA). These senior service schools allow students to earn Joint Professional Military Education Level II credit, as required under the Professional Officers Military Education Program.

The creation of the National War College resulted from lessons learned in World Wars I and II to include the profound need for greater understanding across and within the armed services as well as of the civilian agencies engaged in foreign policy decision making. The mission of the college, which has remained remarkably constant since opening its doors in 1946, is to educate the future leaders of the national security community for "high level policy, command, and staff responsibilities," with an emphasis on interagency and joint perspectives of national security strategy. The college educates roughly 220 students per year in its 10-month master's program in national security strategy. This program explores all aspects of developing, implementing, and evaluating national security strategy and allows the student to pursue a special emphasis in a "regional study," which is a single country or two countries in a region. The composition of the student body includes 60% U.S. officers, equally distributed between the sea services (U.S. Navy, Coast Guard, and Marine Corps), army, and air force—at the lieutenant colonel/colonel and navy equivalent rank—along with roughly three dozen international officers. The remaining students are from the civilian portions of the national security community. The State Department from its founding has had a major role in the college because its officers were part of the original conception of the community that needed to be part of the increased conversation across the government and services. The author of the "containment" policy

(1947–1989) against the Soviet Union, Ambassador George F. Kennan, wrote his article on the subject while serving as the inaugural international affairs advisor at the college.

The Joint Forces Staff College (JFSC) began in 1946 as the Armed Forces Staff College, but the adoption of its current title in the early 21st century reflects the emphasis in the U.S. military on its jointness rather than simply combined operations. Located in Norfolk, Virginia, JFSC is a midlevel (educating officers at the 12-year point in their careers, on average) joint educational institution. According to the JFSC website, its mission is to educate "national security professionals to plan and execute operational-level joint, multinational, and interagency operations to instill a primary commitment" involved with today's warfighting issues. JFSC has several programs, such as the Joint Advanced Warfighting School, the Joint and Combined Warfighting School, and the Homeland Security Planners' Course. The JFSC student, in general, works toward Joint Professional Military Education Level I certification, although higher level programs are also at Norfolk.

In the 1980s, emerging concerns about information as both a potential threat and a tool of statecraft led to the 1988 creation of the Information Resources Management College (IRMC or "iCollege") to assess the utilization of information technology as an instrument of national power. The iCollege offers far more short courses than any of the other components at NDU, ranging from a couple of days to several weeks' duration. The courses focus on the wide array of national security concerns relating to information, and the college offers a number of certificate programs in information issues. The iCollege has become a focal point for U.S. government education on considering the information aspects of national power through process reengineering, management of acquisition processes, information technology, and transformation. Its programs fall under three departments: (1) Information Operations and Assurance, (2) Chief Information Officer, and (3) Systems Acquisition.

The fifth school, the CISA, began in 1997 as the Defense Leadership and Management Program during the Clinton administration to educate Department of Defense civilians about national security more effectively than the military traditionally has done. In the next decade, the program also

included national security executive education but gradually took on its current focus on “interagency, interservice and international” approaches to international security when it adopted its current name. Areas of emphasis include counterterrorism, counterinsurgency, and strategic planning. CISA graduates earn a master of arts in strategic security studies. A significant constituency is the Counterterrorism Fellows program for the Department of Defense, which brings students—civilian and uniformed, domestic and international—to study for 10 months. CISA’s offerings include the Counter-Terrorism Education Capacity-Building Program, the Homeland Defense Fellowship Program, the master’s degree in strategic security studies, and a number of nondegree programs for government and military officials in the United States.

NDU also has had a number of nondegree programs targeting both military education at the national security level and the interface of civil-military understanding in national security strategy. These include the Capstone course for newly minted general officers and ambassadors, Pinnacle for three-star officers confronting joint and combined campaign planning and operation, the Center for Joint Strategic Logistics to emphasize the overall lessons for the nation to consider for best practices in this area, the Keystone program for the senior enlisted personnel, and courses in Joint Reserve Affairs preparing both military and civilian leaders for immediate positions or offering refresher training on the changing context in the national security community, with NDU serving as an ideal focal point for these activities.

Research

One of the fastest growth areas for NDU over the past decade has been the proliferation of research centers and programs. All research falls under the vice president for research and active learning. The oldest research body at NDU is the Institute for National Strategic Studies (INSS), currently functioning as an umbrella organization for studies requested by the Joint Staff and other Pentagon offices. INSS researchers also generate their own agenda. INSS publishes short research pieces on timely issues and occasionally also publishes more extended works.

The INSS umbrella covers several smaller, targeted centers engaged in policy-relevant study of

issues directly applicable to national security in today’s world. The Center for Applied Strategic Learning is a gaming center that offers a venue for various portions of the U.S. government to test ideas, engage in new approaches to strategic challenges, and open doors for cooperation across the national security community. The Center for Technology and National Security Policy evaluates new technologies as assisting or threatening current approaches to international policy. The Center for Complex Operations distills lessons from U.S. security experiences abroad as a “lessons learned” repository while also asking what the challenges are in an evolving, complex security environment. The Conflict Records Research Center makes documents captured from recent enemies of the United States available for study by scholars of warfare and related fields. Current holdings come from al Qaeda, the Saddam Hussein government in Iraq, and operations in Afghanistan. The Center for the Study of Weapons of Mass Destruction has been considering this challenge for a decade. The Center for Strategic Research does direct work for the Department of Defense in seven areas crucial to national security: the Western Hemisphere, Asia Pacific, Europe and Eurasia, Energy and the Environment, Near East and South Asia, Future Strategic Concepts, and Africa. The Center for the Study of Chinese Military Affairs was a congressionally mandated facility for translation of Chinese military documents but has largely operated as a facility to do research on the People’s Liberation Army.

NDU also has the Strategic Conference Directorate, hosting conferences many times per year at NDU and in conjunction with institutions around the world.

Outreach

One of the three primary missions for the university, increasingly through 2012, was outreach to the broader U.S. national security community, civilian and governmental, as well as with similar institutions and military components around the globe. A reorganization by the Joint Staff, putting the university directly under the J-7 head, however, has resulted in a new mission statement that puts much more emphasis on teaching over both research and outreach. It would appear that many of the outreach enterprises resulting from bilateral relationships

that NDU has had with institutions and countries, with NDU being a party to memoranda of agreement with many similar national defense academic institutions outside of the United States, might be much less important in the future. This would also decrease stress on NDU serving as an instrument of national policy by opening venues for dialogue with academic, government, and military groups across the spectrum.

NDU had several institutions to carry out its outreach, ranging from the International Student Management Office to the Center for Joint and Strategic Logistics to the Institute for National Security Ethics and Leadership.

Cynthia A. Watson

NATIONAL GUARD, ARMY

The federal mission of the Army National Guard (ARNG), according to its website, is “to maintain well-trained, well-equipped units available for prompt mobilization during war and provide assistance during national emergencies.” As of May 2010, the ARNG did this with 363,003 members.

ARNG units are under the direct authority of their state governors, but they may be activated for federal service under Title 10 of the U.S. Code. Title 10 “allows the President to ‘federalize’ National Guard forces by ordering them to active duty in their reserve component status or by calling them into Federal service in their militia status.” This entry examines the mission, history, structure, and operations of the ARNG.

Force Structure

The 2006 Quadrennial Defense Review (QDR06) Report recommended reforms in order to more effectively conduct the war on terrorism and to conduct “irregular warfare activities, including long-duration unconventional warfare, counterterrorism, counterinsurgency, and military support for stabilization and reconstruction efforts.” The army responded with its modular force conversion, designed to provide “a more flexible, more capable, and more rapidly deployable force.”

Modular force conversion required the army to convert from “a division-based force to a more flexible brigade-centric force.” ARNG brigade combat teams (BCTs) “are structured and manned identically to those in the active Army” to facilitate integration. The ARNG structure projection for 2013 consisted of 8 divisions, 34 BCTs (10 Heavy BCTs, 23 Infantry BCTs, and 1 Stryker BCT), 7 fire brigades, 10 combat support brigades (Maneuver Enhancement), 9 sustainment brigades, 2 battlefield surveillance brigades, 8 divisional combat aviation brigades, 4 theater aviation brigades, 1 theater aviation group, and 31 functional brigades.

Current Overseas Deployment

As of April 2006, more than 39,000 Guardsmen were serving in Operation Iraqi Freedom (139,733 to date), 14,000 in Operation Enduring Freedom (37,700 to date), and 652 in Operation Noble Eagle.

Since the September 11, 2001, attacks, more than 248,000 soldiers have been mobilized under U.S. Code Title 10 authority and more than 337,000 under Title 10 or Title 32.

History

The National Guard originated in the colonial militias. Citizen soldiers organized into militia units to defend their local communities. They were determined to preserve their independence from central authority and, after national independence and the adoption of the Constitution, were seen as a counterbalance to the power of the federal government.

State militias served in every major U.S. war. Their early performance was problematic for several reasons. Historically, state militias and National Guard units have faced three sets of recurring problems: (1) command and control issues, (2) recruiting and retention issues, and (3) training and equipment issues. In every instance of their use, questions have arisen as to who actually commands the Guard. The practice of the men electing their company officers often turned command into a popularity contest. State governors and state adjutants general were in command of their respective Guards and technically remain so to this day, but when National Guard troops are federalized under U.S. Code Title 10, they are placed under the direct command of the Regular Army. The Army Reserve is different from the National Guard in this respect because it is exclusively under the command of the federal government.

Recruiting and retaining individual soldiers was also a problem. Irregular pay led to high attrition rates. In addition, state militias were not given top priority in the allocation of state funds. Consequently, many citizen soldiers drilled without pay, provided their own uniforms, and were inclined to view their organizations as social clubs rather than professional military organizations.

Training for the National Guard was often conducted at a local level. Units relied on experienced members to guide them through drill and ceremony, weapons training, and the like. It was not until the 20th century that the Regular Army began to standardize training and require Guardsmen, and later Guardswomen, to submit to Basic Training and Advanced Individual Training at Regular Army bases. It would not be until the late 20th century

that the Department of Defense provided state-of-the-art weaponry to the ARNG.

The performance reviews that followed the Spanish-American War convinced the federal government that it must ensure a minimum performance standard for the militias. U.S. policymakers passed the Militia Act of 1903, often referred to as the Dick Act after its sponsor—the former Guardsman and U.S. senator from Ohio, Charles Dick—to address this need.

The federal government would provide pay, transport, uniforms, weapons, necessary equipment, and the administrative costs associated with their disbursement, for National Guard units during field training if the Guard conformed to certain standards, including holding 24 drills per year and a minimum 5-day field training exercise. The National Defense Acts of 1916 and 1920 brought federal pay for drills as well as annual training.

Federal money came with strings attached. The federal government demanded greater input into decisions that the states traditionally had made regarding Guard issues. State autonomy was significantly reduced, and the tension that had always existed between the active army and the militia continued unabated. These reforms greatly improved Guard performance in the wars of the 20th century. National Guard units contributed significantly to the victories in World Wars I and II.

After World War II, a national effort was made to recruit Guard members that netted 81,648 enlistments. Part of the campaign was the promise that the Guard would maintain a 1-year lag behind standard equipment of the active military. In 1950, Congress passed the National Defense Facilities Act with funds earmarked to construct new armories and maintain buildings for the ARNG. Washington provided 75% of the cost while the state or local community picked up the other 25%.

Guard units were federalized for service in the Korean War. Selected units were also federalized during the Berlin Crisis of 1961. The call-up of the Reserves in 1961 was a fiasco for the army. Significant problems were identified in a summary prepared for the chief of staff of the army in December 1961. Secretary of Defense Robert McNamara began to develop the Total Force Concept (TFC) shortly thereafter.

As things in Germany wound down, U.S. policymakers strengthened their commitment to the Republic of Vietnam. Congress passed the 1964

Tonkin Gulf Resolution that allowed President Lyndon Johnson to introduce combat troops in March 1965. Johnson committed 560,000 U.S. soldiers to Vietnam between March 1965 and March 1968. Johnson's escalation was accomplished without calling up reserve forces in significant numbers. The war had been sold to the public as a limited war that would be over quickly, and one that "Asian boys" should fight. Activating the reserves would counter that message.

The draft and lottery policies from 1965 to 1973 led some young men to enlist in the ARNG to escape the war. Duty in the Guard meant virtually no chance of duty in Vietnam. As a consequence, authorized numbers for the National Guard were reduced so that the Selective Service could meet the needs of the army in Vietnam. Several Guard units were activated during the war but mostly for duty in the United States. Eight different units sent 2,729 men to Vietnam.

One of the most controversial events in ARNG history occurred in 1970 during a confrontation between an Ohio National Guard unit and antiwar protestors. The deaths of four Kent State University students caused a review of the Department of Defense regulations regarding the use of deadly force.

The withdrawal of U.S. forces from Vietnam following the 1973 Paris Peace Treaty led to declining enlistments in the ARNG. To counter this trend, the National Guard offered tuition assistance to personnel attending institutions of higher education in 1973. The National Guard Bureau also issued directives to encourage recruitment and retention of minorities and women.

The TFC gained momentum in the wake of Vietnam. As the result of pressures to downsize the military, and with the advent of the all-volunteer force, the Department of Defense relied more heavily on the Guard and the Reserve. Secretary of Defense Melvin Laird called for the implementation of the TFC in August 1970, but his successor, James Schlesinger, converted the TFC to a real program. Schlesinger issued a directive on August 22, 1973, that required the armed forces to integrate active and reserve forces. Formal ARNG readiness reports were required in October 1973, and in 1975, Guard commanders were involved in the army's first post-Vietnam mobilization exercise. A new army affiliation program was begun that assigned ARNG divisions to active divisions for training support.

Another important component of the TFC was to provide the Guard modern equipment. It made no sense to train Guard personnel on modern equipment at active-duty bases and then have them return home to antiquated equipment. This policy also helped with recruiting because it undermined the perception of an inferiorly equipped Guard.

General Creighton Abrams, who replaced General William Westmoreland as commander, Military Assistance Command-Vietnam in 1968, and became army chief of staff in 1972, believed that the failure to mobilize reserve forces during the Vietnam War was one of the principal reasons the American public never got behind that war. General Norman Schwarzkopf agreed. When tasked with meeting the threat Saddam Hussein's invasion of Kuwait posed to U.S. national interests in 1990, Schwarzkopf requested the federalization of the National Guard for service in Operation Desert Shield and later in Operation Desert Storm. On August 25, 1990, the Pentagon announced the activation of 174 FORSCOM Reserve Component units from 38 states and Puerto Rico.

Rather than call a partial mobilization of up to 1 million reservists for a period of 2 years, the president relied on Section 673b, Title 10, U.S. Code that allowed for the mobilization of 200,000 reserve personnel for 90 days and, subject to renewal, for a second 90 days. Although this seems transparent, there were behind-the-scenes politics taking place. At issue were the limitations Congress had placed on the executive branch's ability to commit troops without oversight. Although the War Powers Act of 1973 and Section 673b really did not reduce presidential power, they did not sit well with American presidents.

The ARNG played an instrumental role in the Persian Gulf War victory, but not without difficulties. Vehicles had to be painted for desert camouflage, equipment had to be packed for shipping, and there were always administrative details. Weapons qualification was a daily event, as was physical training, and training with Mission, Oriented, Protective, Posture Gear. There were shortages of desert uniforms, desert boots, and ammunition for M-16s and crew-served weapons until early November 1990.

More than 25% of all activated units departed the continental United States within 20 days of activation and two thirds deployed in 45 days or less. Fully 94% of the soldiers called to duty were fit for

overseas service. Most of the rejected soldiers had simply not completed Advanced Individual Training.

President George H. W. Bush issued Executive Order 12733 that authorized reserve units to be used in combat operations. Ninety-nine ARNG units were federalized in November 1990. Of the 101 activated Guard units in support roles outside the combat zone, 16 were sent to duty at North Atlantic Treaty Organization (NATO) bases. The other 85 remained in the United States. A total of 62,411 Guard personnel in 398 units served on active duty between August 8, 1990, and the end of the war.

The most important news for the ARNG in the post-Gulf War environment was its downsizing from 457,000 soldiers in 1991 to just 338,000 soldiers by 1995. George H. W. Bush called for reductions the same day Saddam Hussein ordered his armed forces to invade Kuwait. George H. W. Bush was under pressure to provide a “peace dividend” as Soviet power declined. He responded in August 1990 with the “Base Force” concept. Base Force was predicated on the assumption that the post-Cold War environment required a reduced military. General Colin Powell, chief of the Joint Chiefs of Staff, spearheaded Base Force to streamline the armed forces yet still meet America’s overseas responsibilities.

According to historian Michael Doubler, Powell perceived four primary military missions for the military: meeting NATO commitments, keeping peace in the Pacific, maintaining a U.S.-based rapid response force, and maintaining nuclear deterrence. National Guard leadership identified four primary Guard missions under Base Force: (1) to remain the nation’s primary reserve force, (2) to “maintain combat forces in the first line of defense,” (3) to remain the nation’s principal responder to domestic disasters, and (4) to participate in domestic operations that developed the “social and moral fabric of the nation.”

George H. W. Bush called for up to a 25% across-the-board cut for the military. Active-duty forces would be reduced to 1.6 million from 2.1 million. This translated into a drawdown from the post-Vietnam high of 18 regular and 10 guard divisions that had been organized into 5 corps to a Base Force of no more than 20 divisions organized into 4 corps. ARNG would be allocated 8, not 10, divisions. Before the end of 1990, with the United States gathering ARNG forces in Saudi Arabia, the secretary of the army informed the ARNG that it should prepare for cuts that might eliminate 137,000 personnel.

The transition from the Bush administration to President Bill Clinton’s made it clear that Clinton would embrace the Bush policy of military cutbacks. Clinton appointed Les Aspin, former chairman of the House Armed Services Committee, as his secretary of defense and retained General Colin Powell as chairman of the Joint Chiefs of Staff. Clinton ordered a reassessment of U.S. military posture in a post-Soviet environment in September 1993 known as the Bottom-Up Review, or BUR. The Bottom-Up Review envisioned an additional 160,000 personnel cut from the armed forces. On September 1, 1993, Aspin announced that the ARNG would field 15 brigades, but they would be equivalent to only five divisions.

Reducing the National Guard was difficult because its lobbying body, the National Guard Association, was a potent force on Capitol Hill. There was also the fact that nearly every congressional delegation found a reason why its Guard units should be spared at the expense of other states’ units. The drawdown took 4 years.

An additional consequence of Base Force and the Bottom-Up Review was that many of the deactivated army units transferred their equipment to the Guard. Such transfers enhanced the Guard’s mission to provide quick and effective support to the active army.

Despite the reductions, the ARNG was called on to participate in the War on Drugs. Congress appropriated \$300 million for waging the drug war in 1989. Of this amount, \$40 million was for the National Guard. The ARNG was also called on to fulfill U.S. NATO obligations and to conduct traditional state duties.

General John M. Shalikashvili succeeded Powell as chairman of the Joint Chiefs of Staff. Shalikashvili and two secretaries of defense, Les Aspin and William Cohen, believed that noncombat interactions with other countries would promote both stability and the image of the United States as a peacekeeper. Because the U.S. military already had similar programs, the new policy was a matter of emphasis. By 1996, 21 state National Guards had entered relationships with the militaries of several former communist bloc countries in addition to existing relations with Latin American militaries.

President Clinton inherited the commitment of peacekeeping forces in the Sinai Desert along the Egyptian-Israeli border. Clinton also ordered Operation Uphold Democracy in the summer of

1994, and U.S. forces occupied Haiti, disarmed the Haitian military, and returned President Jean Baptiste Aristide to office. ARNG soldiers participated in both operations.

Clinton also employed the ARNG when President Slobodan Milosovic launched attacks in 1991 against states seeking to secede from Yugoslavia. By 1993, an estimated 150,000 people had been killed in what was called "ethnic cleansing." The United States contributed 20,000 of a total NATO force of 60,000 personnel in 1996. As of July 23, 2003, there were 1,800 U.S. personnel serving under the NATO-led Stabilization Force, nearly half of them ARNG.

The training the ARNG received prepared it for many contingencies, but few members were trained to anticipate the kind of attack that struck the United States on September 11, 2001. In fact, few Americans from any walk of life could have imagined terrorists using civilian aircraft as missiles to attack civilian targets on the day that Vice President Dick Cheney declared "changed everything." It was difficult to identify an enemy that specialized in unconventional tactics and was not concerned with rules of conduct and engagement.

The definition of what it means to be a member of the Guard evolved after President George W. Bush indicated that the Global War on Terrorism might last for decades. In an era where the Pentagon increasingly relies on the Guard and reserve to accomplish its missions, part-time soldiers have become full-time soldiers more frequently, and for more extended periods, than ever before in American history. Barring passage of a draft, it is likely that the all-volunteer army will remain dependent on the Guard to fill out force needs for the foreseeable future.

Operation Enduring Freedom, the official name of the War in Afghanistan, had lasted nearly 11 years as of July 2012. Operation Iraqi Freedom, the official name of the war in Iraq, ended in 2011 after 8 years. ARNG units have been the backbone of these operations, especially in terms of combat service support and combat support roles. All of the historic issues the activation of the ARNG raises have occurred in these two wars, but a new problem emerged with multiple tours of duty. Many ARNG units have served two, and even three, tours of duty in Iraq and Afghanistan. Recruiting and retention have been difficult, so much so that the army implemented a little used policy that allows it to retain personnel who perform vital duties

beyond their original estimated time of separation. The service of female soldiers has also expanded dramatically as a result of the Persian Gulf War and the Iraq War.

For the men and women of the ARNG, of the many things that became clear in the days and months that followed 9/11, the meaning of the recruiting phrase "one weekend a month" had changed dramatically to reflect the more prominent role for members of the National Guard.

NATIONAL MILITARY FAMILY ASSOCIATION

The National Military Family Association (NMFA) is a nonprofit (501[c][3]) special interest group representing military families. The group's mission is "to fight for benefits and programs that strengthen and protect uniformed services families and reflect the nation's respect for their service," according to the group's official mission statement. It operates programs for military children and spouses, provides information and support for military families,

especially around deployment issues, and lobbies the U.S. Congress on behalf of military family members for benefits and support services. The NMFA works on behalf of the families of all branches of the uniformed services, whether active duty, reserve, or National Guard. In addition, families of the U.S. Public Health Service and the National Oceanic and Atmospheric Administration are part of the NMFA. This entry examines the history, structure, and programs of the NMFA.

The group was founded in 1969 by several wives and widows of military service members to address the plight of military widows who were left without support when their husbands died. The Military Wives Association, as it was first known, lobbied for the Uniformed Services Survivor Benefit Plan, which was created in 1972. The Uniformed Services Survivor Benefit Plan is an insurance plan that provides an annuity for the survivors of a deceased military retiree. Enrollment in the program is automatic on retirement, and a retiree cannot opt out of the program without the written consent of the beneficiary. A retiree can name a spouse, children, former spouse, or other "insurable interest" such as another family member or business partner as a beneficiary.

The group continued to push for improved benefits for family members. Successes in the 1980s and 1990s ranged from increases in the authorized weight of household goods for moves; the authorization of travel funds for college-going children of military personnel stationed overseas; the defeat of a bill that would have prevented military spouses from working as teachers in the Department of Defense school system; to increased family housing allowances to comprehensive changes such as the Military Child Care Act and the TRICARE health care program for personnel, family members, and retirees.

Most of the programs and legislation advocated by the NMFA are supported by active-duty personnel and retirees, but at times the interests of military families and military personnel diverge. In 1980, for example, the association came out in favor of the Uniformed Services Former Spouses Protection Act, a measure that provided for equitable division of retirement benefits between military personnel and their former spouses in case of divorce. Interest groups representing active-duty personnel and retirees fought fiercely against the Uniformed

Services Former Spouses Protection Act, although it did pass in 1982. The Survivor Benefit Plan itself was not without controversy among service members and retirees, who pay for premiums under the plan. Although active-duty personnel are members of the NMFA's board of directors, the organization is focused on issues of interest to military families, whether or not these coincide with the interests of active-duty personnel or the military institution itself.

Since 2001, when the nation's armed forces were mobilized in Afghanistan and, later, Iraq, the NMFA has been extremely active in supporting active-duty and reserve families facing the deployment of their family members. The group has successfully advocated for an increase in Family Separation Allowance from \$100 per month to \$250 per month, fought for increased benefits to survivors of military personnel killed in the line of duty, worked with the Army Wounded Warrior Program to support families of injured personnel, and helped push for improvements in the Family Medical Leave Act. The NMFA is a founding member of the Military Coalition, an umbrella group of associations of active-duty personnel, retirees, spouses and families, and others who support legislation benefiting the armed forces. The association has also conducted a number of large-scale surveys of military family life, collecting a large amount of valuable information on the challenges and benefits of military life.

Currently, the NMFA runs three programs for military families, all of them initiated in 2004. The Joanne Holbrook Patton Military Spouse Scholarship program provides funding for spouses seeking education, from GED (General Educational Development) certification to postsecondary studies. The Military Family Awards honor military families who are active in service to their communities. The largest program, Operation Purple, sends children of deployed service members to summer camp and organizes retreats for personnel and families. The association also maintains an active presence on the Internet, providing information and guidance on the welter of benefits and programs designed for military spouses and children.

The group's headquarters are located in Alexandria, Virginia. It employs a chief executive and as of 2008 includes a paid staff of 47. The board of directors consists of 25 military spouses,

retirees, and active-duty personnel. More than 200 people volunteer with the organization. It receives about \$10 million in contributions each year through membership dues and donations. In 2008, about \$6.7 million was spent on youth programs, mostly the Operation Purple camp and retreat program, and most of the rest was spent on community outreach, education, and advocacy. Approximately 91% of the group's expenditures go toward its programming, while 3% goes to fund-raising and 6% to administration costs, making the NMFA one of the most highly efficient charitable organizations according to charity watchdog groups such as the Better Business Bureau and Charity Navigator.

NATIONAL SECURITY ACT

The National Security Act was a sweeping piece of legislation that restructured the U.S. military, created several new government agencies, and sought to promote greater coordination between civilian and military leaders in the formulation of U.S. foreign and national security policy. It established both the National Security Council (NSC) and the Central Intelligence Agency (CIA), elevated the air force to coequal status with the army and navy, and provided for the unification of the three military services within a single National Military Establishment (NME; later to become the Department of Defense). It was signed into law by President Harry Truman on July 26, 1947, and the former navy secretary James V. Forrestal was sworn in as the country's first secretary of defense on September 17. The following sections briefly

outline several of the major provisions and effects of the National Security Act.

The National Security Council

The NSC was established to serve as an advisory body to the president on matters relating to national security and foreign policy. The council's chief responsibility was to promote coordination and cooperation between key civilian and military policymakers. In its original form, the NSC included seven permanent members: The president; the secretaries of state, defense, army, navy, and air force; and the director of the National Security Resources Board (NSRB). Under the terms of the National Security Act, other cabinet- or subcabinet-level officials could be added to the NSC at the president's discretion.

The Central Intelligence Agency

The onset of the Cold War convinced many policymakers that it would be necessary for the United States to maintain a national intelligence-gathering organization in peacetime. The National Security Act established the CIA to fill this role and charged it with the collection, evaluation, and dissemination of information relating to matters of national security. The CIA was to be responsible for keeping both the president and the NSC apprised of developments anywhere in the world that might affect the security of the nation. The CIA was not assigned to an existing cabinet department but rather was organized as an independent agency reporting directly to the NSC. In September 1947, Rear Admiral Roscoe Hillenkoetter was sworn in as the agency's first director.

Military Unification

Agreement on the form that the NME would take was achieved only after several years of often-contentious negotiations between the War and Navy Departments. The Second World War had convinced both services of the necessity of establishing a formal mechanism for interservice coordination to replace the ad hoc Joint Chiefs of Staff system utilized during the war. They disagreed, however, on how this coordination should be achieved. The War Department advocated the establishment of a unified Department of National Defense, under the leadership of a strong civilian secretary. The War Department proposal called for the appointment of a uniformed chief of the general staff who

would advise the secretary of defense on technical matters, particularly budget allocations. The Navy Department's proposal was based on a report drafted for Forrestal by his close associate Ferdinand Eberstadt. The Eberstadt Report recommended the retention of separate War and Navy Departments, the establishment of a third cabinet department to oversee the air force, and the creation of an NSC to oversee coordination between the armed services and civilian policymakers.

Under pressure from Truman to resolve their differences after more than a year of stalemated negotiations, Secretary of War Robert Patterson and Navy Secretary Forrestal brokered a compromise in January 1947. The agreement, codified in the National Security Act, called for an NME in which the U.S. Army and Navy Departments, along with a newly created Department of the Air Force, reported to a civilian secretary of defense. Within the NME, however, the three services retained a considerable degree of autonomy. The authority of the secretary of defense over the individual services was initially quite limited, and in effect, the Departments of the Army, Navy, and Air Force retained "quasi-cabinet" status, with all three service secretaries being granted permanent seats on the NSC.

The National Security Resources Board

The NSRB was a short-lived agency established by the National Security Act to oversee economic mobilization in the event of war. The NSRB was tasked with such duties as long-range planning for industrial mobilization, identifying potential shortages of vital strategic materials, and reducing waste and delays in war production. The Greyhound Corporation's president Arthur Hill was appointed in 1947 as the first director of the NSRB. The NSRB was formally disbanded in 1953.

Amendments

The National Security Act has undergone a number of amendments. In 1949, at the recommendation of outgoing secretary James Forrestal, the authority of the secretary of defense over the individual armed services was greatly strengthened by the provision of additional staff support, most notably an undersecretary of defense. In the same year, the membership of the NSC was reshuffled, with the U.S. vice president being named a permanent member of the coun-

cil and the three service secretaries losing permanent member status. The 1949 reforms also redesignated the NME as a single cabinet-level Department of Defense and stripped the three service departments of their quasi-cabinet status. In 1986, the Goldwater-Nichols Department of Defense Reorganization Act designated the chairman of the Joint Chiefs of Staff as the "principal military advisor" to the president and the NSC, a role that had previously been shared by all the Joint Chiefs.

NATIONAL SECURITY AGENCY

The National Security Agency (NSA) was established on November 4, 1952, by means of a classified memorandum from President Harry Truman to the secretaries of defense and state. Created to address clear flaws in the ability of the U.S. government to collect and analyze communications intelligence, today the NSA is the cryptologic organization for the United States. Its responsibility is to protect U.S. national security information systems domestically; abroad, those responsibilities include collecting and disseminating foreign signals intelligence by means of cryptanalysis, cryptography, mathematics, computer science, and foreign language analysis.

Strategic Mission of the NSA

The NSA's strategic mission is twofold. The first of these is to use "signals"—communications, be they verbal, electronic, or written—from foreign organizations, persons, or states to collect intelligence on those organizations, persons, or states and to produce counterintelligence. Second, the mission is to provide varying means of protection, including services, products, solutions, and defensive information operations to ensure the security of U.S. information and intelligence. This protection is referred to as "information assurance."

Since its inception, the NSA has been under the purview of the Department of Defense; as such, it is staffed by both military and civilian employees. It is also a part of the U.S. intelligence community (IC). The NSA's headquarters is located at Fort George G. Meade in Maryland. The budget for the NSA and the number of its employees are classified. The NSA is headed by the director of the NSA, who is an officer in the U.S. armed services. This director answers to both the secretary of state and the director of national intelligence.

The end of the Cold War posed challenges to the NSA and the IC as a whole. The fall of the Soviet Union eliminated the greatest threat to the United States, and as a result, the future of the intelligence community seemed in doubt. However, the effectiveness of intelligence officers during the Persian Gulf War—particularly with regard to actionable intelligence that allowed American and allied troops to quickly and efficiently dispatch Saddam Hussein's Republican Guard—mitigated that doubt.

To this day, the NSA remains among the most secretive members of the IC, earning it the monikers "No Such Agency" and "Never Say Anything." Indeed, for many years, its existence was not formally acknowledged by the U.S. government.

NSA in a New Era

Since September 11, 2001, the secretive NSA has found itself in the press with increasing frequency, most notoriously for a year-long mission to tap into phone calls, web activity, and text messages of those believed to be external threats to the United States. These activities extended to cases where the target was communicating with someone inside the United States; often the NSA carried this surveillance out without acquiring search warrants. Under the Foreign

Intelligence Surveillance Act of 1987, the NSA is required to obtain a warrant from a three-judge panel in order to spy on American citizens. In the case of the warrantless wiretapping, however, the NSA was directed to act by President George W. Bush, who used the recently passed USA PATRIOT Act to bypass the Foreign Intelligence Surveillance Act Court.

While the NSA's official mission is clearly stated, its actions go far beyond protecting American secrets. The NSA conducts top-secret work in numerous areas, most notably nuclear, naval, ground, and air satellite operations; counterdrug, counter-improvised explosive device, and psychological operations; weapons technology; training, security, personnel, management and administration, information technology, and facilities; and technical intelligence, intelligence analysis, cyber operations, and counterintelligence. Because of the highly sensitive nature of these programs, more detail on the exact scope of these activities is currently unavailable; even the existence of these programs under NSA purview remained classified information until recently.

Though the post-9/11 creation of the Office of the Director of National Intelligence was meant to streamline information sharing among the members of the IC, clear divisions still remain between the NSA and other intelligence organizations, such as the Central Intelligence Agency. Though both agencies are dedicated to protecting the United States, their spycraft is markedly different and, as such, leads to competition for resources and the ear of the President.

NATIONAL SECURITY COUNCIL

Under the terms of the National Security Act of 1947, the National Security Council (NSC) was intended to

advise the President with respect to the integration of domestic, foreign, and military policies relating to the national security so as to enable the military services and the other departments and agencies of the Government to cooperate more effectively in matters involving the national security.

Under the original statute, the members of the NSC included the president, secretary of state, secretary of defense, and the service secretaries of army, navy, and the newly established air force, and the president could designate other officials to attend meetings of this body. The 1949 National Security Act Amendments cut the mandated size of the board with only the president, vice president, secretary of state, and secretary of defense required by the legislation to serve on the council. The 1949 Act removed the service secretaries from the council and designated the chairman of the Joint Chiefs of Staff and director of the Central Intelligence Agency (CIA) as advisors to the board. Each president has expanded the size of the NSC to include a range of officials and even close aides, such as the White House chief of staff.

Beginning with President Harry S. Truman, the role of the board in formulating policy in areas of war and peace has shifted. Although an afterthought in the legislation that established the NSC, the role of the National Security Advisor has achieved heightened importance, particularly in recent administrations, and has come to overshadow the role of the NSC as a collective group. Under the National Security Act of 1949, the NSC was explicitly designated as part of the Executive Office of the President. The staff of the NSC has increased significantly, currently numbering 240 personnel in the administration of President Barack Obama.

Congress had hoped that a formal NSC structure would help enable a relatively inexperienced Truman to make complex decisions. One powerful advocate of the NSC, Navy Secretary James Forrestal, viewed it, with its statutory Cabinet-level members, as a mechanism to help box in the newly created Defense

Department—specifically, the secretary of defense—thereby retaining some of the U.S. Navy’s traditional autonomy.

Truman did not care for the NSC, resenting the implication that he needed help. After the first NSC meeting, he did not attend another until the Korean War broke out in June 1950, leaving the chairmanship of the NSC to his secretary of state. From the Korean War on, Truman called frequent NSC meetings and personally chaired 62 of the 71 subsequent meetings between June 1950 and January 1953. The Truman-era NSC had but a handful of staffers with no substantive functions in policy. By and large, the Department of State assumed the lead in policy making during the Truman years.

President Dwight D. Eisenhower’s NSC staff expanded in size. Eisenhower also created the position of Special Assistant for National Security Affairs. The NSC advisor became the principal administrative agent of NSC. The role was pioneered by Robert Cutler, a banker with service in the War Department during World War II. Cutler set agendas and assisted in policy, planning, and policy coordination. Cutler’s NSC staff grew to more than 70 professionals.

Full NSC meetings, comprising all the statutory cabinet level members, were held weekly, with Eisenhower presiding over them. Eisenhower’s management style reflected his military background and his concern with the costs of funding the policy of “containment.” Therefore, the secretary of the treasury and the budget director frequently attended NSC meetings, along with the chairman of the Joint Chiefs of Staff and the director of the CIA. CIA operations became increasingly important as they seemed to Eisenhower a more economic means of dealing with Soviet power. Eisenhower only missed 6 of 179 NSC meetings. Over the course of the Eisenhower years, the full NSC was forced to come to grips with an increasing number of issues.

Secretary of State John Foster Dulles and CIA director Allen Dulles were Eisenhower’s chief foreign policy advisors, responsible for foreign policy implementation. But in the last year of the Eisenhower administration, NSC meetings appeared somewhat formulaic. Perhaps the lack of policy innovation was due to the president’s occasional serious health problems, and the illness of Secretary of State Dulles, who was diagnosed with cancer in 1956 but stayed in office until shortly before his death in 1959.

President John F. Kennedy reduced the NSC staff to 48, down from 71 in the last years of Eisenhower's presidency. But while the NSC staff was downsized, the president gradually augmented the role of his national security adviser, McGeorge Bundy. At first, Bundy deferred to Secretary of State Dean Rusk, whom Kennedy designated as the lead officer in all overseas matters. But early in his presidency, Kennedy sensed that the Department of State had become unresponsive and rigid. In contrast, Bundy's small NSC staff could produce sharply focused decision papers in short order. Bundy's punchy national security action memoranda underscored the president's penchant for timely "action."

The president's informal decision making allowed for creative solutions, distinct from the regular bureaucracy. At the time of the Cuban missile crisis, Kennedy assembled an ad hoc group of advisors, the so-called ExComm, a group drawn from within and without government and known as "The Wise Men." The ExComm helped produce options and perhaps slowed the pace of the confrontation with the Soviet Union. The crisis was resolved when the president decided to come to a private understanding with Chairman Khrushchev, using his brother Robert Kennedy as an intermediary. The decision was at odds with the advice of nearly all the members of the ExComm, with the exception of the secretary of state.

On the death of President Kennedy, President Lyndon B. Johnson had no choice but to rely on Kennedy's NSC personnel and process. In time, however, Johnson relied more heavily on Secretary Rusk and the Secretary of Defense Robert McNamara. McNamara and Rusk became Johnson's chief foreign policy advisors. As the Vietnam War escalated, Bundy and the NSC were marginalized, a process abetted by a 1966 directive that strengthened the authority of the State Department. The NSC seldom met formally under Johnson, who preferred more informal meeting with advisors.

When Walt W. Rostow replaced Bundy at the NSC in 1966, Rostow found he had the ability to affect policy. During the Johnson years, the interdepartmental coordinating role of the State Department produced little beyond consensual verities and the routinization of Cold War policies.

The NSC of President Richard M. Nixon was larger and designed to provide clear options.

Nixon was highly suspicious of the established intergovernmental consensus and the bureaucrats that managed foreign affairs. Nixon's assistant for national security affairs, Henry Kissinger, chaired NSC interdepartmental groups, thereby limiting the influence of the Department of State. Kissinger also chaired contingency planning groups, policy intelligence groups, crisis groups, and even a defense review group.

Only in matters that involved the Department of Defense was Kissinger's influence equaled and, for the most part, checked by Defense Secretary Melvin Laird. But Kissinger's dominance of the NSC process was far ranging, and included becoming the principal negotiator in high-level matters of every kind, frequently without the knowledge of the secretary of state. In the Nixon-Kissinger era, Kissinger's dominance derived from his unique position and authority. When Kissinger became both the head of the NSC and the secretary of state in September 1973, there was little gainsaying his virtual monopolization of foreign policy initiative and design.

In November 1975, President Gerald R. Ford named Air Force Lieutenant General Brent Scowcroft as national security adviser, replacing Kissinger. Because Scowcroft had been Kissinger's NSC deputy, his appointment did little to diminish Kissinger's preeminence. However, Scowcroft was adept at including more meaningful input from the permanent foreign affairs bureaucracy.

President Jimmy E. Carter had decried the power of the NSC staff under Kissinger during his campaign and initially attempted to end NSC dominance, pledging to make the State Department and the NSC advisor "coequal" and "collegial" in foreign affairs. The Carter-era NSC was led by Dr. Zbigniew Brzezinski. Soon an animus developed between the NSC advisor and his staff, on the one hand, and the Department of State and Secretary of State Cyrus Vance, on the other. The State Department found itself marginalized in such critical issues as Soviet-American relations, China, and Iran.

In 1979, Secretary Vance was not informed about the (ill-fated) plan to rescue U.S. diplomats held hostage by the Iranian government. Vance did not learn of the rescue mission until the NSC-designed raid was under way. The secretary of state felt he had little choice but to resign. However, bureaucratic warfare between the NSC staff continued unabated

under the new secretary of state, the former senator Edmund Muskie.

Early in the presidency of Ronald W. Reagan, a presidential directive affirmed the role of the State Department as the lead agency in foreign policy. The NSC advisor would no longer chair interdepartmental groups. The role was given back to the State Department. The new secretary of state, Al Haig, termed himself the new foreign policy “vicar,” apparently hoping to dominate the foreign policy process by decree. But Haig failed to command the bureaucracy as he had hoped and came to despair that the policy process had become a “black hole” into which his policies seemed to disappear.

Secretary of State George Shultz succeeded Haig in July 1982. As in the Carter years, policy seesawed between the Defense Department and the State Department. From the start, the new secretary of state vied with Secretary of Defense Casper Weinberger for control and direction of foreign policy.

The first NSC advisor, Richard Allen, reported through the presidential counselor for domestic affairs. Judge William Clark soon replaced Allen. After 9 months, Clark took the job of interior secretary, and Robert McFarlane became national security adviser. McFarlane was soon depleted by the job, and his deputy, Vice Admiral John Poindexter, became NSC advisor in January 1986.

The NSC’s role was, for the most part, marginal until the mid-1980s. But both Admiral Poindexter and Robert McFarlane were deeply involved in an illegal and secret effort to arm revolutionaries in Nicaragua and sustain them through proceeds of arms sales to Iran. These undertakings were contrary to American law and stated official positions. The scandal broke at the end of 1986.

Poindexter resigned, and Ambassador Frank Carlucci replaced him in December 1986. Soon, Carlucci became Secretary of Defense, to be replaced by Army General Colin Powell in November 1987. With six advisors in 7 years, the Reagan-era “NSC system” staggered to a fitful close.

However, in the home stretch of the Reagan presidency, Secretary of State George Schultz achieved unchallenged foreign policy coherence. The long rivalry with the defense secretary ended with Weinberger’s resignation in 1987 and the president’s quest to find a *modus vivendi* with the Soviets proceeded to the point where most of the issues of the Cold War appeared to be on the cusp of resolution.

In contrast to President Reagan, President George H. W. Bush came to office with significant foreign policy experience. Bush had been director of the CIA, U.S. ambassador to the United Nations, and U.S. representative in China. Highly confident of his expertise, Bush exercised great personal control aided by James Baker, the secretary of state and a longtime advisor, and Scowcroft, the national security adviser. Bush was also close to Richard Cheney, the secretary of defense, and Robert Gates, director of the CIA. Baker and Scowcroft were exceptionally close to the president and oversaw an organized and focused policy-making system.

President Bill Clinton’s NSC, in contrast, was innovative. Clinton added new players to the NSC process: the secretary of treasury, Lloyd Bentsen, and the U.S. ambassador to the United Nations. Additionally, a new National Economic Council, headed by the assistant to the president for economic policy, Robert Rubin, paralleled the NSC in seeking to coordinate the decision-making process in domestic affairs. Some National Economic Council staffers also served as NSC officials. Also, an important role for the vice president was signaled by the detailing of one of his close aides to the NSC.

Clinton’s first-term NSC advisor, Anthony Lake, tried to limit the impact of domestic politics on White House foreign policy making. Lake said he desired to play “honest broker,” modeling himself on Scowcroft. But Lake’s efforts fell apart because Secretary of State Warren Christopher, a lawyer for most of his career, found his “client” (the president) to be hesitant and indecisive. Christopher long waited for initiative and guidance from the White House. Though Lake had not wanted to be “operational,” the vacuum left by the secretary of state led Lake to take a more activist role than he expected. When Serbian forces began a series of murderous attacks on the breakaway regions and peoples of the former Yugoslavia, the need for White House policy direction became acute.

While Europeans, the United Nations, and the U.S. State Department dithered, tens of thousands died in Bosnia and Croatia. In mid-1995, the NSC advisor finally took the reins of policy, and Lake was detailed to inform North Atlantic Treaty Organization partners of a new presidential resolve to end the Bosnian conflict. In mid-1995, a U.S. air campaign to bring the Serbs to the bargaining table began in earnest.

The secretary of state was nowhere to be seen in this process. An indefatigable undersecretary of state, Richard Holbrooke, headed the vigorous diplomatic effort to settle the Balkan wars. The negotiation over the shape of a Balkan peace was conducted by Holbrooke, largely on his own, far from Washington in a Dayton, Ohio, airplane hangar in September 1995.

In Clinton's second term, Sandy Berger ran a more disciplined and larger NSC apparatus, exerting extensive control over foreign affairs agencies and executive departments. A new secretary of state, Madeleine Albright, was publicly and privately more assertive, but she forged a good working relationship with Berger. After the Clinton administration, Berger and Albright joined in creating a private consulting firm. Significantly, there was not a single formal meeting of the NSC during Clinton's second term.

Clinton had successes in securing landmark trade accords with the ratification of North American Free Trade Agreement and with China's becoming a member of the WTO (a trade agreement with China accompanied by Clinton's successful push to allow China to join the World Trade Organization). Still, Clinton turned to foreign policy issues only sporadically. In two instances, the former president Jimmy Carter took an unbidden lead, as crises seemed to come to a head without an effective executive response. President Carter managed to secure an unopposed American military presence in Haiti and to defuse a potential showdown over North Korea's atomic ambitions. Some critical White House initiatives—with North Korea and Iran, and a settlement of the Palestinian issue—came too late to germinate and flower.

In February 2001, President George W. Bush issued a National Security Presidential Directive indicating that the NSC was to "coordinate executive departments and agencies in the effective development and implementation" of foreign policy. The Bush team assembled a huge NSC staff of some 241 professionals. Although Bush and National Security Advisor Condoleezza Rice were personally close, the State Department was all but excluded from policy, and Rice was consistently outflanked by Vice President Cheney and Defense Secretary Donald Rumsfeld.

In the second Bush term, Rice was named secretary of state. Bush's troop "surge" stabilized an

impending foreign policy fiasco in Iraq. Bush and Rice also secured more than \$60 billion from Congress for State Department-led health and development initiatives in Africa. Significant resources were brought to bear against the AIDS epidemic and had a positive impact on the lives of tens of millions. The long depletion of resources for the Department of State and the United States Agency for International Development was reversed, and the State Department became more effective during the last years of Bush's tenure.

President Barack H. Obama designated marine general James L. Jones (Ret.) as national security advisor. Jones asserted that the NSC would be "dramatically different" from that of prior administrations. But White House political advisors disliked and ignored Jones. In turn, Jones derisively termed some senior White House political aids "water bugs." Soon, Secretary of State Hilary Clinton and the Secretary of Defense Robert Gates routinely bypassed Jones, taking their positions directly to the president.

In October 2012, Jones's senior deputy, Thomas Donilon, a close associate of Vice President Joe Biden, became the new NSC advisor. Donilon was close to Obama, and grew closer. Unlike Jones, Donilon worked famously long hours, chairing some 270 deputies meetings in less than 3 years. He claimed, with evidence, that there were now no "back doors to the president." Obama was said to be disciplined, on top of his brief, and demanding. The NSC process again reverted to the model of the Scowcroft years.

Conclusion

Whether the national security adviser should be confirmed by the Senate and be subject to more congressional oversight is a recurrent and still open question. The advice and consent of the Senate would ensure more transparency and accountability in policy but would risk making the NSC just another bureaucracy and force the president to go outside a "mandated system." Making the NSC advisor's nomination subject to Senate confirmation would probably result in a president conjuring his own ad hoc NSC staff and shaping his own foreign policy process.

The NSC process works best when the president is fully engaged. As Scowcroft recalled, "the National

Security Adviser can't do it [without the president]. He's junior to all the other people. He needs that moral authority." In the end, the NSC system, the NSC advisor, and the NSC staff are resources that can be used, abused, ignored, or exploited, as the president chooses. The challenge of taming a huge bureaucracy and ensuring its interests are congruent with presidential policy, and national interest is a work in progress.

NATION-BUILDING

While *nation-building* is a concept widely used by academics, journalists, and decision makers, it lacks a precise definition. In a 2008 report produced by the Organisation for Economic Co-operation and Development, nation-building is defined as “the process of building a sense of a common national identity, whether defined in an ethnic, cultural or political sense.” An oft-cited study maintains that nation-building “involves the use of armed force as part of a broader effort to promote political and economic reforms with the objective of transforming a society emerging from conflict into one at peace with itself and its neighbors” (Dobbins, Jones, Crane, & DeGrasse, 2007, p. xvii). These two definitions see nation-building as a social process, but the first considers it as driven by domestic actors and the second by foreign ones.

Adding to the concept's unclear meaning, the growth of humanitarian interventions since the end of the Cold War has led many people in policy and academic circles to equate *nation-building* to *state-building* or *peace-building*—a term developed by the United Nations during the 1990s that encompasses the multiple efforts external actors execute to establish a self-sustaining peace in war-torn societies. Indeed, as a term, nation-building is mostly used by American policymakers. To define nation-building, it is important to differentiate between internally driven nation-building efforts and those imposed by external actors. Once these differences are established, it is necessary to describe some of the goals that inform contemporary nation-building missions and provide two reasons why many of these have failed to fulfill these goals. This entry describes the

process of nation-building and modern nation-building missions.

An Internally Driven Process

While the nation-state's ideological roots can be traced back to the Treaty of Westphalia of 1648, the principle was universalized in 1945 with the signing of the UN Charter. Since then, the number of nation-states has more than tripled, increasing from 51 to 192. As the main unit of political organization, the nation-state has four elements: "(a) permanent population; (b) defined territory; (c) government; and (d) a capacity to enter into other relations with other states" (Montevideo Convention, 1933). This conceptualization assumes congruence between the state as a juridical-political entity and the nation as sociocultural entity. Given that the world has more nations than states and that not all nations are included within a single country's territorial borders, the state has been forced to construct a sense of nationhood among its citizens over time.

The Organisation for Economic Co-operation and Development's definition of nation-building, cited above, sees it as a domestic process driven by the state's institutions. This is closely associated with the development of nationalism in Europe in the aftermath of the French Revolution. The goal of this social process is not only to legitimate the state's authority but also to create a social consensus that endorses the state's political and socioeconomic interests. Over the years, states have built national identities by establishing public schools, standardizing school curricula, encouraging a single language, creating national symbols (flags, anthems, etc.), celebrating national holidays, and supporting the work of certain cultural groups. States have also used their coercive capacities to enforce and to protect their conception of social order.

Nation-building exercises can foster intergroup conflicts. This is especially the case when a state constructs the nation's identity along essentialist lines (race, language, ethnicity, religion, etc.). Fearing that the state's conceptualization of the nation will inhibit their members' participation in their society's political or economic life and threaten their cultural heritage, marginalized groups struggle against the state in hopes of establishing a more inclusive national identity. Many historical examples demonstrate that resistance to these nation-building exercises tends to

be nonviolent at first, but if a government ignores these opposition movements' demands or if it tries to suppress these protests, these groups will develop more violent strategies and force them to secede and establish their own nation-states.

States have also legitimated their rule through democratic mechanisms. Thus, nation-building exercises do not have to be based on narrow, essentialist criteria. Civic conceptions of nationalism have taken shape in many democracies, where the national identity is based on a citizens' affinity to a set of political values. Thus, states that pursue nation-building strategies along essentialist lines are more prone to experience severe legitimacy crises that cripple the state's ability to administer society or enforce the rule of law. Since the end of the Cold War, these states have been described as "failed" or "weak" states.

A Process Enforced by Outside Actors

With the end of the Cold War, the UN secretary general Boutros Boutros Ghali reoriented the work of his organization's organs and specialized agencies to promote democracy, advance human rights, and encourage market economics. The UN efforts have been in line with the U.S. neoliberal values and its commitment to globalization. In the past two decades, the international community has been involved in the reform of nation-states' political and economic structures in hopes that these changes will increase the number of democracies, deepen global economic interdependence, and encourage interstate cooperation. To accomplish these goals, the United Nations and other donor organizations alongside Western states have stressed the importance of building up the state's institutional capacity.

Not all countries have been able to transform their societies according to these principles. These failed or weak states have become a source of anxiety for the international community. These states are more likely to descend into civil wars, leading to widespread human rights abuses, humanitarian crises, and acute refugee flows. As experienced in Central Africa, instabilities in these failed or weak states can easily spread to neighboring states, sparking further regional instability. Especially worrying since the terrorist attacks of September 11, 2001, many of these states are seen as magnets for terrorists, drug dealers, and other criminal organizations.

The second definition of nation-building, cited above, more closely approximates this global interest in developing state capacity. In this manner, the emphasis is for outside actors to intervene militarily in a civil war, settle the fighting, and establish a new social order along neoliberal lines. In other words, the goal of this intervention is to reconstruct the state's coercive and administrative capacities. While outside interveners work with local actors in this project, outsiders play a leading role in the short term. Their troops provide security, while their civilian administrators initiate state-building strategies.

It is important to note that building the state's capacities has been seen as more critical than constructing new national identities based on civic values. The growing influence of neoliberal values plays down the salience of identity-based issues. According to this perspective, individuals' relation to an established social order is motivated by utilitarian interests rather than a need to be part of an identity-based, collective grouping. This view does not ignore identity-based concerns altogether. The belief is that if the state can meet its citizens' basic needs, provide security, enforce the rule of law, and promote human rights, former combatants will be free to associate in the public sphere to construct new political cultures based on common interests. Rather than engineering new national identities, supporters of this definition of nation-building contend that these interactions will produce new civic-based identities that will legitimate the social order, closely resembling civic conceptions of nationalism discussed above.

Making Sense of Post-Cold War Nation-Building Missions

As a concept, nation-building has been widely used in American policy circles. Other countries and intergovernmental organizations tend to use other terms, such as *state-building* or *peace-building*. During the Cold War, the United States conducted several nation-building missions (e.g., Japan, Germany, South Korea, South Vietnam, and Panama). Since the end of the Cold War, the United Nations, with the support of its most powerful member states, including the United States, has either authorized many of these missions or its peacekeepers and civilian administrators have led them.

Contemporary nation-building missions are complex and involve many actors. While the intervention force's military plays a dominant role at first, transnational civilian administrators are those responsible for the transformation of the war-torn society's political, economic, and social structures. These missions attempt to fulfill four key goals.

The first goal is the stabilization of postwar environments and the institutionalization of a new security regime. This is probably the most critical goal, as the lack of security makes it difficult for transnational administrators to accomplish the other three objectives. In the short term, foreign troops need to protect local inhabitants, disarm combatants, and thwart disgruntled leaders from organizing militias or insurgencies. Over the long term, foreign forces, with the support of civilian administrators, need to rebuild the country's security apparatus. Training and equipping these new military, police, and intelligence units are costly and protracted efforts.

The second goal is the institution of a transnational civilian administration that can deliver humanitarian aid, manage the economy, and deliver basic public services. If a peace agreement has been signed by former combatants, this body oversees its implementation. In many cases, these administrators work closely with local leaders to rebuild the state's bureaucracy, design new constitutional structures, carry out democratic reforms, and establish a new representative government that can take over the country's affairs and continue these reforms once outside interveners end their mission.

The third goal is economic reconstruction along capitalist principles. Most war-torn societies face severe economic challenges: Their infrastructure is in shambles; their states lack the capacity to collect taxes, regulate economic activity, or manage monetary supply; their high unemployment rates are a source of anger; and their financial and banking systems are too weak to promote investment. Transnational civilian administrations not only have to address these challenges, but they must also convince international donors to finance reconstruction efforts, while attracting foreign direct investments. More critically, these administrators need to work closely with international financial institutions to renegotiate the country's sovereign debt and provide new loans to sustain reconstruction efforts.

The final goal is the creation of a new collective identity based on civic values. Because most contemporary nation-building missions have been executed in societies divided by ethnic, racial, or sectarian conflicts, administrators have realized that their political and economic reforms can only survive if individuals of these diverse groupings are willing to work together to establish new cultures based on tolerance and trust. Consequently, these nation-building exercises, originally conceived of as state-building enterprises, are expanded to address the roots of these identity-based conflicts. In some cases, administrators, with the assistance of non-governmental organizations and intergovernmental bodies, set up truth and reconciliation commissions or conflict resolution programs to increase dialogue among everyday citizens or leaders of these social groups.

Given their complexity, it is not surprising that many contemporary nation-building missions have not successfully met these goals. In some cases, these missions have failed to address the root causes of the conflict, seeing these societies descend once again into civil war. In other cases, external actors have not invested the necessary resources or earned enough local support to secure the transformation of these countries' political, economic, and social structures. It is not surprising that many academics and policymakers have questioned the effectiveness and the desirability of these missions.

While each nation-building mission is unique, there are at least two main reasons why many of these contemporary missions have failed. The first is the fact that outside interveners do not have the will to carry through these efforts over the long term. Nation-building cannot be accomplished on the cheap; it requires a heavy investment in financial resources and military and civilian personnel. Resolving the conflict and transforming the social order according to neoliberal values require a long-term commitment, which many outside actors are unwilling to make. The second reason is similar to the first. For nation-building to succeed, outside actors need to establish a strong partnership with local actors. In other words, rather than enforcing a set of security, political, and economic reforms, civilian administrators need to find ways of empowering local leaders so they can devise the necessary strategies to stabilize their country, rebuild their

state's capacity, and build new inclusive, civic-based identities that promote tolerance and trust.

NATIVE AMERICANS

The story of Native American military service is lengthy and complex. Scholars have been divided about the merits of studying this topic, since the relationship of Native peoples to the U.S. federal government in general, and the American armed forces in particular, is not always a proud one. Yet Native peoples have fought for, as well as against, the United States since the days of the colonial Indian wars. Public fascination with this service has grown in recent years, with the celebration of the World War II-era Navajo code talkers. This entry examines that process of interaction and conflict and offers some thoughts on the motives and contributions that Native societies have made to America's fighting forces.

Statistics

Native Americans often have been represented in the ranks of the American military in numbers greater than their share of the general population. As of September 2008, there were 24,173 Native Americans in uniform, constituting 1.7% of the total 1,409,210 active-duty forces. Native American women constitute 2.1% (4,300) of the total 202,842 female active-duty personnel. According to the 2010 U.S. Census, 5.2 million people have been identified as American Indian and Alaska Native, either alone or in combination with other races. In addition to active-duty forces, there are approximately 190,000 Indian veterans throughout the nation.

The Warrior Tradition

The history of American colonization, with its Indian wars and massacres, often made American soldiers the enemy of Native people. Yet Native alliances with American forces also occurred. During the War of 1812, Chief Junaluska and other Cherokee men fought along with General Andrew Jackson at the Battle of Horseshoe Bend. Once the Civil War started, Native American tribes fought for both sides. Indian soldiers, such as Colonel Ely Parker (Seneca), served with General Ulysses S. Grant, while Stand Watie became a Confederate brigadier general. Warriors from the Crow Nation of Montana allied with Lieutenant Colonel George Armstrong Custer, and Crow scouts died with his command at the Battle of the Little Big Horn. Theodore Roosevelt recruited Native Americans, who saw action in Cuba during the Spanish-American War of 1898.

There are various reasons for Native service in the military. Some are unique to Native history, and some are universal to all cultures. Economic need, access to educational and job training, patriotism, and a sense of duty are some of the reasons that Indians and non-Indians alike enlist in the military. Unemployment rates for Native Americans on poverty-stricken reservations can reach as high as 80%, and economic stability can be an extremely difficult task. Moreover, rural reservations rarely offer the same education or training to be found in urban communities. As with many non-Indians, tribal members left home to seek access to college and professional training.

While Native Americans entered the military for these shared reasons, there are some reasons unique

to their situations. First, protection of their ancestral land and culture, family, and community has been the most important purpose of serving in the armed forces for many Native Americans. Their sincere love for the land, no matter who controlled it, be it the United States or indigenous nations, encouraged Indian people to fight for the country. Protection of their homeland, moreover, helped preserve their way of living, values, and culture. They did not necessarily wish to protect the nation called the United States but their ancestral land and their people that became part of the United States.

Second, some Native Americans consider military service important for their maturity, as it instills a sense of purpose, accomplishment, and pride. Before and after their enlistments, Native Americans participate in ceremonies in their communities where they are honored for their decision. The Native tradition of honoring warriors for their valor and patriotism continues even today, and Indian tribes demonstrate their appreciation for Indian soldiers' service in various ways. For example, powwows offer opportunities to recognize Native American soldiers and veterans for their sacrifice to the country and its people.

World War I and the First "Code Talkers"

The best known example of the Native contribution to the U.S. military is that of the code talkers. Most attention is paid to the Navajos who served in the Marine unit in the Pacific theater of World War II, where their language (essentially unwritten), which the Japanese military could not decode, became the source of communications among American forces.

As early as World War I, American leaders encouraged Indians to enlist in the military as a part of integrated units, instead of segregated ones, to further the cause of Americanization. Some Native Americans, however, served in all-Indian units, including Company E of the 142nd Infantry of the Texas-Oklahoma National Guard. Among the 600 Native soldiers in this unit were the Choctaw code talkers. During the war, 19 Choctaw soldiers used their tribal language as a code. The first reported use of these code talkers was on October 17, 1918. The Army Signal Corps also utilized Indians from the Hopi, Ojibwa, Oneida, and Sac and Fox tribes. These code talkers helped the United States defeat

Germany by transmitting crucial communications through the use of their own tribal language.

In spite of their significant service in the war, the U.S. government did not recognize the code talkers' contributions. The first government to honor the Choctaw code talkers was not the United States, which had sent them to fight Germany. Instead, it was the government of France, which in 1919 recognized their contribution in the war by awarding four members of the 142nd Infantry with the *Croix de Guerre*, recognizing their acts of bravery.

The Native American soldiers' contribution during the Great War proved their preparedness for American citizenship. In part for that reason, the U.S. government in 1919 granted full citizenship to Indian veterans (41 Stat. 350). Five years later, Congress passed the Indian Citizenship Act of 1924 (43 Stat. 253). This provided that all Native Americans received a certificate of citizenship if they did not possess one. Because of service to the United States, all Native Americans became U.S. citizens.

World War II

During the Second World War, 24,521 reservation Indians and approximately 20,000 off-reservation Indians served in the European and Pacific theaters of war. The number represented more than 10% of the total Native American population of 350,000. Among them were about 400 code talkers. In the U.S. Army, approximately 50 Native Americans worked in the special Native language communication in Europe. The Marine Corps, on the other hand, assigned more than 300 Navajos for communication duty in the Pacific region. The idea to use the Navajo language as a code was introduced by Lieutenant Philip Johnston, a non-Native missionary's son who had lived on the Navajo reservation.

In spite of their devoted service during World War II, the contribution of the code talkers, or even their existence, was little known for over 20 years after the end of war. The Navajo code talkers had been sworn to silence, and their role had been kept secret until 1968 when the Department of Defense declassified the code. Thus, the Navajo code talkers were recognized by the U.S. government in 2001, when they were presented with congressional medals. Code talkers from other tribes had to wait seven more years until the passage of the Code Talkers Recognition Act (122 Stat. 4774). The purpose of the act was to recognize all Native code talkers for

their dedication and valor, and they were awarded the Congressional Gold Medal.

One of the well-known Native American soldiers serving during World War II was Major General Clarence L. Tinker (Osage). He was the first Native American to become a major general in the U.S. Army. He also became the first U.S. general officer to die in combat in the war, on June 7, 1942, during the Japanese attack on Midway Island. In his honor, Tinker Air Force Base outside Oklahoma City was named after him.

Cold War Era: Korea and Vietnam

Little information exists in terms of the Native Americans in Korean War, but it is estimated that between 10,000 and 12,000 Native American soldiers served in the war. Charles George (Eastern Band of Cherokee), Raymond Harvey (Chickasaw), and Mitchell Red Cloud Jr. (Ho-Chunk) received the Medal of Honor for their service in this warfare.

More than 42,000 Native Americans (about 90% of them volunteers) served in the conflict in Vietnam. The image of Native Americans as warriors who are used to guerrilla fighting—the type of warfare that their ancestors utilized against the European and American intruders—also influenced command decisions to send Native soldiers to the front.

Posttraumatic Stress Disorder and Recovery

As did many of their fellow service members, Native American veterans of all wars faced difficult times readjusting to life back home. One such Indian veteran was Ira Hamilton Hayes, a Pima from Arizona, who served as a paratrooper in the Marine Corps. On February 23, 1945, Hayes and five other soldiers raised the Stars and Stripes at the top of Mount Suribachi on the Pacific Island of Iwo Jima. Through a famous photograph, Hayes and his comrades became heroes of the war effort. On Veterans Day in 1954, the U.S. military held a ceremony to dedicate the Marine Corps War Memorial, a 78-foot statue of the flag-raising that includes bronze figures 32 feet high, in Arlington National Cemetery. Three months after the dedication of the statue, Hayes was found dead in a roadside ditch near his reservation home. He had succumbed to alcoholism and exposure.

The life of Ira Hayes exemplifies the challenge of readjustment among Native American veterans, many of whom suffered from what came to be

known after Vietnam as posttraumatic stress disorder. According to one study, Vietnam-era Native American veterans were twice as likely to suffer from posttraumatic stress disorder as their White counterparts. Scholars have shown that the high percentage of Native American soldiers in the Vietnam War contributed to the overall high rate of serious mental disorders in soldiers after the war.

While such studies have shown that minority soldiers had more chance to see combat and suffered from posttraumatic stress disorder, Native American soldiers confronted another problem: They fought an enemy who resembled themselves. The American soldiers also referred to enemy-controlled territory as "Indian Country," a reference to the Western movies of the 1940s and 1950s where this phrase was used often. For many Native soldiers, the enemy was indigenous people fighting for their self-determination, much like themselves. They observed parallels in the U.S. government's attitude and treatment of people in Vietnam, Iraq, and some other nations.

Contemporary Warriors: From the Persian Gulf War to the Iraq War

In the 1980s and 1990s, Native American soldiers saw duty in Grenada, Panama, Somalia, and the Persian Gulf. During the Persian Gulf War, more than 3,000 Native men and women served in the Persian Gulf. Manuel Michael Davila, a 24-year-old Lakota man, became the last soldier to be killed in combat in the war. At the time when Operation Enduring Freedom started, 18,000 Native Americans served in the military, while an undetermined number were deployed to Afghanistan.

In the conflict of the early 2000s in Iraq, the death of a Native American woman soldier drew national attention. Private First Class Lori Ann Piestewa, a Hopi from Arizona and single mother of two young children, was deployed in February 2003 as a member of the 507th Army Maintenance Company. When her support-service unit was ambushed in Nasiriyula in southern Iraq on March 23, 2003, Piestewa became the first servicewoman to die in the Iraq War and the first Native American woman to die in combat while serving the U.S. military. As was the case of many Native American veterans, she came from a family with a military tradition: Her father had served in Vietnam, and her grandfather in World War II. Squaw Peak in Phoenix was renamed Piestewa Peak after her.

Conclusion

In spite of the historically complex relationship with the United States, Native Americans have served in the nation's armed forces in impressive numbers. Their economic needs, as well as limited educational and job opportunities, encouraged Indian youth to join the military. Their wish to protect their homeland provides strong motivation for Native American soldiers. The Native Americans' enduring tradition of joining the U.S. military continues today, a reminder as to why Native people chose to serve a country that did not always respect their sacrifice.

NATURAL DISASTER, MILITARY RESPONSE TO

Beginning in the 1950s with the advent of civil defense, the U.S. military establishment has been tasked to support civilian authorities during disasters. Originally codified in the Federal Civil Defense Act of 1950, the Department of Defense has, over all the intervening years, worked to set aside capabilities and

forces to support civilian authorities. Today, these capabilities are available to support the response to and recovery from natural disasters, special security events such as political conventions or the Super Bowl, and accidental or human-made disasters, particularly in support of presidential emergency declarations. This entry discusses the capabilities and the role of the U.S. military in responding to natural disasters.

At the center of these defense capabilities is the National Guard. The Guard is uniquely positioned to respond to disasters because of its triad of tasking authorities. The governor of a state can activate and financially support Guard activities in the state. Under Title 32, the governor can activate the Guard and request the federal government to pay for its operations. Under Title 10, the Guard responds to and is funded by and directed by the president and the legal national military authority. This flexibility makes the Guard the centerpiece of military support for civilian authorities.

With the passage of the Ronald W. Reagan National Defense Authorization Act for Fiscal Year 2005, Title 32 was amended to allow Guard forces to be used for "homeland security activities." Most recently, Department of Defense Directive 3025.18, of December 2010, incorporated other directives and outlined clear criteria for using military forces in support of civilian authorities. All requests from civil authorities and qualifying entities for assistance should be evaluated for the following:

1. *Legality*: Would the use of military forces comply with the law?
2. *Lethality*: Would lethal force be part of the mission of the military forces?
3. *Risk*: Would the forces be unnecessarily put in harm's way?
4. *Cost*: Who pays?
5. *Appropriateness*: Is the use of military forces in the interest of the Department of Defense and its missions?
6. *Readiness*: Will this commitment affect readiness in other mission areas?

In recent history, the use of military forces in support of civil authority during disasters has been greeted with mixed reviews. Perhaps the most significant and visible deployment of military forces was during Hurricanes Katrina and Rita in 2005. Some authors were of the view that the deployment of

guard units to Afghanistan and Iraq seriously undermined the readiness of those forces that remained home in Mississippi, Louisiana, and Texas. However, these conjectures do not fit the facts as events unfolded in these Gulf states. Almost immediately after the storm began to abate, literally hundreds of guard and reserve helicopter units self-deployed to the region and began rescue operations. Other uniformed units were on the scene to assist in the recovery of bodies, rescues of those stranded, and in securing property. The flexibility and adaptability of the units along with their inherent command and control allowed military support to be most effective. Eventually, the Coast Guard, National Guard, and active-duty military forces facilitated the restoration of order to the region.

More recently, the flooding along the Missouri River was supported by guard units operating under state control. These units, operating on their home turf, provided immediate stability to the impending crisis and allowed civil authorities to deal with the human aspects of this tragic displacement of people and destruction of private property. As of the fall of 2012, National Guard units were still supporting Hurricane Katrina operations.

Not all interactions between the military and civil authorities work as well as was seen in the Midwest during the summer of 2011. Often, as was the case in certain circumstances in Katrina and Rita, integrating military capabilities into civil structures can be problematic. Civilian authorities are unwilling to cede sovereignty and local control to any entity outside the jurisdiction. The adage that all disasters are local is usually in full force. Even if the local authorities are overwhelmed and are in desperate need of help, officials are reluctant to give authority to outside agents.

Challenges still confront both military and civil authorities on many fronts. The U.S. Northern Command (NORTHCOM), the unified command organized specifically to support the homeland defense of the nation, has had difficulty reaching out to state and local authorities. Civil authorities are not much help, either, as they have difficulties articulating what their needs might be, and the planners at NORTHCOM cannot read minds. Along with the long-standing issues related to interoperability of communications capabilities, command and control systems, and other homeland security protocols, NORTHCOM is often left with few forces or resources to offer to jurisdictions that need support.

As was recently documented in a Government Accountability Office report, NORTHCOM planning activities have been deficient, but the command is improving its planning capabilities. Furthermore, the command has had difficulties establishing readiness standards for its units. Because many of the forces that might be available to NORTHCOM in times of emergency are already tasked in foreign areas of operations, correcting these deficiencies might be well beyond the control of the command.

Another element of concern is the slow economic recovery ongoing in the nation. Resources at the state and local levels have diminished dramatically, leading to force and capability downsizing. Furthermore, preparedness activities have fallen in priority as jurisdictions struggle to keep schools open and police and fire departments fully staffed. Homeland security considerations become less compelling under the current circumstances. Similarly, Department of Defense budget priorities might force difficult decisions concerning NORTHCOM and military support to civil authorities.

NAVAL POSTGRADUATE SCHOOL

The Naval Postgraduate School (NPS), established and operated by the U.S. Navy, got a modest start at the United States Naval Academy at Annapolis, Maryland, in 1909 and since 1951 has been located in Monterey, California. Beginning with 10 officer

students and 2 navy instructors, the NPS has grown to a student body of more than 1,500 U.S. officers and government civilians and more than 250 military personnel from more than 60 other countries instructed by a faculty of 500 (90% civilian) professors, most of whom hold a PhD. According to its official website, the mission of NPS is to provide high-quality, relevant, and unique advanced education and research programs that increase the combat effectiveness of the naval services, other armed forces of the United States, and our partners, to enhance our national security. This entry discusses the history of the NPS and describes its centers and graduate schools, institutes, and curriculum.

Many of the most senior U.S. naval officers, as well as those of other American armed forces, are NPS graduates, including Admiral Michael G. Mullen, Chairman of the Joint Chiefs, General Michael W. Hagee, former Marine Corps commandant, and Admiral James D. Watkins, former chief of naval operations. NPS has educated more than 45,000 foreign officers and defense officials since its founding, and members among its alumni are King Abdullah of Jordan, the minister of defense of Thailand, the commander of the Turkish navy, the chief of staff of the Israeli air force, and the chief research scientist of Singapore's Ministry of Defense.

The school (which is in fact a fully accredited research university) is divided into four degree-granting graduate schools: (1) Business and Public Policy, (2) Engineering and Applied Sciences, (3) Operations and Information Services, and (4) the School of International Graduate Studies. NPS awards both master's and doctoral degrees. The graduate schools are in turn divided into 19 departments. The graduate schools and departments are augmented by four "institutes" for (1) Innovation and Information Security; (2) Modeling, Virtual Environments, and Simulation; (3) Systems Engineering; and (4) National Security. Finally, NPS features 33 "centers" that offer research and education programs in highly focused areas of study. Often led by interdisciplinary teams of faculty members, the centers explore a variety of areas ranging from civil-military relations to spaceship research and design.

In addition to its resident programs, NPS also offers graduate degrees to military officers through distance learning via "web-enabled, video tele-education" seminars and lectures. Teams of scholars also travel and teach overseas as part of NPS's

short-course programs that reach close to 50,000 students annually.

Only the U.S. Air Force sponsors an institution similar to the NPS. The Air Force Institute of Technology (AFIT) is also a doctorate-granting school. The U.S. Army does not have a comparable institution. Each service does have its own war college, which grants master's degrees to O-5 and O-6 military personnel, to U.S. government civilians of comparable rank, and to international officers.

The International Graduate Programs Office of the NPS is responsible for the cultural, social, and academic integration of the international military students and their families into the NPS. The office is charged with interacting with outside military and civilian agencies of the U.S. government to accomplish the goals of the Security Assistance Training Program and the Informational Program (IP). Additionally, it is responsible for the International Sponsor Program and acts as the Command Sponsor to the International Committee. The International Program at NPS has proven to be of great value in establishing long-term military-to-military relationships between the United States and other countries. More than 20% of currently enrolled international students are registered in Expanded International Military Education and Training (EIMET) certified programs, including Resource Management, Area Studies, and Security Studies. Approximately 5,000 international student officers have received NPS degrees since 1954.

History and Evolution of the NPS

According to its official website, the idea for establishing a graduate education program for naval officers first emerged in the late 1800s, but the concept initially had few advocates. However, with Guglielmo Marconi's invention of the "wireless" (telegraph) in 1901, the Wright brothers' flights of 1903, and the global cruise of the steam-powered Great White Fleet from 1907 to 1909, the belief gained support that advanced technical education for U.S. naval officers could be intrinsically valuable to the navy.

In 1909, Secretary of the Navy George von L. Meyer signed General Order 27 establishing a school of marine engineering at Annapolis, placing the fledgling school under the direction of the Naval Academy superintendent. The marine engineering school's 10 officers and 2 faculty set up shop in two attic rooms set aside by the academy for classes

and laboratory space. Within 3 years, Meyer had agreed to transform the school into the Postgraduate Department of the Naval Academy. His General Order 233 established courses of study in ordnance and gunnery, electrical engineering, radio telegraphy, naval construction, and civil engineering, as well as continuing the original program in marine engineering. With the additional curriculum content, enrollment increased to 25.

During World War II, Fleet Admiral Ernest King, chief of naval operations and commander in chief of both the Atlantic and Pacific fleets, established a commission to study the role of graduate education in the navy. By the end of the war, it had become apparent that the facilities of the NPS at the Naval Academy at Annapolis would be insufficient for the navy's future needs. In 1945, Congress passed legislation making the NPS a fully accredited, degree-granting graduate institution. Two years later, Congress authorized the purchase of the Hotel Del Monte and 627 surrounding acres in Monterey, California, for the establishment of an independent campus for the NPS. In December 1951, the NPS moved its 500 students, 100 faculty and staff, and tons of books and research equipment from the east coast to the west coast. Rear Admiral Ernest Herrmann supervised the transition.

The principal administrative offices remain in the former Hotel Del Monte, now named Herrmann Hall. The NPS academic quadrangle has been built incrementally since 1951. The most recent additions include renovation of the library, more than doubling its usable space, the academic building (Glasgow Hall), and the new mechanical engineering building. In 2006, renovation of the two wings of Herrmann Hall was completed, providing 140 new Bachelor Officers' Quarters (BOQ) rooms for the school's international officers and their families for temporary residency, while they become established in permanent living facilities. In the year of the NPS's centennial anniversary, 2009, Herrmann Hall began a series of renovations and refurbishments to restore the building's early-20th-century charm and elegance in tribute to its historic past.

Recent Developments

While technology and engineering were its original focus and remain a principal focus today, NPS has placed new emphasis on other curriculum areas in

recent years. Its School of International Graduate Studies has been in existence for less than a decade. Integral to the School of International Graduate Studies are the Department of National Security Affairs (NSA), the Center for Homeland Defense and Security, the Defense Resources Management Institute, the Center for Civil-Military Relations, the Center for Contemporary Conflict, the Center for Stabilization and Reconstruction Studies, and a program in International Defense Acquisition Resource Management.

The Department of NSA within the School of International Graduate Studies offers a master of arts degree and a doctoral degree in security studies. The MA degrees always entail concentration in a particular region or in a topical specialty. NSA regional security curricula meet the high standards set by the U.S. armed forces for foreign area officer education. Among the four regional curricula is Curriculum 681—"Middle East, South Asia, and Sub-Saharan Africa." Among the topical specialties offered by NSA is Curriculum 693—"Combating Terrorism: Policy and Strategy." Both Curriculums 681 and 693 are particularly relevant to ongoing military missions in Iraq, Afghanistan, and Libya.

The Global Center for Security Cooperation is another recent addition to NPS (established in 2006). Its mission is to provide additional capacity for extant Regional Centers: Marshall Center, Asia-Pacific Center for Security Studies, Near East South Asia Center, Africa Center, and the Center for Hemispheric Defense Studies.

The NPS Today

The U.S. NPS from its modest origins more than a century ago has developed into a world-class graduate teaching and research institution rivaling prestigious universities across the nation in theoretical and applied research and in fiscal impact. The Space Systems Academic Group of NPS has graduated 33 astronauts, more than any other graduate school in the country. NPS is home to the Center for Information Security and Research and the Center for Homeland Defense and Security—both of critical importance in the age of cyberwarfare and the Global War on Terrorism, respectively. Indeed, the Center for Homeland Defense and Security offered the first homeland security master's degree in the United States.

According to the 2010 NPS Annual Report, the total operating budget for the NPS for the fiscal year 2010 was \$379.1 million (approximately the cost of one F-22 aircraft in 2006 dollars, according to the Government Accountability Office). Funding comes from two primary sources. Direct funds are provided by the Department of the Navy for the school's core teaching mission. Reimbursable funds are provided from a variety of sponsors for the implementation of research and other unique educational programs. In 2010, a total of 1,188 degrees were conferred, including 18 PhDs in 11 fields.

NAVAL WAR COLLEGE

The Naval War College, located at Newport, Rhode Island, has provided the highest level of professional military education for the U.S. Navy since its founding in 1884. It provides both intermediate and senior levels of education. Its younger counterparts are the Army War College, the Army Command and Staff College, National Defense University, Air University, and Marine Corps University. Since 1990, the Naval War College has been accredited by the New England Association of Schools and Colleges to

award a master of arts degree in national security and strategic studies for its year-long course. About half of the midcareer resident students are officers from the U.S. Army, Air Force, Coast Guard, and Marines, while the other half are naval officers and civilian students from defense-related agencies. More than 100 officers from other navies attend the Naval War College annually. In addition, the college provides distance education faculty-led evening seminars in many locations throughout the United States as well as at bases overseas, a web-enabled program, and a correspondence program. At the end of the Naval War College's 125th anniversary year in June 2010, the resident graduating class included 303 navy, Marine Corps, air force, army, and Coast Guard officers, and civilian government employees, as well as 120 students from 68 different countries. With an additional 1,042 distance education students, the Naval War College graduated a total of 1,465 students in 2010. This entry discusses the history of the Naval War College and some of its illustrious leaders and influence.

Origins and Establishment

The first of the professional military colleges of its type to be established in the United States, the Naval War College owes its existence to U.S. Navy Rear Admiral Stephen B. Luce (1827–1917). In 1884, Luce had served for 40 years in the navy and had recently held the U.S. Navy's most senior command afloat as commander of the North Atlantic Squadron. Earlier in his career in 1862, he took an important role in naval education by producing the U.S. Navy's first textbook on seamanship, which served as the service's standard text issued nine times in five different editions over 40 years. Additionally, Luce played a key role in various types of maritime education and training. He was involved in the Marine Schools Act of 1874, the establishment of what is today the State University of New York Maritime College at Fort Schuyler, New York, and the naval recruit training program that was based afloat at Newport, Rhode Island, from 1877 and ashore from 1883.

After accomplishing his plans for recruit training, Luce turned to promoting the establishment of a school for the highest level of officer education. He thought that it was clear what kind of training an officer needed to rise to the command of a ship, but he saw there was no education readily available

for those who were destined to become admirals or advisors to senior officials. In thinking about this, Luce was profoundly influenced by his reading of the English historian Thomas Buckle (1821–1862) and his thoughts on inductive and deductive reasoning, the thoughts of the German philologist Friedrich Max Müller (1823–1900) on comparative study, and the pioneer article by Professor Sir John Knox Laughton (1830–1915) on the “Scientific Study of Naval History” (1874) that first encouraged broad analysis of naval events. In addition, Luce was also influenced by key contemporaries, among them Commodore Foxhall Parker (1821–1879) with whom he had helped establish the United States Naval Institute in 1873. Not long afterward, while in command of the USS *Hartford* in 1875–1877, Luce became an acquaintance of Colonel Emory Upton (1839–1881). These two men shared much in their outlook on service reform. With this orientation, Luce formed his ideas about the future Naval War College.

On November 6, 1882, Luce wrote to the secretary of the navy recommending a college to study the science of war, naval tactics, military and naval history, international law, and modern languages. The secretary of the navy took no action on Luce's recommendation until early 1884, when Luce drafted a General Order for the secretary's signature to establish the Naval War College. In response, Luce was ordered to convene a board to consider the ways in which to implement his recommendation. As members of the board, the secretary appointed Luce with Captain William T. Sampson and Lieutenant Commander Caspar F. Goodrich. Among the materials that the board members considered were examples of the army's schools, Luce's writings on war schools as well as the official report of the Naval Academy's professor James R. Soley (1850–1911), *Report on Foreign Systems of Naval Education* (1880), which included information on two interesting examples: the Royal Naval College, Greenwich, where John Knox Laughton had taught, and the Imperial German Navy's 3-year long, voluntary course at the *Marine Akademie* in the higher aspects of warfare.

The First Quarter Century, 1884–1909

On October 6, 1884, Secretary of the Navy William E. Chandler issued General Order Number 325 to establish the Naval War College as an advanced course of professional study for naval officers.

Even before it was signed, Luce began arranging for a faculty and was making arrangements for the new college to occupy the former home of the Newport County Poor Asylum, originally built 65 years earlier in 1819, on Coasters Harbor Island in Narragansett Bay.

Nearly a year later, on September 4, 1885, the Naval War College convened its first class. Its first full-time faculty members included Luce; Soley, a lawyer and historian who would serve as assistant secretary of the navy in 1890–1893, as lecturer on international law; and Army First Lieutenant Tasker Bliss (1853–1930), a future chief of staff of the army in 1917–1918, as lecturer on military science.

Luce also arranged for Captain Alfred Thayer Mahan (1840–1914) to be ordered from the command of a ship on the South American Station to become the first lecturer in naval strategy and tactics. Luce wanted Mahan to do for the navy what Antoine-Henri Jomini had done for the army and to create a theoretical understanding of the navy's strategic and operational roles. To start this, Luce ordered Mahan to spend a year studying the relationships between naval operations and foreign relations in European history. The result of this was a series of Naval War College lectures that eventually appeared as a book, *The Influence of Sea Power Upon History, 1660–1783* (1890), the first of his four-volume series. By the time Mahan finished his work and arrived in Newport to take up his teaching responsibilities, Luce had been assigned back to sea duty, and the navy ordered Mahan as his successor as college president.

The first quarter century of the college's existence was a fight for the fledgling institution's survival from its critics, who favored technical training over the broad educational mission that Luce had laid out for it. The college survived many attacks. In 1893, Secretary of the Navy Hilary Herbert had been deeply influenced by the critics and traveled to Newport with the intention of abolishing the College. En route, he read Mahan's most recent book, *The Influence of Sea Power Upon the French Revolution and Empire* (1892), which completely reversed his opinion of the college's work and led him to develop plans to sustain it and to develop it further.

From 1894, the college began to play a major role in naval contingency planning for the possibility of future wars and to employ as part of this the innovative concepts of naval war gaming that lieutenant, later captain, William McCarty Little (1845–1915)

was developing at the Naval War College from the German *Kriegspiel* along with some early ideas of Fred T. Jane (1870–1916) in England. As part of this, the Naval War College was closely involved with the navy's first contingency plans for the Spanish-American War.

Among the early visiting lecturers to the college was Theodore Roosevelt, who first came in 1888 to speak on his study of the War of 1812 and then in 1897 as undersecretary of the navy to give an address on preparedness as a means to prevent war. In 1908, as president of the United States, Roosevelt returned to the Naval War College, while the Great White Fleet was completing its circumnavigation of the globe under the former Naval War College president Rear Admiral Charles S. Sperry (1847–1911). This time, Roosevelt chaired a session of the Battleship Conference that he had convened to examine the design for a new American battle fleet.

Educating Leaders for the World Wars, 1910–1942

Over three decades, the Naval War College gradually developed an approach to naval planning and thinking that reached its apogee in 1934–1942 with the publication of the textbook *Sound Military Decision*, designed to prepare its students for high military command or staff assignments to senior commanders. Reflecting the curriculum of the time, this work focused on the mental logic for command and served as a manual for planning and a treatise on the profession of arms based on the concepts of “estimate of the situation” and the “order form.” All of the college's leaders in these decades contributed to this development; most famous among them were Admirals William S. Sims (1858–1936) and William Veazie Pratt (1869–1957). In 1934, the college built the navy's first purpose-built naval war gaming facility, Pringle Hall, which was used most famously to examine the options in War Plan Orange for the naval war against Japan. When the United States entered World War II, nearly every serving flag officer in the navy had graduated from the Naval War College.

Searching for a Role, 1942–1972

At the outset of World War II, 1923 Naval War College graduate Admiral Chester Nimitz (1885–1966) ensured that the college not be closed during the war years and carried out short courses. Immediately

after the war, Admiral Raymond Spruance (1886–1969), graduate and former faculty member, returned to the college as its president to begin the postwar transition. Spruance took the initial steps toward using civilian faculty, establishing a professional journal in what has since become the *Naval War College Review*, and preparing professional thinking for the Cold War era. With the establishment of the Defense Department, the need for joint thinking, and the application of business, management, and systems analysis approaches to professional military education, the Naval War College, like its sister war and staff colleges, was left in a quandary about the range and content of its curriculum and its institutional role. In this period, the college began its Naval Command course for senior international officers in 1956, while staff members Henry E. Eccles (1898–1986) and J. C. Wylie (1911–1993) made key original contributions to naval strategic thought in the 1960s.

A New Focus From 1972

In 1972, Vice Admiral Stansfield Turner (1923–) initiated a new educational approach that was inspired by his own graduate experience as a Rhodes Scholar at Oxford University. Emphasizing tutorials and seminar discussion with extensive reading and writing assignments, Turner implemented a permanent civilian faculty that taught three core courses successively in trimesters, a series of electives, and institutionalized research. Turner's basic concept has remained in place with incremental changes. In 1977, Medal of Honor recipient Vice Admiral James Stockdale (1923–2005) and Professor Joseph Brennan (1910–2004) introduced an innovative elective on military ethics, based on Stockdale's Vietnam experience. From 1981, innovative applied research was focused in a Center for Naval Warfare Studies with several series of Global War Games. As a result of the 1986 Goldwater-Nichols Act, the college was accredited to provide phase one joint education.

NAVIGATION, AERIAL

Air navigation is the process of piloting and navigating an aircraft from its present position to a destination. The basic principles of air navigation can best be understood by comparing it with the better understood process of land navigation, which is a valid comparison, up to a point. The fundamental function of both air and land navigation is to proceed from point A to point B. In land navigation, factors such as terrain, map reading, and compass accuracy are important considerations for planning. In air navigation, terrain, map reading, and compass accuracy are important, but each of these factors should be considered in a broader “air” context. This context includes a discussion of navigation aids available to pilots, high-level navigation versus low-level navigation, the unique dynamic of drift, and the different principles that govern piloting and air navigation.

Navigation Aids

Air navigation aids can be divided into two primary groups: (1) ground-based navigation aids and (2) stand-alone air navigation aids. Ground-based air navigation aids consist of, but are not limited to, Air Traffic Control (ATC) radar vectors, VHF Omnidirectional Range (VOR) instrumentation, and the Tactical Air Navigation (TACAN) system. With regard to platform navigation aids, nearly all

aircraft possess three stand-alone systems: (1) magnetic compasses, (2) Inertial Navigation System (INS), and (3) Global Positioning System. These systems are considered stand alone because they provide navigation data separate and apart from external (or ground-based) systems. In other words, these systems are capable of providing independent navigation solutions.

Ground-based air navigation aids represent those navigation systems that reside on the ground and assist in aerial navigation. ATC radar vectors consist of ground-based radar systems, which can “see” and track aircraft and thus vector the aircraft either at altitude or while the aircraft is in descent and approaching the airfield. Generally speaking, for military aircraft ATC radar vectors are not considered precision navigation and, as a consequence, are used to vector aircraft into unoccupied airspace or assist aircraft flying an approach. Aircrews continually verify the radar vectors they receive from ATC. VOR and TACAN navigation aids perform in similar ways. Both systems behave within a beacon-like framework. The ground-based VOR or TACAN systems send out beacons to receivers on compatible aircraft. The receivers then interpret the beacon and determine the azimuth and range to the ground-based station. This information allows the aircrew to navigate by either plotting their position based on the VOR or TACAN or to fly directly to the VOR or TACAN station. These are several significant differences between the VOR and TACAN systems. First, by itself the VOR only provides azimuth information. Second, the TACAN has a much greater range than the VOR system. Most aircraft use a combination of ground-based navigation systems to increase accuracy.

Of the three most common stand-alone air navigation systems, magnetic compasses are the simplest and provide the least amount of navigation data. Magnetic compasses provide magnetic headings. To properly navigate using magnetic compasses, wind speed and direction must be known and factored. Additionally, magnetic headings need to be logged and plotted on air navigation charts to track the progress of the aircraft (with consideration to wind effect) over time. In contrast, the INS provides an independent navigation solution. Using accelerometers to measure aircraft velocity (first axis) and gyroscopes to measure aircraft heading (second axis), the INS converts inputs into usable navigation data. Like

the INS, the Global Positioning System is a stand-alone navigation system. The Global Positioning System relies on satellite data (a minimum of three satellites for accurate solutions). Three or more satellites within the range of the aircraft receiver provide constant signals to and from the aircraft. These signals “triangulate” the aircraft position and provide highly accurate navigation solutions. While it is true any of the three stand-alone systems can be operated individually, most aircraft use a combination of air navigation systems to increase the accuracy of the solutions.

Unique Challenges of Air Navigation

High-level air navigation essentially entails all navigation and pilotage occurring in a high-level environment. (*Pilotage* is the act or skill of piloting.) Certain rules and requirements regulate this arena, such as radio communication with air traffic controlling agencies, filed instrument flight plans, specific navigation instrumentation requirements, and certain physiological equipment (e.g., oxygen supply) requirements. High-level navigation is almost always synonymous with instrument flight rules (IFR). In fact, aviators will often use the terms (especially IFR) interchangeably to represent the specific guidance, procedures, and protocols that govern high-level navigation. Low-level navigation, on the other hand, is more closely associated with visual flight rules (VFR). Since low-level navigation takes place at lower levels, the navigation techniques applied to it are much more visual. This means that aviators actually use visual references on the ground to help them navigate. For example, during a low-level sortie, it is not uncommon to navigate around the route using only visual ground references to determine flight path. Roads, bridges, towns, mountain ridges, and lakes all make wonderful low-level, visual navigation aids. Since low-level navigation is most closely associated with VFR, weather is a significant limitation to flying in low-level and/or under-VFR conditions. It is, then, effectively impossible to fly and navigate using visual reference points when the pilots cannot see the ground. Additionally, since navigation is occurring outside the high-level IFR structure, the rules governing flying at lower levels are much less restrictive with regard to equipment requirements. However, these rules place a much greater responsibility on the crew, as the pilots

(and any additional crew members) are ultimately responsible for safe navigation. This differs significantly from high-level navigation.

The dynamic of drift, probably more than any other factor, distinguishes air navigation from land navigation. Drift affects both high- and low-level navigation. Simply stated, drift is the effect of winds at altitude on the aircraft. For example, an aircraft that is traveling due east would continue to head in an easterly direction if wind was not a factor. If, however, the altitude wind is originating from the north, the aircraft is being “pushed” toward the south. The effect of this “push” is known as drift. Pilots, navigators, or flight planners must always take drift into account. If drift is not factored into air planning and air navigation, then wind can literally force the aircraft onto a path away from the intended destination. Another way to state the importance of drift is to consider that if drift did not exist, aircraft could travel in a relatively straight line from point A to point B and the need to plan for aerial navigation would be nearly entirely eliminated. In other words, it is drift caused by wind that makes air navigation even more necessary. Without drift, aircrew could simply set their courses/headings and fly to their destination, secure in the fact they would not get blown off-course.

The rules governing pilotage and navigation can be summarized by the two categories of IFR and VFR. As mentioned, IFR is usually reserved for high-level navigation. In basic terms, IFR is a designation in which the air traffic controllers share the responsibility of air navigation. Instrumentation, as the name implies, is integral to IFR procedures. Aircraft are under the control of both their instruments and the air traffic controllers, and as a consequence, aircrews can be considered less liable for their operations. Yet aircrews must always remain vigilant even when flying IFR to guarantee the safe navigation of their aircraft. Additionally, IFR flight involves many complex rules beyond the scope of this discussion. In contrast, VFR flight is less restrictive and provides the pilots and aircrews more control over their navigation.

VFR can be summed up as “see and avoid.” Pilots are responsible, while under VFR procedures, to see all obstacles (terrain as well as other aircraft) and to avoid all of those obstacles. Obviously, visibility is an important aspect of VFR, so weather plays a fundamental role. Aircrews planning to fly

VFR must always monitor the predicted weather for their projected flight path with diligence. Not to do so would be negligent.

NAVIGATION, SEA

Sea navigation is the processes maritime vessels use to determine their location in order to move to a certain destination. To determine their location, mariners use a variety of techniques, including dead reckoning, pilotage, celestial, radio, radar, and satellite, also known as Global Positioning System. These techniques employ basic navigation skills and tools such as latitude, longitude, bearing, distance to objects, and fixes. Sea navigation has an ancient history but has been brought into the 21st century with modern techniques, while still preserving the methods of the past, as discussed in this entry.

History

Modern sea navigation traces its origins to the ancient sailors of the Mediterranean Sea. Early navigators would stay within sight of the coast, using the land as a reference to their location. They would also use knowledge of wind and currents to determine the routes they would take. However, the rocky coast, along with the sudden storms of the Mediterranean, proved to be a challenge to sailors in keeping their ships afloat.

Early navigators began traveling farther out to sea, far from the dangerous coast. The Minoans of Greece began using records of celestial bodies to help guide them over open water, away from the landmarks of the coast. The most used constellation was Ursa Major, and more were used as they were discovered.

The medieval age saw the development of many tools that greatly advanced the art of navigation, such as the introduction of the magnetic compass, one of the most important tools of navigation. With the magnetic compass, navigators were able to find their way across open water without the aid of celestial bodies, by being able to determine the direction of north. Navigation went forward again with the sextant and marine chronometer. A marine chronometer is nothing more than a simple timepiece but is made special in its ability to remain precise in any weather, temperature, or level of humidity. In conjunction with the precise timing of a marine chronometer, a sextant was developed and used to find longitude from celestial bodies.

Latitude

Latitude is the term used to describe the imaginary lines that run east to west on the surface of the earth, parallel to the equator. With the equator set in the geographic middle of the earth, lines of latitude are both north and south of the equator.

All lines of latitude are represented by degrees (°). These degrees are determined by giving the degree of the angle the line of latitude has when compared with the equator. The equator is determined to be at 0° based on the angle it has when compared with itself. In contrast, a latitude of 90° forms a right angle when compared with the equator. This line of latitude would be at either the North Pole or the South Pole depending on whether it is north or south of the equator. Positions of latitude are given in degrees followed by an N or S, which states whether the line is north (N) or south (S) of the equator.

Longitude

Longitude functions in the same way as latitude. Degrees are given in W (denoting west) or E (denoting east). Much like latitude is based off the equator, longitude is determined by the angle from the prime meridian. The prime meridian is at 0° and runs from the North Pole to the South Pole. Lines of longitude extend east and west until they reach 180° at the International Date Line. This line marks the change in days. When crossing the International Date Line going east to west, the day advances ahead and vice versa. Unlike lines of latitude, lines of longitude are not parallel. Each one intersects with the others at the North and South Poles. Longitude does not stop

at 90°. Angles of longitude extend to 180°, meaning that all longitude lines must be given in three-digit format.

Vessels use both latitude and longitude to present their location on the earth's surface. When both are used, a location can be determined at the position in which the two lines cross. For example, the approximate latitude and longitude of New York City is 40°N, 074°W, meaning that New York City lies on the line that is 40° north in relation to the equator and 074° west of the prime meridian.

It is also important to note that a position of a ship can be determined by a given latitude and longitude and given in latitude and longitude if the position was found by other means.

Bearing

Bearings are measurements taken from a navigating vessel to determine the direction of an object, such as other ships. Bearings are based on compass directions and given in three-digit format. To determine a bearing to an object, a mariner determines which direction is north (000°). From that, an angle is found that compares the direction of the object to north. For example, a ship coming directly from the east is said to have a bearing of 090° because the angle of north and the ship is 90°. These angles can be as large as 359°, as a compass is a circle.

It is important to note that heading is entirely different than bearing. Heading is the measurement of which direction, or course, a vessel or object is moving on a compass. If a ship is moving directly west, it is said to have a heading of 270°.

Distance to Objects

Distance to objects is an important step in determining location of a vessel. By using whatever means available, a mariner can use distance in relation to known and charted objects to determine location. By finding an object and the distance a ship is away from it, a mariner can find the same object on a chart, which is a type of map specifically used for nautical navigation, and draw the distance from that object using a scale bar, a tool on a chart used to represent distances in a smaller frame. With the distance and the object, a mariner can draw a circle around the object at the scaled distance. The mariner then knows that the vessel is somewhere along that circle. The mariner will most commonly find

another object and repeat the process. The two circles will intersect at two spots, giving the mariner two possible locations. The process may be repeated a third time to receive the most accurate positioning.

Positional Fix

A positional fix, or simply fix, is the term used when determining a location on a chart. Through the use of latitude, longitude, bearing, and distance to objects, a position can be determined quickly and easily. Most commonly, fixes are taken by either using longitude and latitude or bearing and distance to objects, separately. The process of finding a location is known as “taking a fix.”

Dead Reckoning

Dead reckoning is a special process to determine location but does not utilize latitude and longitude or bearing and distance to objects in its process of taking a fix. Instead, a vessel uses its known heading, speed, and time elapsed. The current speed is multiplied by the elapsed time to give the distance a vessel will travel in that time. The heading determines in which direction the ship is moving. Combining the direction and distance the ship will travel, a mariner plots, or draws the position of the ship on a chart. This gives the approximate position of the ship and can give the approximate latitude and longitude.

A more advanced version of dead reckoning is inertial navigation. Through several sensors on board a vessel, a computer system can automatically determine a position through dead reckoning. These sensors measure ship movement forward and backward and side to side to determine movement. These sensors along with a compass use the same methods to determine a position as with dead reckoning.

Pilotage

Pilotage is another way of determining an approximate position without using latitude and longitude or bearing and direction. Pilotage works by comparing a chart of the area a vessel is thought to be in to what can be visually seen. This is one of the most common methods of navigation for small boats. The use of buoys plays an important role in pilotage. Each buoy can have a distinct color, number, and style, all of which can be compared with buoys

on a chart. This is important when vessels navigate through hazardous waters and channels. Also, by identifying geological features, such as mountains and coastlines, and human-made features, such as buildings and bridges, a mariner can compare them with a chart and determine an approximate location. If a certain building is shown on a chart, a mariner can compare the location of it in relation to the vessel and determine an approximate position.

Celestial

Celestial navigation is the process of determining a location through the observation of celestial bodies, such as the sun, moon, and stars. Through using a sextant, a skilled mariner determines which stars are overhead. With a nautical almanac, which lists the positions of stars during certain months, a mariner sees where the star is positioned over the earth on that particular day. By cross-referencing celestial bodies to a nautical almanac, a mariner can determine a vessel's position.

Radio

Radio navigation is a process for finding location through radio signals. In the same way a mariner finds bearing through visual identification, a receiver listens for signals coming from a dedicated transmitter. The transmitter's location will be known, and by using the receiver, a bearing of where the signal is coming from is found. Using this process, combined with other radio signals and bearing-finding processes, a fix can be taken.

Radar

Radar, which is an acronym for radio detection and ranging, works in the same fashion as radio navigation. The difference is, the vessel sends out its own signal, which reflects off objects and comes back to the source's receiver. Bearing is found to an object, and speed and time elapsed determine the distance to an object. The bearing and distance are plotted on a chart to determine location.

Satellite

Satellite navigation uses satellites in the earth's atmosphere to determine a latitude and longitude in order to produce a fix. A receiver on a vessel receives the signals transmitted by the satellites, which have a

known position above the earth's surface. By receiving several different satellites' signals, a receiver can display location, speed, and direction.

Passage Planning

Passage planning is the planning of a vessel's movement from origin to destination. Passage planning is important to determine the route a vessel will take and how long it will take the vessel to get to the destination, as well as to prepare for any potential changes that may occur. A plan is usually laid on a chart well before the voyage starts. Utilizing many, if not all, of the ways to determine position, a ship constantly checks to make sure that the plan is adhered to in order to make specific deadlines.

Modern Ship Bridge Systems

Today's sailors use various means to determine their location and safe passages. Most modern ship pilot-houses utilize a computer system that is able to determine a ship's location via Global Positioning System and latitude and longitude, display the chart for the given area, and precisely record its past, current, and possible future movements, all on one screen. This has greatly simplified the process that sailors use to safely navigate from one area to another. Even with this highly advanced system, most navigators still practice and use the older, manual methods of navigation as a backup in the event of a system failure. During some of the most dangerous shipping events, such as pulling in and out of port, navigators still rely heavily on a lookout taking bearings to landmarks on the coast, while verifying with a computer-assisted system.

NAVY, DEPARTMENT OF

Directed by a civilian secretary of the navy, the Department of the Navy oversees the administration of the U.S. Navy, including the construction, maintenance, and repair of ships; the recruiting, training, and mobilization of navy and Marine Corps personnel; equipment and supply; and related matters. Currently, the secretary of the navy is assisted by the undersecretary of the navy and four assistant secretaries and advised by the chief of naval operations and commandant of the Marine Corps, respectively, the senior navy and marine officers. This entry discusses the history of the U.S. Department of the Navy and its structure and examines the impact of influential secretaries of the navy.

During the Revolutionary War, the Continental Navy passed through several administrative arrangements. Congress established a 3-man Marine Committee in October 1775, which it increased to 7 and then 13. Cumbersome and inefficient, Congress replaced it with a Board of Admiralty in 1779. Its three members relied on the advice of Robert Morris, the superintendent of finance, and in September 1781, Congress dissolved the board, and Morris assumed its responsibilities. Following the war, Congress abolished the navy in 1785.

Following worsening relations with France, Congress authorized six frigates in 1794, though construction delays did not necessitate the establishment of a Department of the Navy until April 30, 1798. Directed by a secretary of the navy, a member of the president's cabinet, it would oversee the navy, as well as the Marine Corps, which Congress reestablished on July 11, 1798.

President John Adams appointed Benjamin Stoddert, a Maryland merchant and shipbuilder, the first secretary of the navy. Assisted by a few clerks, Stoddert directed the fleet, secured its provisions, enlisted its personnel, and supervised the construction and maintenance of its ships, which acquitted themselves well against France (1798–1800) and later against the Barbary pirates (1801–1805). Following the War of 1812 (1812–1815), Congress established the Board of Navy Commissioners. Composed of three senior captains, it oversaw procurement, construction, and related matters.

Secretary of the Navy Abel P. Upshur recognized the need for greater technical expertise, and in 1842,

he replaced the board's three captains with five chiefs, each in charge of a different bureau: (1) Yards and Docks; (2) Construction, Equipment, and Repair; (3) Provisions and Clothing; (4) Ordnance and Hydrography; and (5) Medicine and Surgery. Over the next generation, the fleet's growing size and new technologies, as well as fighting the Civil War, forced further expansion of the naval bureaucracy. In 1862, Congress added the Bureaus of Steam Engineering and Navigation. The latter oversaw ship deployments and officer assignments. Secretary of the Navy Gideon Welles appointed the former naval officer Gustavus V. Fox as assistant secretary of the navy, though this post did not long survive the Civil War.

Beginning in the 1880s, Congress funded a tremendous naval expansion. Congress reestablished the assistant secretary position, but the navy addressed its other administrative needs through a series of ad hoc arrangements. Secretary of the Navy Benjamin Franklin Tracy formed the Construction Board in 1890 to coordinate the five bureaus involved in ship construction. During the Spanish-American War (1898), Secretary of the Navy John D. Long formed a temporary board of officers to advise him on strategy. In 1900, he created the General Board, an advisory body whose officers studied matters from personnel policy to new technologies.

To achieve greater coordination among the bureaus, whose chiefs operated with great independence, Secretary of the Navy George von Lengerke Meyer in 1909 appointed four naval officers as aides to assist him, one each for operations, personnel, material, and inspections. These grew into a naval staff system under his successor, Josephus Daniels, who appointed Admiral William S. Benson the first chief of naval operations (CNO) in 1915. The CNO became the secretary of the navy's principal adviser and directed the Office of Operations, which absorbed a host of administrative and planning duties. The bureaus, though, remained, and in 1921, Congress added the Bureau of Aeronautics.

The Navy Department functioned well through World War II, but the war's end found air force leaders campaigning not only for the separation of the air force from the army but also for control of all aviation including naval aviation. Army leaders, in turn, hoped to absorb the Marine Corps. The 1947 National Security Act established the air force as an independent service and subordinated the secretaries of the navy, army, and air force to the secretary of

defense, who led the Department of Defense. Yet tensions between the services remained and exploded in 1949 when Secretary of Defense Louis Johnson cancelled construction of an aircraft carrier, signaling the navy's diminishing role in national defense and a commensurate reduction of its budget. Secretary of the Navy John L. Louis resigned in protest, and CNO Louis E. Denfield unsuccessfully led what the press labeled the "revolt of the admirals."

The Korean War helped restore the navy's fortunes, but the Navy Department's purview continued to narrow. It disbanded the General Board in 1951, and growing centralization under the Department of Defense led to the elimination of the navy's bureaus. Instead, four assistant secretaries directed manpower and reserve affairs, installations and logistics, financial management, and research and development, while six deputy chiefs for surface warfare, submarine warfare, air warfare, logistics, plans and policy, and manpower served under the CNO.

Navy secretaries found little role in policy making until President Ronald Reagan's arms buildup in the 1980s gave voice to Secretary of the Navy John Lehman, who announced a "new maritime strategy." Rather than the defensive sea control and convoy protection advocated by his immediate predecessors, Lehman emphasized offensive action against the Soviet Union in the event of war. The Soviet Union's collapse made the mission irrelevant not long after Lehman articulated it. His successors have since struggled to articulate a clear mission for the navy in the post-Cold War world. Beginning with H. Lawrence Garrett III (1989–1992), they have emphasized waging war "from the sea," that is, using naval power to intervene in regional conflicts, a mission further articulated and clarified under Secretaries of the Navy John H. Dalton (1993–1998), Gordon England (2003–2005), and Ray Mabus (2009 to the present).

NAVY, U.S.

The U.S. Navy boasts the world's largest fleet with 288 warships and submarines (as of March 2011) and more than 3,700 aircraft. Slightly more than 320,000 personnel serve on active duty in the navy and roughly another 100,000 are in the Reserves. It is the only navy with global reach, able to project power to any part of the world. The U.S. Marine Corps, which is also administered by the Navy Department, includes slightly more than 200,000 active-duty personnel and about 40,000 reservists. This entry discusses the history of the U.S. Navy, including its wartime and peacetime missions and the role of the navy today.

Compared with the U.S. Army, and later the U.S. Air Force, peacetime operations have significantly shaped the navy. Its ships policed the seas, protecting American commerce and helping it expand into new markets, and conducted diplomatic and exploratory missions. In war, the navy protected the American coast and attacked enemy commerce. As the navy expanded in the 19th century, it improved its amphibious warfare capabilities and ability to project power within the American hemisphere, a mission encouraged by Alfred Thayer Mahan, who called on Americans to “look outward.” In the 20th century, the U.S. Navy became the largest navy in the world, able to project power to the furthest corners of the planet. Its peacetime missions remained important and ranged from economic blockades and commerce protection to humanitarian missions. In the past 20 years, American warships have rendered vital aid in more than 100 crises, including tsunamis in Indonesia (2004) and Japan (2011) and the 2010 Haitian earthquake.

The Sailing Era

During the American Revolution (1775–1783), Americans capitalized on their rich maritime heritage

to construct a regular navy and outfit almost 3,000 privateers. The latter captured about 2,200 British merchant ships during the war. Apart from a successful raid on Britain's Caribbean possessions, the few dozen Continental Navy warships raided British commerce and conducted diplomatic missions. Their few successes, particularly that of John Paul Jones, who captured the British frigate *Serapis*, provided a heroic model for future naval officers. Members of Congress, though, saw little need for a navy and sold its remaining warships in 1785.

Increasing tensions with Britain and France and the depredations of pirates convinced Congress to recreate the navy in 1794 and authorize the construction of six frigates. The fleet grew slowly afterward and operated successfully against French warships and privateers in the Quasi War (1798–1800) and pirates in the Mediterranean (1801–1805). Despite some successes, the U.S. Navy fared poorly against Britain's large fleet in the War of 1812. Americans again relied on privateers to harass enemy commerce, while they rushed new warships to completion. Victories on Lake Erie (1813) and Lake Champlain (1814) resulted from bold American leadership and superior shipbuilding capability on the Great Lakes. Similar boldness, along with the heavy armament of American frigates, produced victories in several single-ship engagements in the Atlantic. Yet the nation's outnumbered warships could not prevent the Royal Navy from sailing where it pleased and landing troops that burned Washington, D. C., in 1814.

After the war, the navy laid up its largest warships, while frigates and smaller vessels resumed their distant patrols. American warships patrolled the African coast to halt the slave trade and protected American commerce, sometimes violently, as in 1832 when the American frigate *Potomac* retaliated for the murder of several dozen American merchant seamen in Sumatra by bombarding the village where the murders occurred. Naval officers secured trade treaties with the Ottoman Empire and Thailand, and Lieutenant Charles Wilkes led an expedition to Antarctica. The 1853 expedition of Commodore Matthew Calbraith Perry to Japan proved the culmination of American naval diplomacy in the antebellum years.

The navy improved its administration by creating five specialized bureaus to oversee technical matters in 1842. The Naval Academy opened in Annapolis, Maryland, in 1845, ending the days in which officers

learned their entire craft at sea. Improved education for sailors lagged that of officers, though the navy abolished flogging in 1850. An increasing number of its warships boasted steam engines, and during the Mexican-American War (1846–1848), these blockaded Mexico's coast and supported the conquest of California and the march of General Winfield Scott's army from Veracruz to Mexico City.

The majority of the navy's personnel remained loyal during the Civil War (1861–1865), providing a foundation for the dramatic expansion of the fleet from 90 to 671 ships. The 1862 engagement between the *Monitor* and the *Virginia* confirmed the importance of steam power and armor for warships, and the placement of the *Monitor*'s main armament in a revolving turret became standard. Union warships led amphibious expeditions that seized New Orleans (1862) and other ports along the southern coast, and their blockade slowly strangled

Confederate trade. In the western theater, Union gunboats gained control of the nation's interior waterways, split the Confederacy, and opened the heartland to invasion.

A Fleet of Iron and Steam

After the Civil War, Congress authorized few new ships, and the fleet declined in size and quality. The growing technological gap between the U.S. Navy and European fleets inspired a host of reform and modernization proposals from officers who found a voice for themselves in the *Proceedings*, the journal of the U.S. Naval Institute. Among the most influential were Stephen B. Luce and his protégé Alfred Thayer Mahan, who guided a cohort of young officers. Together, they lobbied for the modernization of the fleet and the reorientation of American naval strategy from commerce raiding and coast defense

USS *Michigan* and other American ships in Veracruz harbor during the U.S. occupation of Veracruz, Mexico, which took place during the Mexican Revolution. Photo taken in 1914.

to sea control. Rather than small, fast cruisers, the navy should build large battleships and concentrate these to gain control of the seas through decisive fleet engagements.

Members of Congress increasingly agreed, funding the construction of a growing number of large warships after 1890. It was a fleet for an imperial era and supported an aggressive American foreign policy in the Caribbean and Central America. American squadrons overwhelmed their opponents in the Spanish-American War (1898) and supported military operations in Cuba and the Philippines. Over the next generation, this new navy deterred European intervention in the Americas, secured Panama as an American protectorate (1903), and demonstrated its global reach in the round-the-world voyage of the Great White Fleet (1907–1909). The navy added bases in Hawaii, the Philippines, and Cuba. The completion of the Panama Canal in 1914 allowed it to shift ships quickly between the East and the West coasts. Construction of ever-larger battleships continued, and the United States entered World War I in 1917 with a fleet second in size only to Great Britain. Two years earlier, Congress created the post of chief of naval operations (CNO) to direct the navy.

During World War I, American warships helped enforce the Allied blockade of Germany, laid 70,000 mines across the North Sea from Norway and

Scotland to contain German submarines, escorted convoys, hunted German submarines, and ferried hundreds of thousands of American troops to Europe. Reorganized in 1915, the Coast Guard played an important role in this campaign, as it would in future wars when it operated under navy orders.

After the war, the United States led the effort to prevent another naval arms race and secured agreement by the remaining naval powers to the Washington Naval Treaty (1922). This established a strict ratio of fleet size among the United States, Britain, Japan, France, and Italy and limited the number and size of battleships and aircraft carriers in their fleets. The 1930 London Treaty extended these limitations to cruisers, but other interwar arms limitation efforts failed. Nonetheless, the economy-minded Republican presidents of the 1920s restricted naval funding and kept the fleet well below treaty limits. President Franklin Roosevelt reversed these policies in the 1930s and enlarged the fleet as war became likely. By 1940, the United States had 488 new warships under construction, and the 1940 Naval Act authorized another 200.

Between the two World Wars, the U.S. Marine Corps developed doctrine for amphibious warfare and made this its primary mission and the foundation of its relationship with the navy. The navy, which acquired its first airplanes in 1911, continued

to expand its aviation program as a succession of air-minded officers overcame the reservations of senior officers and congressional emphasis on battleship construction. Well before the Japanese attack on Pearl Harbor on December 7, 1941, the American fleet reflected the importance of air power, which it embodied in six new aircraft carriers.

For the U.S. Navy, World War II began before Japan attacked Pearl Harbor. Marines occupied Greenland and Iceland, and by mid-1941, American warships patrolled the Atlantic and escorted convoys partway to Britain. American warships occasionally clashed with German submarines, and these launched devastating attacks on American shipping following Germany's declaration of war on the United States on December 11, 1941. The Allies had gained the upper hand in the Atlantic by May 1943, thanks to new tactics and technologies and tremendous American construction of cargo ships and warships. A growing volume of American troops and supplies reached Britain safely, and Allied armies launched successful amphibious invasions of North Africa, Sicily, Italy, and France.

In the Pacific, American fleets halted the Japanese advance at the Battles of the Coral Sea (May 7–8) and of Midway (June 3–6). These victories allowed American forces to take the offensive, invading Guadalcanal and then advancing up the Solomon Islands and along the New Guinea Coast. On November 20, 1943, U.S. Marines invaded Tarawa, beginning a drive across the Central Pacific. The United States seized key islands in the Gilberts, Marshalls, and Marianas. The latter provided bases for B-29 bombers that devastated Japanese cities. The navy continued its advance, landing army

and marine forces in the Philippines, Iwo Jima, and Okinawa. Concurrently, American submarines attacked Japanese shipping. By the war's end, little remained of either the Japanese navy or merchant marine. In contrast, the U.S. Navy outnumbered all the world's navies combined, with 1,194 warships of destroyer size and larger, 1,256 amphibious transports, and 41,000 aircraft.

The Cold War Navy

The navy demobilized rapidly after the war, falling to 300 warships. Critics questioned the need for a navy and argued that air power and nuclear weapons would win future wars. Air force leaders hoped to absorb naval aviation, while army leaders suggested eliminating the Marine Corps. Fierce lobbying produced a compromise in the National Security Act of 1947, which gave the air force its independence and created the Department of Defense with separate secretaries for each of the three services who reported to the new secretary of defense.

Yet interservice disputes exploded in 1949 when the newly appointed secretary of defense, Louis A. Johnson, cancelled construction of a new aircraft carrier. Secretary of the Navy John L. Sullivan resigned in protest, and the press dubbed the acrimonious protests of the navy's senior leaders the "revolt of the admirals." Air force and navy leaders traded barbs over the respective capabilities of carrier aviation and the air force's B-36 bomber, while Johnson threatened to reduce the navy to only four aircraft carriers. Only growing tensions with the Soviet Union and the Korean War forced the restoration of the navy's funding.

The navy proved critical to UN operations in Korea (1950–1953). An amphibious landing at Inchon sent the North Korean army reeling northward, and naval forces evacuated UN troops from Hungnam after the Chinese intervened. Navy ships secured the sea, transported supplies, and supported troops with naval gunfire and air strikes. More often during the Cold War, the navy conducted operations short of war, protecting Taiwan during repeated crises, delivering marines to Lebanon (1958), and blockading Cuba during the Cuban Missile Crisis (1962).

The United States launched an ambitious program to build nuclear-powered ships. Beginning with the 1955 launch of the USS *Nautilus*, nuclear-powered submarines replaced older diesel-electric boats. A handful of surface warships received nuclear power plants, as did a growing number of aircraft carriers, including the USS *Enterprise* (1961), USS *Nimitz* (1975), and nine additional *Nimitz*-class carriers commissioned between 1977 and 2009. In 1962, the navy launched its first submarine armed with ballistic nuclear missiles. These became an important part of the nation's nuclear force, the Triad, composed of air force bombers and land- and submarine-based missiles designed to deter and, if necessary, fight a nuclear war. The navy's officer corps remained divided among aviators, submariners, and those who sailed surface warships, with aviators generally in ascendance and crafting strategies that emphasized offensive carrier operations.

During the Vietnam War, navy aircraft carriers launched regular air strikes, while smaller warships patrolled South Vietnam's coast and rivers to prevent enemy troop and supply infiltration. The war's cost and postwar inflation curtailed naval building, and the fleet fell to 336 ships and submarines by 1978. Yet it remained active in the 1980s, including the failed effort to rescue American hostages in Iran launched from the USS *Nimitz* (1980), the support of interventions in Lebanon and Grenada (1983), two clashes with Libyan aircraft and warships (1981 and 1986), and protection of shipping in the Persian Gulf during the Iran-Iraq War (1980–1988).

President Ronald Reagan and Secretary of the Navy John Lehman vowed to reinvigorate the navy and increase its size to 600 warships and submarines, but growing budget deficits made this difficult. The fleet peaked at 594 in 1987 and then

declined. Lehman resigned in protest over reduced budgets, as did his successor, James Webb, in 1988. As the navy retired older ships, the fleet fell to 471 ships in 1992.

Advancement Opportunities for Women and African Americans

In the 20th century, the navy generally lagged behind the other services in offering opportunities to women and African Americans, particularly the Coast Guard, which ended the combat exclusion for women in 1973. Only in the 1970s did the first African Americans and women achieve the rank of admiral, an important landmark in their struggle for inclusion and equal treatment.

African Americans accounted for about one sixth of the navy's personnel in the War of 1812 and the Civil War, though none served as officers. After the Spanish-American War, the navy increasingly limited opportunities until African Americans served only as mess stewards. Recruitment of African Americans expanded during World War II, and for the first time, some were commissioned as officers. Mimicking the army's Black regiments, the navy crewed the destroyer escort USS *Mason* and a few other small warships almost entirely with African Americans. The navy slowly desegregated after the war, but racial tensions persisted, highlighted by race riots that broke out on several ships in 1972. These forced the navy to update its policies, a job eagerly embraced and effectively executed by new CNO Admiral Elmo Zumwalt.

Opportunities also expanded for women in the 20th century. The navy established the Nurse Corps in 1908, and women briefly served in shore positions during the First World War. Created in 1942, the WAVES (Women Accepted for Volunteer Emergency Service) served in a growing number of positions during World War II, eventually totaling 78,000. The navy began training female pilots in 1973, the Naval Academy accepted its first female midshipmen in 1976, and Congress authorized women to serve aboard noncombatant ships in 1978 and warships in 1994. Opportunities steadily expanded afterward, culminating in a 2010 Navy Department decision to allow women to serve on submarines. Complaints of sexism, though, persisted and were highlighted by charges of hazing at the Naval Academy and a series of incidents at the Tailhook Convention of

Captain Maureen Farren took command of the USS *Mount Vernon* (LSD-39) in June 1998. She was the first U.S. Navy woman to command a combatant ship. This photo shows the then navy lieutenant Farren, officer in charge of the surface effect ship SES 200, posing in front of the ship in dress uniform wearing the Navy Achievement Medal.

naval aviators during which two dozen women were harassed in 1991.

After the Cold War

The end of the Cold War did not lessen the navy's missions, which CNO Admiral Carlisle Trost (1986–1990) listed as strategic deterrence, forward defense, sea control and maritime protection, power projection to crisis areas, and supporting American allies around the world. Following Iraq's August 1990 invasion of Kuwait, American warships including two aircraft carrier battle groups deployed to the

Persian Gulf to establish a blockade and deter the Iraqi leader Saddam Hussein from invading Saudi Arabia. Sealift carried 90% of the cargo for the allied buildup. Naval air and cruise missile attacks helped open Operation Desert Storm, the American-led liberation of Kuwait, while the threat of amphibious invasion distracted Iraqi commanders. After the war, U.S. Navy aircraft helped patrol the no-fly zones over Iraq and supported military operations in Somalia (1992–1993), Haiti (1994–1995), Bosnia (1995), and Kosovo/Serbia (1999–2000).

American warships rapidly redeployed to threatened areas following the September 11, 2001,

terrorist attacks on the World Trade Center and Pentagon. Naval air and missile strikes supported operations against the Taliban in Afghanistan the following month, and special operations forces and marines deployed into Afghanistan from navy aircraft carriers and amphibious ships. Following the Taliban's defeat, navy personnel occupied important positions in support and reconstruction efforts in Afghanistan. Navy Special Forces operated against insurgents and led the raid into Pakistan that killed the al Qaeda leader Osama bin Laden in 2011.

Navy forces played a similar role in the March 2003 invasion of Iraq. Navy cruise missile strikes again opened the campaign, along with strikes by air force stealth aircraft, and navy aircraft participated in the air campaign that shattered the Iraqi command system and supported the advance of U.S. forces, which included the 1st U.S. Marine Division. After the collapse of Saddam Hussein's regime, navy personnel joined the reconstruction effort in growing numbers. By 2010, 14,500 sailors served on land in Iraq and Afghanistan, outnumbering those at sea in the region.

Following the Soviet Union's demise, navy leaders abandoned their century-long emphasis on fighting fleet actions at sea and instead emphasized projecting power ashore from the sea and closer cooperation with the Marine Corps, which described its role as "operational maneuver from the sea." Continuing revisions of strategic statements emphasized this partnership between the navy and Marine Corps, placing the two on almost equal footing. The inclusion of the Coast Guard in *A Cooperative Strategy for 21st Century Seapower* (2007) marked a similar increase in that service's status. The strategy emphasized forward presence, deterrence, sea control, power projection, and humanitarian assistance—something never before considered a core mission.

Wars in Afghanistan and Iraq and rising construction costs forced the continuing reduction in fleet size, which navy leaders hoped to slow by designing ships to last 40 years and aircraft carriers to serve 50 years. Vice Admiral Arthur Cebrowski, president of the Naval War College (1998–2001), hoped "network centric warfare"—leveraging advanced computer and information technologies—would enhance the navy's effectiveness. CNO Admiral Michael Mullen (2005–2007), appointed chairman of the Joint Chiefs of Staff in 2007, accepted the fleet's continued decline but envisioned a 1,000-ship

navy to which "all freedom-loving" maritime nations would contribute to police the seas.

The 2011 establishment of a no-fly zone to support Libyan rebels opened with naval air and missile strikes that demonstrated the U.S. Navy's ability to rapidly respond to crises. While critics continue to decry its diminished size, it remains the world's largest, outnumbering its rivals and particularly dwarfing them in tonnage thanks to its 11 large aircraft carriers that remain unmatched by any potential rival.

NAVY LEAGUE

The Navy League is a nonprofit advocacy organization that works to educate Americans about the importance of sea power to the nation and promote the needs of the U.S. Navy, U.S. Marine Corps, merchant marine, and Coast Guard through education, lobbying, grassroots promotions, and other public relations activities. Over its century-long history, it has lobbied for naval expansion, provided comfort packages and other supplies to sailors and marines during war, raised funds for maritime museums, and engaged in a host of grassroots educational activities. Unlike many similar organizations, the Navy League bars serving officers of the armed forces from membership, and this has allowed it greater independence to challenge government policy. This entry describes the history and functions of the Navy League.

Origin

Inspired by the patriotic naval leagues founded in Britain (1894), Germany (1898), and other countries, members of the New York State Naval Militia, Naval Academy Alumni Association, and other naval advocates formed the Navy League of the United States in December 1902. They opened league membership to any American regardless of race, gender, or political affiliation, elected the former secretary of the navy Benjamin Franklin Tracy as president, and issued a succession of pamphlets urging continued naval modernization and expansion.

The league grew slowly to 4,769 members in 1907, which disappointed founders who expected rapid growth to match the German league's 500,000 members. The voyage of the Great White Fleet (December 16, 1907, to February 22, 1909) presented the league an opportunity. On its return, the league published *Patriotic Reasons for the Navy League of the United States* and sent the fleet's commander, the recently retired admiral Robley Evans, on a nationwide tour to recruit members. The league also awarded honorary memberships to the former president Theodore Roosevelt, six former secretaries of the navy, and other prominent navalists who helped build its membership to 7,000 by 1911.

World War I

World War I proved a boon for the league, and membership soared, particularly after a German submarine sank the *Lusitania*. Mimicking the initiatives of the growing number of preparedness organizations, the league organized an unofficial naval reserve of private yachts and encouraged the training of voluntary naval reservists. It launched *Sea Power* magazine to promote its agenda and successfully championed the 1916 Naval Act, which included most of its platform including 156 new ships, a naval reserve, and merit-based promotion.

After the United States declared war, the league assisted the navy's recruiting efforts by distributing more than a million enlistment pamphlets, stickers, and handbills and provided aid and comfort to sailors, marines, and their families. It provided knitting instructions to more than 300,000 women who produced more than two million wool garments for distribution to sailors and marines in addition to books, playing cards, tobacco, toothbrushes, and other items.

Interwar Years

The league continued this work throughout the war despite an acrimonious dispute with Secretary of the Navy Josephus Daniels that resulted in Daniels banning all league volunteers from navy installations. It ended the war in debt, and its rapidly declining membership forced it to cease publishing *Sea Power*. To raise public awareness, the league organized the first Navy Day celebration on October 27, 1922, Theodore Roosevelt's birthday. Navy ships hosted thousands of visitors in ports around the nation, and it became an annual event. A million people toured naval vessels the following year, and these annual celebrations often resulted in editorials favorable to the navy.

While the league argued against arms limitation, it accepted the restrictions of the Washington Naval Treaty (1922) and London Naval Treaty (1930) and urged Congress to fully fund the navy treaty and maintain parity with Britain's navy. Yet the U.S. Navy remained well below treaty limits, and the league denounced President Herbert Hoover for "abysmal ignorance" and neglecting the navy. Pacifists, in turn, linked the league to a conspiracy of "merchants of death."

The New Deal and World War II

During the New Deal, league leaders successfully argued that shipbuilding would produce jobs, and they helped secure passage of the Vinson-Trammell Act (1934), which funded sufficient construction to bring the navy to treaty limits. Corporate donations funded the renewed publication of *Sea Power*. The league warned against Japanese imperialism, attacked isolationists, encouraged closer relations with Britain, and helped secure passage of large naval appropriations in 1938 and 1940. After the attack on Pearl Harbor, league members, whose number reached 18,781 in 1945, made clothing for sailors and provided them with books, athletic equipment, cigarettes, and similar items. They organized blood drives, arranged entertainment for sailors and marines, and spent time with those convalescing in hospitals.

Cold War

After the war, the league unsuccessfully opposed the National Security Act of 1947, which unified the armed services under the Department of Defense.

When senior navy leaders denounced Secretary of Defense Louis Johnson's cancellation of the aircraft carrier USS *United States*, the league mobilized to support them. Like Daniels, Johnson retaliated by restricting league members from navy ships and installations.

The league reoriented to work more with industry and the youth during the Cold War. It created the Navy Buddy Program and later the Sea Cadets to educate teenagers about maritime affairs. The league supported museums, helping raise funds for the Naval Aviation Museum in Pensacola, Florida, and the installation of a captured German submarine at the Chicago Museum of Science and Industry. It also created an annual Sea-Air-Space Exposition to showcase new technology. Membership rose steadily and remained more than 70,000 after 1990.

Conclusion

Rarely able to influence legislation on its own, the league regularly provided important publicity and support to pro-navy presidents and congressmen. It generally left policy making to navy leaders and proved unable to challenge the navy's civilian leaders. Often, it has served as an unofficial public relations agency for the navy, achieving its greatest success when aligned with sympathetic presidents and powerful congressional allies.

NAVY NURSE CORPS

In 1908, the U.S. Congress passed a bill creating the Nurse Corps (female) of the U.S. Navy. In the 19th century, male enlisted men, called loblolly boys, had

assisted navy medical officers, but in 1861, the title and rating became "nurse." This entry discusses the history of the Navy Nurse Corps, with a focus on its growth, milestones, and leaders.

Early History

During the U.S. Civil War, five African American women served as nurses along with male nurses and nuns of the Holy Cross School of Nursing on the *Red Rover*, a paddle-wheel steamer designated as the navy's first hospital ship. Before being taken out of service in 1865, the *Red Rover* cared for 2,947 sick and wounded men along the Mississippi River.

Although not enlisted in the navy, trained female nurses served patients at the Naval Hospital, Norfolk, during the Spanish-American War of 1898, and other female contract nurses employed by the navy worked at the Naval Hospital Brooklyn, and at Key West, Florida. The navy also purchased the hospital ship *Solace*, which made several trips to Cuba with medical personnel including eight trained nurses from Mills School of Nursing in New York. When the Spanish-American War ended, the Navy Medical Department established the U.S. Navy Hospital Corps and began employing trained nurses in all of its hospitals.

To provide a corps of skilled navy nurses, in 1908, Congress created the Nurse Corps (female) to consist of one superintendent, to be appointed by the secretary of the navy, and of as many chief nurses, nurses, and reserve nurses as needed. Esther Voorhees Hasson, a former army contract nurse, became the Navy Nurse Corps' first superintendent and set high standards for the first 20 women selected for the new nurse corps. Known as "The Sacred Twenty," these women met and overcame the numerous challenges of being accepted in the male world of navy medicine.

In 1911, Lenah Sutcliffe Higbee became the second superintendent and guided a nurse corps then totaling 86 women on duty in hospitals in Washington, D.C.; Philadelphia, Pennsylvania; Norfolk, Virginia; Annapolis, Maryland; Brooklyn, New York; Mare Island, California; Canacao, Philippine Islands; and Guam. Navy nurses served briefly in 1913 on the presidential yacht *Mayflower* and cruiser *Dolphin*.

Expanding Role: World Wars I and II

By the time the United States entered World War I, the Navy Nurse Corps had increased to 160 nurses.

To support the war effort, the navy appointed reserve nurses who worked alongside regular navy nurses in hospitals and clinics and trained enlisted medical personnel.

In September 1917, the first navy nurses to serve overseas sailed from the Brooklyn Hospital Unit to Brest, France, on the USS *Henderson*. The navy also deployed nurses to base hospital units in Scotland and Ireland, and navy operating teams, including nurses, cared for casualties near the combat front lines. At home, navy nurses tended patients and trained hospital corpsmen at 25 naval hospitals. A total of 1,551 navy nurses served in navy hospitals and on hospital ships during the war. Eleven regular navy nurses and eight reserve nurses died on active duty during the war, over half from influenza. Four, including Superintendent Higbee, received the Navy Cross for their wartime service.

During the interwar period, the Navy Nurse Corps decreased in size to 335 nurses, but they remained an important part of navy medicine. Navy nurses were stationed not only in hospitals in the United States but also in the Virgin Islands, Guam, Samoa, and on the hospital ship *Relief*.

Although some graduate African American nurses inquired about being appointed navy nurses, none were accepted until early 1945 when both the Army and the Navy Nurse Corps opened their ranks to Black nurses.

On the eve of the Second World War, Chief Nurse Sue S. Dauser became the fifth superintendent of the Navy Nurse Corps, then numbering 787 nurses. When World War II began, 95 navy nurses were serving at overseas bases and on hospital ships, the majority in the Pacific. The navy had 31 nurses on staff at the Pearl Harbor Naval Hospital, on the USS *Solace*, and deployed to the Philippine Islands. Eleven navy nurses led by Lieutenant Commander Laura M. Cobb were taken prisoner when Manila surrendered to the Japanese. Five other nurses serving on Guam also fell prisoner to the Japanese.

The nurse corps expanded rapidly to meet the needs of a global war assisted by the new Cadet Nursing Program. In early 1945, navy nurses trained in air evacuation began duties as flight nurses, and at the end of June 1945, the corps had 11,086 nurses on active duty serving at 40 hospitals, 6 hospital corps schools, and 176 dispensaries in the United States and on board 12 hospital ships. During World War II, the navy assigned nurses to units in

Africa, Alaska, the Aleutian Islands, the Admiralty Islands, Italy, the Marianas, New Caledonia, Newfoundland, Australia, New Zealand, Bermuda, the Canal Zone, Cuba, England, Hawaii, the New Hebrides, Puerto Rico, the Russell and Solomon Islands, and Trinidad. Although no navy nurses were killed in combat, 37 navy nurses lost their lives during the war.

Increasing Status: After World War II to the Vietnam War

In 1946, many navy nurses were demobilized, but others continued on duty overseas. That summer nine navy nurses joined other medical personnel on the island of Kwajalein to support servicemen and scientists deployed to Bikini Atoll as part of Operation Crossroads, the first postwar atom bomb tests.

A year later, Congress passed a law making the Navy Nurse Corps a staff corps of the navy with permanent rank. Now considered navy officers, the nurses received a new insignia, and in May, Secretary of the Navy James Forrestal appointed Nellie Jane DeWitt the first director of the new Navy Nurse Corps with the rank of captain.

Postwar reduction in personnel left the Navy Nurse Corps with only 1,950 women on active duty when the Korean conflict began. The need for more nurses resulted in the recall of experienced reserve nurses to active duty.

Three hospital ships, *Repose*, *Haven*, and *Constellation*, were deployed to Korean waters, but many battlefield casualties went to the former Yokosuka, Japan, Naval Dispensary, now a Naval Hospital with a full medical staff including 200 navy nurses. Navy nurses also served on board ships of the Military Sea Transportation Service carrying troops to Korea and casualties back to the United States. By July 1951, 3,328 navy nurses were serving on board three hospital ships, 29 navy hospitals, 78 station hospitals and dispensaries, and four Hospital Corps schools. Two years later, a truce ended the conflict in Korea during which navy nurses had served with distinction. Three received the Navy Bronze Star and six a Commendation medal.

Navy hospital ships continued to ply the Pacific following the Korean conflict. In September 1954, following the French defeat at Dien Bien Phu, the USS *Haven* embarked more than 700 French

patients in Saigon, French Indochina. At home, in 1961, the first navy nurse graduated from the Naval Postgraduate School at Monterey, California, with a master of science degree, and others soon followed.

When the United States committed additional military advisers to Vietnam in 1963, the navy assigned two nurses to assist medical personnel at a former army dispensary clinic in Saigon. Before the U.S. Naval Station Hospital, Saigon, returned to the army in March 1966, a total of 20 navy nurses had served there caring for casualties from the Vietnam conflict. Nurses then transferred elsewhere, including a new Naval Hospital at Da Nang, Vietnam, and the hospital ships *Sanctuary* and *Repose*. Navy nurses also provided medical care for casualties, as well as the dependent wives and children of naval personnel, on Military Sea Transport Service ships and in navy hospitals in Yokosuka, Japan, on Guam, and back in the United States.

In a milestone for navy nursing, in 1964 the secretary of the navy approved a change in the requirements for a commission in the Navy Nurse Corps allowing male nurses to join the all-female corps. George M. Silver was the first male nurse, commissioned as an ensign in August 1965. Although not at its authorized strength, by the end of 1967, the Navy Nurse Corps had grown to 2,453 officers.

When Vietcong forces launched the Tet Offensive in 1968, the Navy Hospital at Da Nang, Vietnam, Chief Nurse Mary Cameron recalled, received a tremendous number of casualties. They cared for a total of 24,000 patients in 1968, including a large number of malaria cases and prisoners of war.

The unpopularity of the war and a nursing shortage challenged the Navy Nurse Corps's leadership, but by early 1973, the last navy combat forces left Vietnam.

In April 1972, Navy Nurse Corps Director Captain Alene Durek became the first woman flag officer in the navy and in June received the star insignia of rear admiral. Nurses under her command served all over the world, including a new medical facility in Athens, Greece, in Sardinia, Asmara, Ethiopia, and on the USS *Sanctuary*. Women in the navy continued to make history. In 1975, Commander Julia O. Barnes became the first black navy nurse to receive assignment as a director of nursing services at the hospital in Guam. Three years later, the navy selected Commander Joan Bynum as the first African American woman to hold the

rank of captain, and in 1983, Captain Mary F. Hall became the first nurse to command a naval hospital, the Naval Hospital, Guantanamo Bay.

Middle East Wars and Humanitarian Missions

After almost two decades of peace, in 1990, the Navy Nurse Corps was again called on to support American forces overseas when a coalition of over 30 nations resolved to defend Kuwait and Saudi Arabia against Iraqi aggression. Over the next 5 months, in Operation Desert Shield, 200 ships brought troops and equipment to Saudi Arabia. In mid-January 1991, to support Operation Desert Storm, the navy deployed navy nurses and medical personnel to the Gulf of Arabia on two hospital ships, USNS *Mercy* and USNS *Comfort*, the latter admitting more than 700 patients.

Navy nurses participated in humanitarian missions as well. At the Naval Hospital, Guantanamo Bay, Cuba, in 1991, they participated in Operation Safe Harbor, caring for Haitian immigrants on board U.S. Coast Guard cutters and navy ships and at a camp ashore. After the September 11, 2001, terrorist attacks, the navy activated and sent the USNS *Comfort* to New York City where the ship provided sleeping quarters, meals, laundry service, and medical treatment to relief workers. *Comfort* also assisted relief efforts after Hurricane Katrina in 2005. These relief efforts have enabled the corps to determine the critical skills needed by navy nurses in wartime. According to Rear Admiral Nancy Lescavage, RN, NNC director, this led to the development of a plan to increase the numbers of nurses in anesthesia, OR (operating room), critical care, ER (emergency room), trauma, basic medical/surgical, and mental health care.

Once again called to the Middle East, in 2003, the Navy Nurse Corps deployed 600 active-duty nurses and activated approximately 400 reserve nurses in support of Operation Iraqi Freedom. They served at fleet hospitals, with U.S. Marines in Fallujah, and on the USNS *Comfort*, which received large numbers of casualties in 2003, most of them Iraqi civilians and enemy prisoners.

Following the December 2006 tsunamis and magnitude 9 earthquake in the Indian Ocean, the navy sent medical teams with the USS *Bonhomme Richard*, USS *Abraham Lincoln*, Carrier Wing Two, and USNS *Mercy* to assist in disaster relief efforts.

By March 2009, the navy had deployed a total of 2,606 medical personnel and nurses to Afghanistan in support of Operation Enduring Freedom. One of these navy nurses, 35-year-old Lieutenant Florence Choe, who volunteered to work as a mentor in the Afghan National Army, was gunned down and killed during an insurgent attack. Over the past decade, navy physicians, nurses, dentists, and corpsmen have seen duty in Cambodia, Sri Lanka, Djibouti, Baghdad, and Zambia to conduct HIV/AIDS research, Ghana for humanitarian support missions, and to Vietnam, Laos, and Cambodia with the Joint POW/MIA Accounting Command.

Navy Nurse Corps Today

On May 13, 2008, the Navy Nurse Corps celebrated 100 years of dedicated service. Today, nurses continue to serve in navy hospitals in the United States and abroad in Guam; Yokosuka, Japan; Okinawa; Italy; and Spain. Navy nurses can focus on more than a dozen practice areas including critical care, emergency trauma, maternal/infant care, anesthesia, pediatric, psychiatric, and medical/surgical. And, although most navy nurses today are not deployed on ships at sea, every U.S. Navy aircraft carrier and some larger ships have one nurse on staff. From that small group of 20 women in 1908, the Navy Nurse Corps has grown to 2,274 active-duty and 1,249 reserve nurses and become an invaluable part of the U.S. Navy.

NEOCONSERVATIVES

New Conservatives (also *neoconservatives* or *neo-cons*) is a term that entered the American political discourse in the early 1970s to describe Americans who had moved from the left toward the right on the political spectrum. Often referred to as “a liberal who got mugged,” the term was coined by Michael Harrington and the editors of *Dissent* magazine to describe this shift in American political thought. Harrington was a social democrat. He chose this term to draw a contrast between his views and the views of his former comrades. His choice of words targeted those former socialists and communists who had defected; however, there were also traditional liberals who moved to the right. This entry discusses the principles and criticisms of neoconservatism, prominent neoconservatives, and the role of neoconservatism in U.S. foreign policy and in the post-9/11 world.

The inspiration for the neoconservative movement comes from Leo Strauss and Alan Bloom. Some of the early figures to be labeled as neoconservatives were Irving Kristol, Daniel Patrick Moynihan, Daniel Bell, Michael Novak, and Peter Berger. Kristol was the first to accept the label of neoconservative. He is known as the godfather of neoconservatism. The neoconservatives were disenchanted with the direction in which the United States was heading. The turbulence of the 1960s demonstrated to these men that the liberal and socialists agenda set forth for the “Great Society” was flawed.

Neoconservatives disapproved of the unequal treatment of racial minorities, women, and the poor. However, they were not content with the approach espoused by liberals and democratic socialists to address these challenges. The neoconservatives recognized the need for a limited welfare state but believed that the “nanny state” that emerged out of the Great Depression was detrimental to the collective good of society.

Neoconservatism emerged following the turbulence of the 1960s, gained significant power among the ruling elite during the 1970s, and dominated the

Reagan era in the 1980s. During the 1990s, neo-conservatives rejected the realist foreign policy of President George H. W. Bush as well as the humanitarian interventionism espoused by President Bill Clinton. Neoconservatives reemerged at the forefront of foreign policy decision making following the terrorist attacks of September 11, 2001.

General Principles of Neoconservatism

Neoconservatives do not have a manifesto or published tenets that clearly define their political platform. Neoconservatism is a political movement that continues to evolve. However, there are some general principles associated with neoconservatism that have remained more or less constant.

1. Neoconservatives believe that the “Great Society” is a “nanny state” that is detrimental to the collective good of society.
2. Neoconservatives generally support laissez-faire economics and free markets. Free markets are the best mechanism for the distribution of resources. However, they do not believe that the market will solve every problem.
3. Neoconservatives have a respect for religion and family. The 1960s counter culture was viewed as an affront to the establishment of an orderly and moral society.
4. Neoconservatives do not shy away from intervention when it comes to foreign policy. They believe that threats to democracy exist in the world, and they must be confronted. The survival of democracy depends on this approach.

Neoconservatives and American Foreign Policy

The end of the Cold War brought about a shift in the structure of the international system. A debate ensued regarding American foreign policy. The administration of George H. W. Bush was dominated by conservatives who believed that the United States should pursue a realist foreign policy—that is, the United States should avoid intervention in conflicts except in cases where American national interests are at stake.

The Clinton administration was composed of liberal humanitarians. Liberal humanitarians believe in the ideals set forth by President Woodrow

Wilson regarding democracy promotion and human rights. Liberal humanitarians believe that American power should be used to intervene in war-torn areas throughout the world to promote human rights.

Neoconservatives in the 1990s rejected both of these approaches. Consistent with the tradition of supporting intervention, most neoconservatives believed that the United States should use its power abroad to promote democracy. However, the rationale behind American intervention was not based on humanitarian grounds or a desire to spread democracy just to spread democracy. Rather the neoconservatives argued that democracy promotion was the best way to maintain American’s position as the world superpower.

Additionally, neoconservatives are ambivalent toward international organizations. In their view, the effectiveness of international organizations is limited. Unilateralism is the best approach to safeguard American interests. Some of the figures who supported this approach to foreign policy are William Kristol, Robert Kagan, Charles Krauthammer, Lawrence Kaplan, and Richard Perle.

Neoconservatives in the Post-9/11 World

During the 2000 presidential campaign, George W. Bush advocated a realist approach to foreign policy. In his view, the peacekeeping operations and humanitarian interventions conducted under the watch of Clinton degraded the capabilities of the U.S. military to prepare for higher intensity conventional conflicts. National Security Advisor Condoleezza Rice once stated, “Carrying out civil administration and police functions is simply going to degrade the American capability to do the things America has to do. We don’t need to have the 82nd Airborne escorting kids to kindergarten” (quoted in Gordon, 2000, p. 1A).

In the aftermath of the terrorist attacks of September 11, 2001, George W. Bush reevaluated this approach. The United States was attacked on its own soil and was caught off guard. The attacks were unprecedented. George W. Bush found the position of the neoconservatives to be a rational approach in this new era of strategic uncertainty. American security and democracy faced a new threat from terrorist groups such as al Qaeda. The neoconservative position of using force to protect the United States came to dominate the debate regarding American foreign policy.

The United States acted immediately following the attacks of 9/11 and defeated the Taliban regime in Afghanistan. The Taliban had harbored al Qaeda, and the sanctuary in Afghanistan had been used to plan the attacks of 9/11. The United States now recognized that failed states and rogue regimes provided a direct threat to national security. The neoconservative approach to foreign policy provided a rational prescription to deal with this threat. After 9/11, George W. Bush was determined to take the initiative and go on the offensive against America's enemies in order to thwart future attacks.

Once the Taliban were defeated, George W. Bush and the neoconservatives assessed the threats from rouge states such as Iraq, Iran, and North Korea. The fear was that weapons of mass destruction (WMD) developed or possessed by these states would be sold or given to terrorist groups such as al Qaeda. The category of WMD includes nuclear, biological, and chemical weapons. George W. Bush and his team of policymakers determined that Iraq posed the greatest threat of these three states. The neoconservatives proposed the use of military force to eliminate the threat from Saddam Hussein's alleged nuclear arsenal. The most vocal of these individuals was Perle. Perle had connections to Ahmed Chalabi, who at the time was a leader in the umbrella Iraqi opposition group the Iraqi National Congress.

The debate leading up to the Iraq War in 2003 was contentious as many liberals and a good portion of the international community opposed the use of force by the United States. However, the neoconservatives who advised George W. Bush favored intervention to secure America. American security was more important than placating the international community. Some argued that the neoconservatives hijacked the debate and pushed George W. Bush to opt for war. Either way, George W. Bush's neoconservative approach to foreign policy came to be known as the Bush Doctrine.

Neoconservative architects of the Bush Doctrine included Dick Cheney, Donald Rumsfeld, and Paul Wolfowitz. These men were unabashed supporters of the use of American force to further American interests. Key aspects of the Bush Doctrine are preemption, unilateralism and regime change, and strengthening of military capabilities. The Iraq War in 2003 was the first case in which the Bush

Doctrine was applied. The United States attacked Iraq to preempt future catastrophic attacks that might originate from Saddam Hussein's WMD program. The plan was for the United States to use minimal military force to decapitate the Hussein regime. Support from the international community was not required to justify this undertaking.

The insurgency in Iraq that followed America's swift defeat of the Hussein regime called into question the neoconservative approach and the Bush Doctrine. Saddam Hussein did not possess any WMDs. Accordingly, opponents of the Bush Doctrine questioned the legality of preemption. The force the United States used in Iraq was not enough to secure and stabilize the country following the initial invasion. The initial failure in Iraq raised doubts about the ability of the military to impose America's will abroad. Last, some have argued that the United States squandered the support from the international community that followed 9/11. Critics argue that the United States alienated the international community by disregarding their opposition to the war.

Critics of the Neoconservative Movement

The fallout from the Iraq War gave greater voice to critics of the neoconservative movement such as Shadia Drury and Anne Norton. Drury and Norton analyze the evolution of the neoconservative movement from its origins in the ideas of Strauss. They argue that Strauss was opposed to liberalism and democracy, and the neoconservatives have twisted his ideas to conceal this fact. They assert that the neoconservative movement is part of a conspiracy by a few to use the American political system to secure power and wealth.

The neoconservative movement has also had some prominent members break ranks and criticize the movement. Michael Lind began criticizing the neoconservative movement in 1996 when he argued that the Republican Party had been hijacked by southern Republicans who sought to use culture wars to shift the tax burden from the wealthy to the middle class. Francis Fukuyama initially supported the Iraq War but broke ranks with the movement because he felt that the neoconservative approach to Middle East democratization and foreign policy was a violation of neoconservative tenets.

NICARAGUA INTERVENTION (1920s)

The United States has a long history of intervening in the affairs of Nicaragua. During the 19th century, an American filibuster, William Walker, seized control of the nation for several years before being overthrown. The U.S. government's interest in Nicaragua emerged in the early 20th century to protect the Panama Canal. The U.S. Marines intervened from 1909 to 1910 and from 1912 to 1925 to install and maintain a regime favorable to the United States. Under the 1916 Bryan-Chamorro Treaty, the United States gained exclusive rights to build a canal through this Central American nation in return for

\$3 million in foreign aid. The final intervention had several legacies, most notably, installing a regime that survived into the 1970s and fostered a major symbol of leftist nationalism in the Nicaraguan nation, Augusto Sandino. This entry discusses the history of the U.S. intervention in Nicaragua from 1926 to 1933.

Background

The United States landed marines and naval personnel in Nicaragua in May 1926, in a deployment that lasted until January 1933. The intervention expanded from its original mission of protecting persons and property of Americans and other foreign citizens to thwarting what appeared to be a significant threat of Mexico establishing a bloc of revolutionary states in Central America antithetical to U.S. interests. The threat arose from a civil war caused by an ultra-conservative coup led by Emiliano Chamorro Vargas against the Conservative-Liberal coalition government of the Conservative president Carlos Solózano and the Liberal vice president Dr. Juan Sacasa. The State Department's position was not to recognize the coup. Henry L. Stimson negotiated a settlement in 1927 agreed to by all except the Liberal general Sandino. He fought a guerrilla war against U.S. forces until they withdrew.

A Turning Point in Asymmetric Warfare

Partisans under General Emiliano Chamorro, who had been president of Nicaragua from 1917 to 1921, seized Loma Fortress in 1925, giving them military control of Managua and forcing the resignation of Solózano. He fled the country along with Sacasa. Chamorro removed the Liberal members of Congress, with the remaining representatives naming him president in January 1926. The United States made clear that it would not recognize his government. A Liberal group began an uprising along the east coast, which was defeated by the government forces. The fighting threatened American property, hence the landing of U.S. Marines at Bluefields, Nicaragua, in May 1926. They withdrew in June after the danger subsided but redeployed on August 27, 1926, when General José Moncada's troops rebelled in the east in support of the exiled Sacasa. This uprising spread across the nation, including General Anastasio Somoza's force in the southwest part of the nation.

The intervention expanded from protection of property interests to a broader political one after Mexico announced support for Sacasa's claim to the presidency. The United States did not want a Sacasa government friendly to Mexico to take power. The shipment of Mexican arms to Moncada lent substance to such concerns. The new imperative for the intervention was to assert U.S. supremacy in Central America. The goal was for a negotiated end to the civil war and the establishment of a provisional government led by neither Chamorro nor Sacasa. American-sponsored negotiations in October 1926 succeeded only in convincing Chamorro to resign when it became clear that he could not secure American support. Several Liberal members of Congress returned, and the reconstituted body elected Adolfo Díaz as the president, who was recognized by the United States.

Sacasa continued his claim. He named Moncada Minister of War, who then won several battles in the east. It became clear that Díaz would fall if the United States did not take further action. Faced with letting Díaz fall or initiating combat against Liberal forces, President Calvin Coolidge elected instead to send New York lawyer and the former secretary of war Henry Stimson in April 1927 to negotiate.

Stimson won Conservative support for a plan wherein Díaz would continue as president with posts given to Liberals. An amnesty would exist for combatants who surrendered arms to American forces. A nonpartisan National Guard under American command would replace the politicized Nicaraguan constabulary. The marines in Nicaragua would be part of a brigade-strength deployment to enforce the settlement. Liberal forces agreed to the terms because of the American force. The lone significant Liberal holdout was Sandino, who declared his opposition on May 12, 1927.

Only 30 of Sandino's men stayed with him. Eventually, guerrilla successes, along with frictions caused by American forces, caused Sandino's numbers to swell to hundreds of full-time effectives, hundreds of part-time partisans, and thousands of supporters. Civilian deaths from bombing and general occupation friction contributed to anti-American sentiment.

General Logan Feland received the posting of military commander of the marine deployment on March 7, 1927, where he served until he was relieved in March 1929 by General Dion Williams. Marine

deployment varied from a low of 1,500 in late 1931 to a high of 2,800 in June 1927. Guerrilla tactics and marine force limitations restricted almost all the fighting to small unit action involving U.S. forces less than a 100 against guerrilla forces that varied from equal to somewhat larger than the U.S. forces.

The first battle between Sandino's men and the marines occurred at Ocotal on July 16, 1927. Sandino carried out a frontal attack using 60 well-armed guerrillas and hundreds of peasants with machetes, on the 39-man marine and 48-man National Guard garrisons in the town beginning about 1:00 a.m. Both sides were equipped with rifles, automatic weapons, explosives, and machine guns. The marines were supported by a two-plane morning communications flight, including strafing and a five-plane afternoon bombing run. Sandino's forces lost the chance for surprise when a sentry detected movement at 1:15 a.m. The garrisons, with U.S. air support, inflicted heavy casualties on the guerrillas. Despite attacking with courage, the undisciplined guerrillas were only able to inflict marine casualties of one dead and one wounded. Sandino took the lessons of the battle to heart, deciding to never again try to fight the marines toe to toe or in any fashion that exposed his forces to decisive air action.

Subsequent battles usually involved ambushes, or attempted ambushes prematurely detected by U.S. forces, that involved brief or desperate firefights depending on whether American forces were pinned down or not. Only rarely did Sandino's subordinates attempt attacks on defended positions. Marine attempts to send large patrols into the countryside to deal with Sandino usually failed due to uneven intelligence on the American side as against excellent intelligence of American movements and the limitation that American patrols broke pursuit to return to base once they suffered any casualties. The stalemate favored the insurgents as the United States eventually committed to a withdrawal once elections had been carried out in 1932, having promised to turn the conflict over to the Nicaraguan government and its American-trained National Guard.

Intervention for Protection of Persons, Property, and National Security

The United States often intervened in the Western Hemisphere on announced missions of protecting American lives and property. It also intervened,

sometimes explicitly, on missions of national security or even commercial interest. The original deployment occurred in Nicaragua under the guise of protecting lives and property. It evolved into one of national security with a backdrop of commercial interest. Sandino presented a challenge on all these fronts. While he was circumspect about killing American civilians, he targeted American business interests, property, and military personnel. His capture of the La Luz and Los Angeles Mining Company mines proved that the marines were incapable of protecting American property at the troop levels employed. The fact that most foreign property damage and lives lost occurred after the intervention illustrates this point. National security concern about a leftist Mexico leading a Pan-American revolutionary movement eclipsed a merely protective mission when indications were that a Sacasa government could overthrow Díaz. Thus, Washington decided to militarily support him, turning the intervention into one supporting American hegemony.

While the political aspects of the Nicaraguan intervention fit the pattern of U.S. involvements, the conflict involved several novel features that had effect on subsequent insurgencies. The factors that gave rise to the changing nature of the tactics employed were the advent of air power in counterinsurgency and the reaction of the insurgents to it. Fast-moving insurgents, often cavalry, had long been able to mass at a point of numerical advantage, achieve surprise, and carry out missions and then withdraw into terrain that inhibited successful pursuit. The use of planes changed those tactics in Nicaragua, exposing massed insurgents to aerial bombardment and successful aerial reconnaissance. The replacement of the antiquated DeHavillands in 1928 increased aerial damage—inflicting potential as the new Vaught Corsair bombers increased bomb loads from 4 to 10 per plane, and five-gun, four-forward-firing, Curtiss Falcon dive bombers increased gun capacity by three. The dive bomb attack by Marine aviators on July 16, 1927, at Ocotal predated German dive bombing at the outbreak of World War II by over a decade. Aerial resupply and extraction of wounded also presaged its heavy use in future conflicts. Sandino adjusted by constantly moving, eschewing massing, restricting operations to shorter range from his camp, ordering cessation of mounted travel, and encouraging night travel.

The innovations listed above, in combination with his decision to never again try to fight a standup battle after Ocotal, or under any conditions that did not favor his men, allowed Sandino to survive successfully. Nevertheless, the failure to keep the National Guard apolitical gave its commander, Somoza, the means to achieve a dictatorship that killed Sandino after he had ceased hostilities following the American withdrawal and that closely aligned itself with the United States.

9/11 (2001)

Al Qaeda conceived of its September 11, 2001, attacks as blows against the American economy and the U.S. government. The sequenced strikes were aimed to kill victims on four commercial airliners, at New York City's World Trade Center (WTC), and in the U.S. Department of Defense's Pentagon headquarters in Arlington County, Virginia. To succeed, they exploited aviation security weaknesses—speed and surprise—capitalizing on lethality and media coverage. The hijacking of four jets, piloted as suicidal cruise missiles, allowed the planners and their subordinates to create the maximum physical and psychological impact. The result was the most deadly set of terrorist attacks in history. The 19 hijackers destroyed the pair of office buildings at the globe's financial heart, damaged the U.S. military headquarters, and killed 2,977—all civilians save for 60 police officers, 55 uniformed military personnel, 10 paramedics, and 341 firefighters—in less than 2 hours. This entry describes the techniques used

by the hijackers to take control of four passenger jets and carry out the attacks.

To capture the civilian airliners, the terrorists needed to bring enough force on board each jet to gain and keep control of it. Based on fragmentary reports, 15 attackers exclusively launched the hijackings, using either martial arts skills or weapons (mace, sharp knives, and tools) to injure and threaten passengers or cabin crew and compel pilots to turn over control of the airplanes. Before 9/11, such improvised weapons could be brought within the airport security network. In the hands of the hijackers, this level of force intimidated flight crews, who believed that their safest course was compliance when confronting a demand to surrender control of the airplane. This new method allowed the remaining 4 hijackers to begin flying the airliners, each loaded with a large amount of fuel.

Also important to the attacks' success was their speed and synchronization. The time between the first jet taking off (American Airlines Flight 11) and its impact into the North Tower of the WTC amounted to just 47 minutes. In that period, the plane flew west from Boston, was hijacked over New York State, rerouted southward, and crashed, all without explicit warning to civil aviation or military authorities. Seventeen minutes after Flight 11's destruction, United Airlines Flight 175 hit the WTC South Tower, while American Airlines Flight 77 and United Airlines Flight 93, respectively, crashed in northern Virginia and Somerset County, Pennsylvania, 35 and 60 minutes thereafter, respectively. The compressed sequence of events, using fast-moving jets flying without transponders and no announced demands to alert authorities, allowed three of four attacks to hit high-profile targets. Only on United Flight 93 did passengers receive enough warning to act in time, by cellular telephone calls. Their resulting self-sacrifice prevented the destruction of another, unspecified ground objective by forcing the airliner to crash in an empty field.

The 9/11 attacks were singular for their extensive destruction, rooted in a pair of causes: (1) airliners' speed and (2) fuel capacity. Two of the three jets in New York and Arlington struck buildings at speeds in excess of 500 miles per hour (800 kilometers per hour); all held more than 15 tons of fuel on impact. The high kinetic energy from their speed meant the airplanes created tremendous impact damage while spilling large amounts of fuel to start extensive fires.

Hundreds of occupants perished at the instant of those crashes, but the damage also developed after the impacts due to fire. While reconstructing the exact cause of events inside the WTC is necessarily difficult, these infernos fundamentally undermined the 110-story structures, leading to the collapse of the two 500,000-ton office buildings, each killing many hundreds more. A similar, if much smaller scale, structural collapse also took place at the Pentagon.

Strikes at American targets not only inflicted severe if localized damage but also had important information warfare objectives. By targeting the WTC in sequence, an organizational trademark method, al Qaeda operatives ensured that the impact of the second airliner would be televised for stunned millions to see. Reports of subsequent crashes in Virginia and Pennsylvania built the impression of a seemingly unstoppable storm of attacks with authorities powerless to resist. Fostering the impression of American defenselessness was certainly key to al Qaeda's psychological objectives. As with most terrorist attacks, the broader aims potentially included either invoking an impression of U.S. ineffectuality, creating domestic political turmoil, or provoking an aggressive, even self-defeating military response. Physical destruction was more a vehicle to prompt a misstep rather than an end in itself.

As the deadliest terrorist strikes in history, the 9/11 attacks are unique. Their execution exploited key weaknesses, surprise, speed, and publicity to create an impact beyond the physical destruction they wrought. Countering such determined attacks is very difficult indeed and remains an intelligence and law enforcement priority for the foreseeable future.

Final report of the National Commission on Terrorist Attacks Upon the United States. Washington, DC: Government Printing Office.

9/11 ATTACK ON PENTAGON

The September 11, 2001, attack on the Pentagon came as part of the deadliest terrorist strikes in American history. Understandably overshadowed by the larger scale destruction of the World Trade Center's Twin Towers, it remains an important event on its own. With 184 victims killed, the blow at the U.S. military headquarters in northern Virginia is the second most deadly terrorist strike in American history, smaller only than the simultaneous New York City attacks. This entry discusses the events of that day and rescue efforts following the attack. Despite widespread destruction and human toll, with technical and organizational problems amid the wider confusion of 9/11, the emergency response worked as well as could be hoped.

The attack began with the takeover of American Airlines Flight 77. On one of four jets taken between 8:15 and 9:30 a.m., five passengers, Khalid al Mihdhar, Majed Moqed, Nawaf al Hazmi, Salem al Hazmi, and Hani Hanjour, who boarded at Dulles Airport at Washington, D.C., hijacked the Boeing 757 over southern Indiana. Turning the airplane around, one piloted it toward Washington for about 45 minutes. Approaching the capital, the jet flew along the Potomac River at about 7,000 feet altitude, then made a turning descent over northern Virginia, crashing into the southwest face of the Pentagon just after 9:37 a.m. At the time of impact, the 100-ton 757's speed was about 529 miles per hour, or 850 kilometers per hour.

The resulting conflagration proved gruesome, for American Airlines Flight 77 still carried 18 tons of fuel. Survivors nearest the impact point recounted a tremendous fireball inside the Pentagon, channeled by concrete walls and floors. At once an acre of space on each of the two lowest floors became an inferno of wrecked offices and hallways, destroyed furnishings and equipment, fractured electrical wiring and water pipes, trapping, injuring, or killing office workers on all five floors. Dense, acrid smoke obscured survivors' vision and threatened to suffocate them. Inadvertently, the hijackers flew the jet into part of

the Pentagon largely emptied of employees to permit renovations, a piece of good fortune, limiting casualties inside the building to 125 dead and hospitalizing 106 wounded. Roughly 35 minutes after impact, a segment of the Pentagon's outer section collapsed, undermined by the impact and fire.

Most occupants evacuated immediately, although key personnel continued standing watch or strove to keep water and power flowing, while hundreds more tried to find and save those trapped or injured. Lacking orders or equipment, these last few became informal rescue teams using fire extinguishers to knock back the blaze and masks improvised from moistened T-shirts to ward off smoke. Directly confronting the fire, these rescuers saved dozens either trapped or confused by wrecked spaces. After the first half hour, however, their efforts created friction with security and firefighting personnel, with both parties committed to saving victims yet regarding the other as "civilians."

The Pentagon's location next to Washington, D.C., meant that a wealth of first responders helped the injured and fought the fire. Given the blaze's scope, the 600 firefighters, backed by hundreds more paramedics and doctors (some themselves Pentagon workers), as well as police along the roads leading to the headquarters and a U.S. Army engineer company specialized in search and rescue, was appropriate. Still, given the response's scale, complexities arose. Differing jurisdictions' radios could not transmit to one another, several agencies dispatched rescue workers before being asked, ambulances reported to the Pentagon side far from many injured, and personnel withdrew several times on hearing confused reports of another aircraft approaching. While these and the scale of the 280-acre reservation inhibited command and control, none caused further loss of life, although the withdrawal orders prolonged the fire's duration. Existing procedures under the federally sponsored Emergency Response Plan worked well, and by late afternoon September 12, the fire was declared controlled.

The month after the attack saw the Pentagon emptied of rubble, classified documents, criminal evidence, and human remains. Urban search and rescue teams shored up floors to prevent further collapse. The Dover Air Force Base Port Mortuary in Delaware identified all but five airliner and Pentagon victims by December 2001. (The other remains were too damaged to link them to a specific victim.)

Meanwhile, the Department of Defense and other agencies supported the family members of those killed, establishing an assistance center for their financial, legal, and emotional help. The large-scale and comprehensive response limited damage to the headquarters and helped minimize both death and suffering among the injured. While a grievous incident, these responses to the Pentagon attack stand as strong testament to the effectiveness of mixing improvised and preplanned answers to the terrorist-created building fire.

9/11 COMMISSION

On September 11, 2001, two planes flew into the World Trade Center in New York City, and two other planes crashed, one into the Pentagon and another into a deserted field. More Americans died from this disaster than at Pearl Harbor in 1941. The 9/11 Commission was established to investigate the causes of the disaster and to make recommendations for the future to improve American security. These recommendations have influenced and continue to influence American intelligence, foreign policy, and national security. This entry discusses the creation of the commission and its findings and recommendations.

The Members and Mandate of the Commission

When Pearl Harbor was attacked, President Franklin Roosevelt appointed a commission 9 days later to investigate the assault, and the Warren Commission

was created 7 days after John Kennedy was assassinated. But in 2002–2003, Congress and the president took 14 months and 16 days to approve creation of the National Commission on Terrorist Attacks Upon the United States, better known as the 9/11 Commission. Whereas Roosevelt and Lyndon Johnson saw commissions as a way to deflect criticism from their administrations, President George W. Bush and his supporters felt that an inquiry would lead to partisan criticisms of the administration, divert time and attention from the Global War on Terrorism, and help terrorists by publicizing information about American intelligence operations.

Even after centrist Republicans like Senators John McCain and Charles Grassley joined the push for an investigation, the Bush administration resisted efforts to create a commission until the political environment abruptly changed in the spring and summer of 2002. On May 15, CBS News announced that Bush had received an intelligence briefing titled “Bin Laden Determined to Strike in the U.S.,” only 5 weeks before planes crashed into the World Trade Center. Suddenly, conservative commentators like George Will and William Kristol joined the *New York Times* in calls for a national commission. Even more critically, newly organized families of the victims of the 9/11 attacks—wives, husbands, daughters, sons, mothers, fathers, brothers, and sisters—demanded that the government create a blue-ribbon commission to investigate the disaster. Under powerful pressure, Congress finally approved, and the president signed a bill creating the 9/11 Commission on November 27, 2002.

Because the commission was created by Congress, not the president, its membership was largely determined by legislative leaders—four appointed by the Senate and House majority leaders; four, by the minority leaders; a chair, by the president; and a vice chair, by Democratic leaders in Congress. Democrats chose the former Senate majority leader George Mitchell as vice chair, adding the former representative Tim Roemer, the former senator Max Cleland (later replaced by the former senator Bob Kerrey), the former Justice Department member Jamie Gorelick, and attorney Richard Ben-Veniste as members. Bush chose Henry Kissinger as chair, and Republicans in Congress added the former senator Slade Gorton, the former secretary of the navy John Lehman, the former governor James Thompson, and the former Nixon and Reagan counsel Fred Fielding.

Almost immediately, both Kissinger and Mitchell resigned because of requirements that they disclose information about clients of their respective firms.

Democrats next chose the former representative Lee Hamilton as vice chair, and Bush selected Thomas H. Kean, the former governor of New Jersey and current president of Drew University, as chair. The new leaders contributed significantly to the success of the commission. Because of his long experience in the House of Representatives, Hamilton provided gravitas and keen political advice. As a resident of New Jersey, Kean had known several victims of the 9/11 disaster personally and related directly to the organizations representing friends and families of victims. Both men demanded a sharp increase in the funding of the commission from \$3 million to \$12 million, and both aimed to transcend partisan conflicts as much as possible. They acted as cochair; they decided that the final report of the commission should be approved unanimously; they selected an integrated staff, rather than choosing a Republican staff and a Democratic staff; and they opened as many of their meetings as possible to public scrutiny. The result was a commission marked by independence, competence, cooperation, and transparency.

With a deadline to produce a report in 18 (later 20) months, the commission, with Philip Zelickow as executive director, hired and organized a staff of more than 70 lawyers, historians, former government workers, specialists, and others to pursue the documents and interviews that were needed. Nine (later eight) teams of staff members focused on areas Congress mandated for examination: al Qaeda, intelligence, counterterrorism policy, terrorist financing, border security, law enforcement, aviation and transportation security, national response on 9/11, and the emergency response in New York and northern Virginia. Charged with investigating these specific issues, the commission was also tasked with making a full accounting of the causes of the attacks and the American response, while also recommending reforms that would make the nation less vulnerable in the future.

Issues and Controversies

From the beginning, tensions and controversy emerged over access to documents and persons. For instance, the law creating the commission said that it should begin by reviewing information and findings

collected by the recently completed congressional joint inquiry into the attacks, but the report and supporting materials of the committee were classified, leading to months of negotiation with the committee and the White House before the commission gained full access. After 6 months, the commission issued an interim report in the form of a report card, giving grades to 16 federal agencies from which it sought information. Only the State Department was judged fully cooperative. In mid-October 2003, after more problems, the commission, under pressure from families and friends of victims, issued subpoenas to the Federal Aviation Administration and the Defense Department, followed later by a subpoena of the City of New York.

More controversy occurred when the commission insisted on access to the president's daily briefings, which could establish what Bush did and did not know about the possibilities of an attack on the United States. A request for the president's daily briefings was refused; then members considered a subpoena while simultaneously negotiating with the White House. The result was a grand compromise in November 2003, when the administration agreed that two commissioners could see all of the president's daily briefings, two others could see only those that the White House deemed relevant, and the group of four could report on what they read to other members of the commission. In the end, the commission could say that it had seen every document it deemed vital to its investigation.

Trouble also arose over access to people, especially senior officials of the Bush administration. When the commission sought a public interview with Condoleezza Rice, Bush's national security advisor, the administration argued that a public interview violated the principle of separation of powers and the president's need for confidential advice. Ultimately, however, on March 30, 2004, the White House allowed her to testify, a decision that actually aided the president's hopes for reelection. One week earlier, Richard Clarke, the national coordinator for counterterrorism, stunned the nation by apologizing for the failures of government. Rice was able to rebut forcefully, strengthening the president's cause. A final struggle over access occurred when the commission sought to interview Bush. At first, the president would only meet with Kean and Hamilton, but later he agreed to meet with the full commission so long as Vice President Dick Cheney was also present

and the commission did not record the meeting. The result was a cordial 3-hour interview.

The Commission's Findings

Finally, in July 2004, the commission completed its investigation, examining approximately 2.5 million pages of documents, interviewing more than 1,200 witnesses in 10 countries, conducting 12 public hearings, and publishing 19 staff reports on specific issues. Never before had such a commission penetrated so deeply into the secret world of intelligence and classified information. On July 22, a 567-page final report was published. Written in a clear, readable style, the report described the planning and operation of the attacks, analyzed the American government's approach to terrorism and conduct during the emergency, and made recommendations for the future that were approved by all 10 commissioners.

The findings of the commission were devastating. No one—the Clinton or Bush administrations, the Central Intelligence Agency, the Federal Bureau of Investigation, the State Department, or Congress—was prepared to deal with the threat of terrorism. A central failure was of integration and focus. Typical was the finding that the Federal Bureau of Investigation had officially adopted a policy of concentrating on counterterrorism in 1998, but in 2001, only 6% of its workforce focused on terrorism. Similarly, several congressional committees oversaw counterterrorism efforts, which meant that no one committee was accountable. The commission issued 41 recommendations, most of which had been made by earlier investigative bodies. In an unprecedented move, money was raised from private sources to finance 16 months of effort by the commissioners and a small staff to enact the recommendations.

Effects of the Commission

The report became a popular best seller and generated intense debate. Media reception was mostly positive. Representatives of the families and friends of the victims hailed most recommendations. Democratic presidential candidate John Kerry called for quick action, and Bush praised the report. Despite the attention, though, results were mixed. Six months after the report was issued, the commission graded the government's response; over half of the grades were C, D, or F. Progress was achieved, for instance, against terrorist financing, but little achievement was made

in declassifying the intelligence budget. Typical was the major piece of reform legislation, the Intelligence Reform and Terrorism Prevention Act, which was passed by Congress in December 2004. The new law created a director of national intelligence, but because of strong lobbying from the Defense Department and tepid support from the White House, the bill did not give the new director of national intelligence control over budgets and personnel throughout the whole intelligence community.

As of 2012, Kean and Hamilton still believed that progress on the recommendations was uneven. Change is difficult. Preventing terrorist access to weapons of mass destruction, taking oversight of intelligence away from several committees in Congress and assigning it to only one, developing more effective policies toward Pakistan and Afghanistan, and staffing and organizing new institutions like the National Counterterrorism Center or the Civil Liberties Oversight Board—none of this is easy. The Central Intelligence Agency and the Federal Bureau of Investigation have made strenuous efforts to focus more effectively on terrorism, but success has been limited by cultural inertia and the difficulties of transitioning away from Cold War patterns of behavior. Perhaps what is most remarkable about the 9/11 Commission is that the report is still vital 8 years after it was introduced. Usually, the reports of federal commissions are assigned space on forgotten shelves in some library within a year or two of publication, but the Department of Homeland Security continues to introduce reforms recommended by the commission, and the media remind us that the commission's recommendation to provide a broadcast spectrum that will allow police and fire departments to communicate with each other has still not been implemented. Surprisingly, the commission continues to influence policy.

NONCOMMISSIONED OFFICER ACADEMIES

Education in the military has traditionally been the purview of officers. France has its academy at St. Cyr; the British officers have traditionally attended the Royal Military Academy, now known as Sandhurst, while their American counterparts have received their formal education and training at West Point. However, modern warfare has dictated that even down to the lowest levels of military leadership, education has become an increasingly important factor in the professionalization of the Noncommissioned Officer (NCO) Corps and its ability to train and motivate others to carry out their roles in combat. In the U.S. Army, there have been two key factors that have contributed to the professionalization of the NCO Corps. The first is the maintenance of an NCO's rank while he or she moves to various duty stations throughout his or her career, and the second is the ability of an NCO to obtain standardized training and education that will be relevant wherever an NCO serves his or her country. In the early years of the U.S. Army, there was neither. This entry discusses the evolution of NCO training in the U.S. military, with a focus on U.S. Army NCO academies and programs.

Early History

The American Civil War propelled a small and technologically backward army into the modern warfare techniques of the 19th century. The advent of the telegraph and railroad, along with the development of weaponry such as rifled canon and repeat-

ing rifles, created the need for technically competent NCOs to supplement the officer corps. However, after the war, the military once again fell to the backwater of America's priorities, relegated to keeping the frontier secure from the only danger posed to the United States at that time—the Indians. Additionally, the military was forced to compete with the civilian sector for individuals with skills in critical fields. The military was also at a disadvantage because the pay that it was able to offer was generally not commensurate with its civilian counterparts. In 1878, Major General Emory Upton expressed his concern about the inadequate training the army provided its NCOs in his treatise *The Armies of Asia and Europe*.

However, there was at least a modicum of training provided by the U.S. Army to its NCOs during the second half of the 19th century. Commencing in 1857, medical NCOs received training at Fort Monroe, Virginia. Starting in the 1870s, engineer NCOs were taught skills at Fort Totten, New York, while the Infantry School of Application was located at Jefferson Barracks, Missouri, and the Cavalry School of Application was located in Carlisle Barracks, Pennsylvania. The unfortunate part was that tradition took precedence over keeping up with progress being made in various fields.

Much of the initial success of the German army during the First World War can be attributed to the education that was provided to its NCOs. The creation of national compulsory service stimulated the need for a strong NCO corps. Special courses were made available to these individuals to advance through their military careers. They were presented with instruction on a variety of topics such as geography, languages, and mathematics, which not only fostered their military careers but also were invaluable in civilian life. This was entirely lost on their adversaries such as the United States.

On entering the First World War, the United States rapidly expanded both its training facilities and the NCO corps to meet the war's exigencies. Modern warfare needed competent and well-trained individuals to achieve success. General John "Black Jack" Pershing, who commanded the American Expeditionary Force in France, established schools for NCOs when he realized that there was a deficiency in the NCO corps' leadership abilities. However, this training was limited to the American Expeditionary Force, was standardized army wide, and did not survive the demobilization following the war.

However, following World War I, NCO training in the U.S. Army spiraled downward in the 1920s and 1930s due to the army being downsized and the lack of funding provided by a parsimonious Congress. The U.S. Army expended little effort to establish schools for their training, and this resulted in a degree of loss of both the power and prestige of the NCO corps. Only with the onset of the Second World War did the United States aggressively institute new and improved training methods of its geometrically expanding forces, especially for its nascent armored forces being then trained at Fort Knox, Kentucky. This new innovation to the combat equation necessitated not only highly trained NCOs to man newly developed armored vehicles and master the tactics necessary to obtain eventual victory but also skilled technicians to repair them as machines wore out in both training and combat. Training during the war went on at an unprecedented pace and scale, with NCOs being the driving force in the training of the enlisted force. However, following the war's end, training once again fell to a very low priority as America sought to save funds in the early postwar era.

From World War II to the Present Day

During World War II, there was a serious shortage of NCOs throughout the U.S. Army. Modern warfare consumed more individuals than could be replaced. To combat this problem, the 28th Infantry Division created its own NCO academy in an attempt to remedy the situation, located in Belgium in 1944. Unfortunately, the Battle of the Bulge created such a critical need for combat soldiers that this school came to an untimely end.

The U.S. Army's first attempt to create and implement a formal educational and career development program commenced in 1947 in the early years of the Cold War. Prior to this, the 88th Infantry Division, quartered in Italy at the end of World War II, established the Lido Training Center. However, shortly after the center was opened, the division returned to the United States for demobilization and thus ended the life of the school. The severe shortage of trained NCOs caused the commanding general of the U.S. Constabulary in Germany to open a school to train NCOs located at Sonthofen, Germany, in the German Alps on the border with Austria. However, insufficient funds also doomed

this attempt at establishment of a formal school for the training of NCOs.

Finally, the United States established a permanent academy. The first class of the 2nd Constabulary Brigade began late 1949, located in Stetten Kaserne and Jensen Barracks in Munich, Germany. After training NCOs for 2 years, the Seventh Army took control of the school and changed its name to the Seventh Army Noncommissioned Officers Academy. In 1958, this school was relocated to Flint Kaserne in Bad Toelz, which was formerly an SS (German *Schutzstaffel*, which translates to Protection Squadron) officers training *kaserne* (a German word, which translates to "barracks"). Presently, the Seventh Army NCO Academy is located in Grafenwoehr, which has been its home since 1991 when the United States once again commenced a drawdown in the aftermath of the Persian Gulf War. In keeping with the concept of standardized training for all NCOs, the U.S. Army implemented Army Regulation 350-90, which established standards that would extend throughout the U.S. Army.

During the Vietnam War, the need for NCOs was greatly exacerbated by both attrition in the NCO corps and the vast expansion in the number of personnel serving. In June 1967, the army chief of staff, General Harold K. Johnson, addressed this problem with a radical solution. To meet this growing need, the U.S. Army created the Noncommissioned Officers Candidate Course—derisively known throughout the army as "shake and bake." It was intended to fill the ranks of the combat arms where the attrition rate among NCOs was the highest. New recruits who showed promise were enrolled at one of three schools for a period of 10 weeks: (1) the infantry received training at Fort Benning, Georgia; (2) the mechanized forces trained at Fort Knox, Kentucky; and (3) artillery soldiers went to Fort Sill, Oklahoma. The basic course was 10 weeks, followed by an additional 10 weeks of training before being sent to Vietnam. On successful completion of the course, graduates received promotion to sergeant, with the top 5% being promoted to staff sergeant. These newly created NCOs were often looked down on by veteran career NCOs who believed that the prestige they had worked so long to achieve was undermined by the newcomers.

In 1971, the Noncommissioned Officer Education System was created. This was the U.S. Army's

first army-wide standardized training program in its history. When the Noncommissioned Officer Education System became fully implemented, it became the most progressive system of formal training and education that the army ever had.

In 1973, the U.S. Army established what is considered the epitome of NCO education—the Sergeants Major Academy at Fort Bliss, Texas. Its purpose was to prepare master sergeants and first sergeants to function as either a sergeant major or a command sergeant major in a worldwide army environment. It was a branch-immaterial course that would serve all military occupational specialties. Over the years, the course content had been modified to reflect the changing technical realities and social fabric of today's army as more women and ethnic groups make up an ever more complex military society.

Once again, the army educational system underwent a major revision with the elimination of the Advanced Noncommissioned Officer Course from the Noncommissioned Officer Education System on October 1, 2004. The wars in Iraq and Afghanistan had placed a visible strain on the system for training NCOs. The army felt that training more relevant to the lessons from combat in Southwest Asia needed to be introduced into the educational curriculum that present and future NCOs needed to be adaptive and able to multitask in the asymmetrical combat environment of modern warfare.

The Contemporary Period: Other Branches of the U.S. Armed Forces

The U.S. Army will continue to recalibrate its training of NCOs to meet the needs of modern asymmetrical warfare where small unit leadership and combat tactics are the current focus of its effort. However, when the U.S. Army reverts, once again, into a peacetime model, it should be expected that the training paradigm for NCOs will again face a major shift in its emphasis. Hopefully, it will be geared to preparing for the next possible conflict and not for the situations formerly faced.

Although the U.S. Army has taken the lead in NCO education, the other services also have a formal education system for their NCOs. The Marine Corps has the U.S. Marine Corps Staff NCO Academy with branches in Camp Pendleton, California, and Quantico, Virginia. These operate

under the aegis of the Marine Corps University and the Marine Combat Development Command. Its mission is to provide essential leadership training and education to prepare individuals for greater roles of responsibility within the U.S. Marine Corps. Subjects taught include public speaking, administration, writing, and warfighting skills. As in the army, there are various levels of instruction geared to the service member's rank.

The U.S. Navy has its Senior Enlisted Academy, established in 1981 with an initial class of 16 students. It is located at the Naval War College in Newport, Rhode Island. The navy also has schools for lower ranking petty officers such as the Petty Officer Indoctrination Course located in Sasebo, Japan.

The U.S. Air Force also has various schools for training its NCOs, which are covered under AFI 36-2301. These consist of four levels of education: (1) Airmen Leadership School, (2) NCO Academy, (3) Senior NCO Academy, and (4) the Chief Master Sergeant Course. Schools are located worldwide throughout the United States, the Pacific, and Germany. Like their counterparts in the other services, these schools are designed to teach leadership, professionalism, and communication skills.

Finally, the U.S. Coast Guard operates its Petty Officer Academy. It was initially established in 1982 with 10 students in Yorktown, Virginia. In 1985, the course was moved to Petaluma, California. Its mission mirrors that of other services in training its personnel for assuming greater positions of responsibility within the Coast Guard.

With the ever-increasing demands made by warfare, it is imperative the NCOs of all services be provided with both the technical and leadership training necessary to lead in combat and to emerge victorious. The United States has led the way forward in providing this training. To date, this has proven successful as demonstrated by the junior leaders in the conflicts in both Iraq and Afghanistan.

NONCOMMISSIONED OFFICERS

Noncommissioned officers are enlisted personnel holding a rank—such as corporal or sergeant—giving them leadership over other enlisted personnel. This entry discusses the history, roles, and responsibilities of the noncommissioned officer (NCO).

Ancient Times

The roots of the NCO can be traced to the legions of ancient Rome. The commander of the legion realized that administrative requirements combined with the drill necessary in the field for a then-modern army was consuming an inordinate amount of his available time. The Roman legion was an efficient fighting force for numerous centuries, defeating enemies who were often larger in stature and far more numerous than themselves. The Roman writer Vegetius wrote that few men were born with valor in their hearts and that only by training and the instilling of discipline could an army become victorious. However, the Roman Empire fell into decay and so did the former magnificent fighting machine, the legion, which had undergone numerous changes since its original inception. The fall of Rome led to warfare devolving into general melees where there was little control exercised by an army's leadership after the initial clash of arms. Over a period of centuries, the primary fighting organization centered around the mounted knight who was attended by his squire during the period known as the Middle Ages. The squire was not formally a NCO in the sense we understand one to be today but was a cut above the semiorganized rabble that constituted the infantry levees made up of peasants hastily conscripted for the fighting season.

Effect of Advent of Firearms

This combat equation was radically altered with the advent of gunpowder, which completely revolutionized and changed warfare. Firearms once again made the infantry the primary arm of decisive combat where training and drill were necessary for an effective combat formation to attain victory. Circa the 1500s, NCOs once again surfaced, and by the 1700s, they became a definitive rank of distinction.

In 1445, King Charles VII of France created the first standing army in Europe since the demise of the Roman Empire. Charles organized his forces into *bandes* or regiments, each consisting of eight companies. The senior NCO in each company was called *serjeant* while his principal assistant was known as the *caporal*. Lowest on the NCO chain was the *lance spessade*, which evolved into lance corporal. The senior NCO of the regiment was known as the “sergeant high general,” which is the equivalent of today's sergeant major. His principal responsibilities included the maintenance of order and discipline in garrison and maintaining the order of the regiment while marching in formation.

During its numerous wars to regain control of the Low Countries, Spain developed the basic tactical unit of the 550-man battalion, which out of necessity needed a high degree of organization and discipline. These battalions relied on NCOs to provide leadership. At this point, we see the sure mark of professionalism emerging in European armies.

Early U.S. Army

In the United States, the NCO's status can be traced to the nascent Continental Army, which was formed in 1775 under the leadership of General George Washington. The Continental Army of the colonies was modeled on its British counterparts. By the mid-1700s, the rank structure throughout the various European armies was fairly standardized. While officers received their commissions based on social status, political connections, wealth, and education, NCOs obtained their positions based on their proven performance in combat. However, it has been argued that the U.S. Army has in its lineage traditions that can also be traced to France and Prussia.

Initially, in the Continental Army, there was little uniformity with respect to the qualifications of the NCOs. They were either appointed or elected as a result of their proven valor in combat.

However, all this changed with Baron Von Steuben being appointed the first Inspector General of the Continental Army on May 5, 1778. On March 29, 1779, the *Regulations for the Order and Discipline of the Troops of the United States* made its debut; this is commonly referred to as the “Blue Book.” This publication provides guidance on drill, operations, and guard duty. It also addressed leadership from the regimental commander down to the level of the corporal. von Steuben also stressed that a first sergeant have, at the very least, rudimentary reading and writing skills. The essence of von Steuben’s “Blue Book” has been distilled to form the basis of drill for the modern U.S. Army.

Early NCOs were identified by epaulets in the British army. However, individuals serving in the nascent Continental Army used cloth strips for identification. Washington’s rebel rabble could ill afford such luxuries as epaulets to identify their rank since their priorities were centered on military necessities such as weapons and provisions. While it may appear to be peculiar today, if an NCO left the regiment where he was promoted, his rank did not go with him and remained with the regiment. This was a large incentive for an individual to refrain from transferring to another unit and to maintaining a well-trained cadre. In 1821, the U.S. Army devised a system of chevrons, which prior to 1854 were worn with their points facing downward. Many erroneously believe that the change in chevron direction was due to units losing their regimental colors in the Civil War and done as a form of public humiliation. Later, in 1825, the U.S. Army made its first attempt at a systematic system for the selection of its NCOs.

As America expanded westward, NCOs took an ever-increasing role in the responsibility for care and welfare of the lower enlisted ranks. A small army with a large number of isolated small posts made it impossible for commissioned officers to be with every small contingent of soldiers.

Technological improvements in many ways changed the traditional functions of the NCO. Whereas in earlier times apart from infantry and cavalry, there were only quartermaster, ordnance, and artillery roles for soldiers, modern warfare created the need for communications, intelligence, and numerous other positions that were necessary to support a modern army in both the field and in garrison. The Civil War exacerbated this need for technicians within the army. In the post-Civil War era, the army

was forced into competition with the civilian sector for individuals with technical training. This led to differentiating pay scales to attract individuals with the necessary skills to fill positions as NCOs.

In his 1895 poem *The Heathen*, the epic poet of British Empire, Rudyard Kipling, coined the phrase “backbone of the army” to describe the position of importance the NCO held in the British army and now taken for granted in most modern armies. The U.S. Army almost immediately adopted that phraseology and concept to its NCO corps.

The Early Navy

In contrast to the U.S. Army, the U.S. Navy had what amounted to an ad hoc enlisted force, with sailors generally recruited for a particular voyage and discharged at the end of it. A high proportion of the enlisted sailors were not citizens of the United States; often navy vessels recruited in foreign ports. Petty officers, the equivalent of sergeants in the army, received their appointments from a ship’s captain and served at his pleasure. Only after the Civil War did the navy begin to systematically formalize the rank structure of the noncommissioned ranks by formally creating the ranks of first, second, and third class of petty officers. In 1894, the rank of chief petty officer was formally created, and this NCO acquired legendary status in the battleship navy that emerged in this era.

All armed forces are hierarchical structures, but naval vessels are particularly regimented in this regard. Despite the cramped condition of naval vessels, even in the modern era, officers and sailors led segregated lives, including separate messes and sleeping quarters. NCOs played a crucial function in mediating between officers and enlisted personnel. In a service where the officer corps became increasingly dominated by graduates of the United States Naval Academy, the position of petty officer, especially chief petty officer, was a position in reach for the meritorious sailor. Even during World War II, when the navy needed to greatly expand the ranks of the officer corps, only a small portion were drawn from the enlisted ranks.

The 20th Century and Beyond

During World War I, the rapid expansion from a peacetime army to one mobilized for war necessitated the expansion of the NCO corps in the U.S. Army. NCOs were mainly responsible for the training of

almost 4 million men inducted into the army and the approximately 1 million individuals who served overseas. Many soldiers received promotions that they were otherwise unqualified for, and in the rapid demobilization, they reverted to their former rank.

The professionalism of the U.S. military also suffered as a result of that drawdown and the general malaise that affects an army after a war when politicians viewed the military in the most expedient manner in which to cut the expenses of the nation. As a result, schooling opportunities and pay for NCOs declined, which led to a lowering of both the morale and prestige of the corps. Only the rapid buildup of the military prior to World War II reversed this trend. However, years of neglect could not be corrected overnight.

During World War II, the rapid rise in the use of technology led to a unique method to deal with individuals with the expertise in handling the equipment so necessary for modern warfare. What became known as the “technical” sergeant came into being. This rank remained in the U.S. Army until 1948, when it was replaced by sergeant first class, and in the Marine Corps until 1958, when it became a gunnery sergeant. The U.S. Air Force still has this rank and is the pay grade E-6.

The rapid demobilization following World War II had an extremely negative effect on the NCO corps of the military forces of the United States. Many individuals began to feel that a career in the military was roughly equivalent to a civilian job. This was to have an extremely detrimental effect on combat readiness at the commencement of the Korean War. However, there were still enough grizzled combat veterans of World War II to stave off military disaster, instilling basic values and training new recruits in their combat roles, as NCOs had done for years. One lasting effect that the Korean War had on the U.S. Army was to point out the need for more highly trained small unit leaders. As a result, there was a greater emphasis on the standards for selection and training of individuals to serve as NCOs.

The Navy and the Marine Corps

Since the end of World War II, there has been a radical transformation in the role of the NCO in the various military services. The rapid expansion of the U.S. Navy led to a complete transformation of the petty officer ranks. The “Old Salts” had obtained their positions by years of hard work combined with

a certain degree of luck. Individuals received rapid promotions for which they might have possessed technical competence. However, many did not have sufficient maturity or naval experience to enhance the prestige of the petty officer ranks. They did not understand that part of their job necessitated the enforcement of the trite phrase “good order and discipline” of the navy. However, with the advent of the “nuclear era,” navy technicians have become the primary focus of the enlisted grades. These types of individuals, while exceedingly intelligent and competent from a technical standpoint, tended to exacerbate the problem that commenced during World War II—the lack of the leadership skills of the Old Salts.

Today, the U.S. Navy has set about correcting these systemic problems. The 21st-century navy stresses leadership along with technical competence. To keep abreast of the ever-changing methods of waging modern naval warfare and to have leaders at the lowest possible level, the U.S. Navy has developed three school programs to enhance the Petty Officers Corps. They are (1) the Front Line Leadership Development Program (FLLDP), (2) the Primary Leadership Development Program (PLDP), and (3) the Advanced Leadership Development Program (ALDP). These programs have evolved from the Naval Leadership Continuum and in many ways mirror the U.S. Army’s Noncommissioned Officer Education System.

The creation of a separate air force by the United States also radically changed the enlisted/officer equation. As in the navy, enlisted ranks tended to have more technicians than leaders since the officers generally flew off into combat, leaving the senior NCO leadership in the rear to take charge of the administrative and support functions.

Transformation of the Army

During the 1950s, the U.S. Army, to meet congressionally mandated grade levels, devised a system where the specialist grade came into being. A specialist fell into the position of an NCO at that pay grade and the rank a pay grade lower. Thus, individuals received the pay but not the prestige of an NCO. The argument was that many technical skills required skilled technicians rather than NCOs to perform these tasks. This continued for years until all the specialist ranks were gradually eliminated save the one for the pay grade of E-4 that remains even today in the army.

Vietnam was another lesson the army learned concerning the capability of its NCO corps. Initially, Americans became involved in Vietnam as advisors to train their Vietnamese counterparts. The vast majority of the unit-level training was taught by career NCOs. However, as the combat role of the U.S. military vastly expanded, the NCO became a front-line small unit leader. The army unfortunately underwent a high rate of attrition due to combat casualties, and many individuals received promotions that they would have been otherwise unqualified to receive during a peacetime force.

The army has transformed itself in a much different manner from the other services. With the traditional focus of linear combat becoming supplanted by what is today termed *asymmetrical warfare*, the NCO has become increasingly important in the overall conduct of military operations. The highly educated, motivated, and professional force being marshaled by the United States to fight in such far-off regions of the world as Iraq and Afghanistan has made the NCO indispensable to any hope of victory. NCOs now can make decisions on the ground, formerly the purview of commissioned officers. The success of the U.S. Army in a large measure will be a test of whether the modern corps of NCOs can adapt to the rapidly evolving nature of 21st-century warfare.

Post-9/11 NCO Training

Since the national trauma of September 11, 2001, few American institutions have undergone such a rapid and radical change as the military. While the average citizen is well aware of the long lines at the airports and a higher police profile with more formidable weaponry at their disposal, it is the army that has borne the brunt of the nation's security demands. The low-level insurgencies that the army has committed itself to fighting have required the military leadership to be more adaptive at all levels, especially the NCO. General David Petraeus penned the army's *Counterinsurgency Field Manual*, which was created to develop a military strategy to counter the asymmetrical warfare encountered in both Iraq and Afghanistan. This enabled the army to develop experienced combat leaders down to the squad level as a result of repeated combat deployments. However, there has been a downside that coincided with this positive development.

These repeated deployments, while developing magnificent combat leaders have placed the U.S.

Army in danger of losing many of the traditional skills of the NCO corps. NCOs no longer conduct close order drills, perform in-ranks inspections, and provide the old "Sergeant's Time" training that the army considered essential just a few years ago. The quick turn-around between deployments has left little time for these traditional skills. This has exacerbated the problem that skills such as close-order drill have been virtually eliminated from initial training and have been replaced with training that is more combat oriented to meet the exigencies of today's military situation. Having identified the problem, the army hopes to rectify the situation with its anticipated gradual disengagement from Afghanistan.

Today in Afghanistan, the Marine Corps is taking up an ever-increasing role in combat actions in that desolate landlocked nation. Concomitant with that mission, the U.S. Marine Corps is relying increasingly on its NCOs to provide leadership to its lower ranking enlisted personnel. Despite reliance on an ever-increasing role of technology in combat, the marine or soldier led by the NCO is still the tip of the spear.

Both the U.S. Army and the U.S. Marine Corps have assumed a greater role in the training of the fledgling Afghan National Army that is more akin to the traditional role of NCOs. Unfortunately, this situation has been clouded with an ever-increasing number of "green on blue"—"friendly" fire by Afghan trainees directed against their instructors. Only time will tell whether the efforts to create a viable Afghan military will reach fruition under the current circumstances.

Summation

The role of the NCO in all military services today continues to be that of a primary trainer and leader of junior enlisted personnel, and there will be no shift in the focus of that mission in the foreseeable future as the asymmetric threat to the United States intensifies in the 21st century.

NORTH AMERICAN AEROSPACE DEFENSE COMMAND (NORAD)

North American Aerospace Defense Command (NORAD), originally the North American Air Defense Command, began its existence on May 12, 1958, as a joint Canada-U.S. command. There is no formal NORAD treaty; rather, technical and diplomatic notes were exchanged in 1957. NORAD was designed to warn against and defend North America from Soviet bomber strikes—work that it did with little fanfare. Indeed, for many North Americans, their only knowledge of NORAD came from childhood memories of television reports about how NORAD was tracking Santa's sleigh on Christmas Eve. Al Qaeda's attacks on the World Trade Center and the Pentagon on September 11, 2001, using hijacked civilian jets and a potential Canadian role in continental ballistic missile defense (BMD), however, have raised concerns about NORAD's long-term viability. This entry examines the history and functions of NORAD and discusses some of the controversies and problems associated with the organization.

The notion of North America as a geostrategic entity in aerial matters has long roots. In the early 1920s, the American air power prophet General Billy Mitchell advocated unsuccessfully for a Canada-U.S. aerial alliance directed against Japan. But World War II highlighted Canada's growing importance as a strategic bulwark for the United States, for Canada

provided bases and other infrastructure allowing the United States to funnel planes and supplies to Britain and the Soviet Union. By 1943, though, worried by the scale and apparent permanence of the U.S. effort and fearful that Canada might become a new battleground if postwar U.S.-Soviet relations deteriorated, nationalist Canadian officials began warning of the possible creation of a U.S.-style Maginot Line in northern Canada. Such warnings bore fruit as Canada, by the war's end, had bought back U.S. interests in military projects on Canadian soil. Moreover, an attempt in 1945 by the U.S. Section of the Permanent Joint Board on Defense to formalize Canada-U.S. continental defense efforts was rebuffed by Canada's government. When a deal to cooperate in Canada's north was reached in 1947, it proved very limited given the Canadian concerns about protecting national sovereignty.

The onset of the Cold War brought dramatic changes. By 1949, Canada joined the North Atlantic Treaty Organization to defend Western Europe against the Soviets. When war erupted in Korea in June 1950, Canada took part in the U.S.-led effort to repulse North Korean aggression by sending combat units to Korea. For the first time, Canada dispatched troops to Europe in peacetime, and then, in 1951, Canada began the largest peacetime rearmament in its history. Continental defense cooperation with the United States also deepened. In 1951, the two nations agreed to build the Pinetree Line, 33 radar stations situated on the Canada-U.S. border, to warn against Soviet bombers. Completed by 1954, Pinetree cost \$450 million, two thirds of which was paid for by Washington. The Mid-Canada Line, 98 radar stations on the 55th Parallel and paid for by Canada, was complete by 1958. The Distant Early Warning Line was more controversial. Ready by 1957, 58 Distant Early Warning radar and warning stations, constructed across the high Arctic from Alaska to Baffin Island, were mostly manned by U.S. personnel, raising questions about sovereignty among Canadian nationalists.

Growing Soviet aerial capabilities pointed to the need for formalized cooperation, and cooperation of the Royal Canadian Air Force was keenly sought. By August 1957, Canada's Liberal government under Prime Minister Louis St. Laurent had agreed to NORAD, with joint operations beginning in September 1957. The final deal, however, was ratified in May 1958, by John Diefenbaker's Conservative government. Headquartered at

Cheyenne Mountain in Colorado, with a Canadian subheadquarters at North Bay, Ontario, NORAD has always been led by a U.S. commander who is aided by a Canadian deputy.

NORAD has faced problems. First, ballistic nuclear missiles made the defense against Soviet attack mostly moot. The ability to give adequate warning of an attack thus became paramount. Second, missiles obviated the need for radar lines, which were largely shut by the 1980s. Third, there were command problems. The most famous contretemps occurred during the 1962 Cuban Missile Crisis when Prime Minister Diefenbaker, unhappy with President John F. Kennedy's policies and misunderstanding how NORAD worked, delayed putting Canada's forces on alert for a number of days after U.S. forces were warned that war was imminent. With the revival of the Cold War confrontation in the early 1980s, a declining NORAD received some new resources, notably a new North Warning System

to replace the obsolete Distant Early Warning Line. But the Soviet Union's collapse in 1991 led many to question NORAD, leading NORAD to justify its existence, in part, by using its resources to track small aircraft smuggling drugs into North America.

The 9/11 attacks both benefited and injured NORAD. First, the need to safeguard North American air defense against unexpected threats was highlighted. Second, while there is some debate as to whether NORAD failed by not intercepting the hijacked planes before they struck their targets, NORAD planes reacted quickly during the crisis to control airspace after the attacks. But increasing U.S. concerns about the threat from rogue nuclear powers and the subsequent trumpeting of the need for continental BMD damaged NORAD as the U.S. military created new and entirely U.S. command systems—notably Northern Command—to deal with such threats, especially after Canada declined to officially participate in BMD in late 2006.

American and Canadian members, working in the North American Aerospace Defense Command's (NORAD) center inside Cheyenne Mountain, Colorado, keep an eye on the sky looking for threats aimed at the continent.

Source: Master Sergeant Val Gempis.

NORAD's Canadian supporters always have noted that NORAD gave Canada a seat at the U.S. strategic decision-making table. This claim was exaggerated. NORAD was, and is, an operational agency, not a policy-making body. Still, Canadian participation in NORAD provided real security benefits to Canada as the nation could not have afforded, on its own, to mount a credible independent air defense in the Cold War. Having a Canadian deputy at NORAD with the power to potentially order a nuclear strike in the absence of his or her U.S. superior points to NORAD's uniqueness among U.S. bilateral security deals with its various global allies.

NORTH ATLANTIC TREATY ORGANIZATION

For a long time, the North Atlantic Treaty Organization (NATO), an international alliance, was considered to have a monopoly on deterrence of real and potential enemies for European and North American security. However, it has changed considerably as a military alliance in the past 10 to 15 years: today NATO is more an international crisis manager than a defensive alliance. At the same time, concerns about NATO's commitment to defend some member states have emerged. In light of the new NATO Strategic Concept (which was adopted in November 2010), some allies have asked to broaden the understanding of an "armed attack." The current reading of Article V (stating that "an armed attack against one or more of the allies in Europe or North America shall be considered an attack against them all") does not necessarily cover

a range of actions (e.g., cyber attacks, energy supply disruptions, etc.), to which some allies have already been subjected. This entry provides a brief overview of NATO's history and main current activities and examines the bloc's structure and the main elements of its organizational transformation to reassess NATO's relevance in the 21st century.

Formation and Members

Headquartered in Brussels (Belgium), NATO was formed in 1949 by the Washington Treaty (the 12 founding members of NATO were Belgium, Canada, Denmark, France, Iceland, Italy, Luxembourg, the Netherlands, Norway, Portugal, the United Kingdom, and the United States). NATO was primarily set up to discourage an attack by the Soviet Union on the non-Communist nations of Western Europe, in addition to the goal of maintaining peace among former enemies in Western Europe. In 1955, the Soviet Union and the Communist nations of Eastern Europe (Albania, Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, and Romania) formed their own military alliance to oppose NATO: the Warsaw Pact Organization. At the end of 2010, NATO consisted of 28 countries (Albania, Belgium, Bulgaria, Canada, Croatia, Czech Republic, Denmark, Estonia, France, Germany, Greece, Hungary, Iceland, Italy, Latvia, Lithuania, Luxembourg, the Netherlands, Norway, Poland, Portugal, Romania, Spain, Slovakia, Slovenia, Turkey, the United Kingdom, and the United States), while the Warsaw Pact Organization was dissolved in 1991.

Since its creation, the alliance has undergone six rounds of enlargement. The first three rounds took place during the Cold War, adding Greece and Turkey (1952), West Germany (1955), and Spain (1982). The reunification of Germany in October 1990 incorporated the territory of the former East Germany into NATO. After the collapse of the Soviet Union, the alliance invited the Czech Republic, Hungary, and Poland (former members of the Warsaw Pact) to join (this happened in 1999). The fifth expansion took place in 2004, when seven other Central-Eastern European countries (Bulgaria, Estonia, Latvia, Lithuania, Romania, Slovakia, and Slovenia) joined NATO. Albania and Croatia subsequently joined NATO in April 2009. In the same year, Bosnia and Herzegovina and Montenegro

were invited to start Intensified Dialogues on their membership aspirations and related reforms. Allied leaders also decided to invite the former Yugoslav Republic of Macedonia to become a member as soon as a mutually acceptable solution to the issue over the country's name has been reached with Greece (Greece opposes the post-1991 constitutional name of its northern neighbor, citing historical and territorial concerns). Member states have also agreed that Georgia and Ukraine will become members in the future. Since its founding, NATO expansion has encouraged and supported democratic reforms; fostered cooperation, consultation, and consensus-building; and contributed to stability and security in the Euro-Atlantic area.

Structure and Operations

Since NATO's creation, the alliance's most important body has been the North Atlantic Council (NAC), consisting of permanent representatives (ambassadors) from each member state. The NAC has overall political authority and ultimate powers of decision making relating to all NATO deployments and operations. NAC meetings are chaired by the secretary general of NATO. There is no voting or decision by majority in the NAC: All decisions must reach unanimous agreement. The Military Committee (consisting of countries' military representatives) is the alliance's second pivotal body. The Military Committee provides military advice to the NAC and is responsible for recommending the measures considered necessary for the common defense or the implementation of operational decisions made by the NAC.

In June 2003, NATO defense ministers agreed on the design of a new streamlined military command structure, which was designed to be more flexible, more efficient, and better able to conduct the full range of alliance missions. As a result, new bodies—the Allied Command Transformation (ACT) and the Allied Command Operations (ACO)—were created. The ACT is responsible for improving the military effectiveness of NATO forces. In doing so, it enhances training, improves capabilities, tests and develops doctrines, and conducts experiments to assess new concepts. Although the ACT headquarters is located in Norfolk, Virginia (the United States), it also includes the Joint Warfare Centre in Norway, the Joint Force Training Centre in Poland,

and the Joint Analysis and Lessons Learned Centre in Portugal. The ACT also supervises the Undersea Research Centre in La Spezia (Italy). There are direct connections between the ACT and the alliance's school in Oberammergau (Germany), the NATO Maritime Interdiction Operational Training Centre (located in Greece), and NATO agencies. In addition, the command supports a number of nationally or multinationally sponsored centers of excellence focused on transformation in specific military fields.

The ACO is responsible for NATO operations worldwide. The ACO's commander is called Supreme Allied Commander Europe and is based at the Supreme Headquarters Allied Powers Europe, located at the Belgian city of Mons. The Supreme Allied Commander Europe traditionally is a U.S. four-star general who simultaneously heads the U.S. European Command headquartered in Stuttgart (Germany). The ACO includes a multinational headquarters called Joint Force Command Brunssum (located in Brunssum, the Netherlands), Joint Force Command Naples (located in Naples, Italy), and Joint Command Lisbon (located in Lisbon, Portugal).

Collective defense is a core aspect of the alliance. However, in its quest to remain relevant in a rapidly evolving political and military context, NATO is constantly reexamining its organizational structure and its proper role. The approval of the New Alliance Strategic Concept (in 1991) emphasizing dialogue and cooperation signaled a shift to a more politically active and nonthreatening alliance. By 1992, the alliance had agreed to support the Organization for Security and Co-operation in Europe (OSCE) and UN peacekeeping operations, thereby expanding NATO's central focus on collective defense to include peacekeeping and crisis management. However, it is expected that new, "unexpected," and asymmetrical dangers related to terrorism will continue to emerge or intensify during the coming decade. Thus, in November 2009, NATO began public debates pertaining to the renewal of its Strategic Concept, which should redefine NATO's core tasks. The new Strategic Concept (which should replace the one from 1999) should serve as an invocation of political will clarifying both what NATO should be doing for each ally and what each ally should be doing for NATO.

NATO's first involvement in cooperative security efforts was the NATO-led Implementation Force

and Stabilization Force missions in the Balkans. In 1995, the United States convinced NATO to initiate these missions in order to safeguard the implementation of the Dayton Accords. Subsequently, in an effort to halt the ethnic cleansing in Kosovo, NATO engaged in an air campaign against Serbia and undertook an additional peacekeeping operation in Kosovo. Due to a lack of political will and an insufficient understanding of the region's social dynamics, the Kosovo mission unintentionally became an instance of "aerial warfare diplomacy" that proved highly problematic morally, politically, and militarily. As a consequence, NATO failed to stop the ethnic cleansing, damaging NATO's reputation and reflecting poorly on the ability of Western governments to legitimize international interventions to prevent mass atrocities.

Those shortcomings notwithstanding, NATO continued to engage in an increasingly diverse array of operations. After the attacks of September 11, 2001, NATO invoked Article V of the Washington Treaty and began two operations: air Operation Eagle Assist (in which NATO Airborne Early

Warning aircraft began assisting in monitoring the skies over North America) and naval Operation Active Endeavour (providing safe passage for allied shipping in the Straits of Gibraltar and operations throughout the Mediterranean). In August 2003, NATO assumed command of the UN-mandated International Security Assistance Force (ISAF), established to provide assistance in restoring stability and self-governance in Afghanistan. Since 2006, NATO/ISAF combat forces have launched several operations, including Operation Medusa in 2006, which was designed to oust Taliban forces in Kandahar Province. In 2007, NATO and Afghan forces conducted operations called Achilles and Silicon against Taliban forces. Beginning in 2008, in reaction to increased Taliban operations, NATO forces enlarged their offensive operations in Afghanistan. Today, roughly 70,000 military personnel are, or recently were, engaged in NATO missions in Afghanistan, Kosovo, Iraq, the Mediterranean, off the Horn of Africa, and in Somalia, managing complex ground, air, and naval operations in all types of environments (see Table 1 for further details).

Table 1 NATO Missions and Operations (1995–2012)

<i>Place</i>	<i>Description of NATO's Activities</i>
<i>Current Missions</i>	
Afghanistan (2003 to the present)	Established by UN mandate in 2001, the ISAF has been under NATO leadership since August 2003. ISAF comprises approximately 85,000 troops from approximately 40 different countries. Its mission is to extend the authority of the Afghan central government in order to create an environment conducive to the functioning of democratic institutions and the establishment of the rule of law.
Kosovo (1999 to the present)	Having first entered Kosovo in June 1999 to end widespread violence and halt the humanitarian disaster, KFOR troops continue to maintain a strong presence throughout the territory, preserving the peace that was imposed by NATO more than a decade earlier. Today, approximately 10,000 allied troops operate in the Balkans as part of NATO's KFOR.
Mediterranean Sea (2001 to the present)	In the aftermath of the September 11, 2001, NATO launched the maritime surveillance Operation Active Endeavour in October 2001. Led by NATO naval forces, Operation Active Endeavour is focused on detecting and deterring terrorist activity in the Mediterranean.
Horn of Africa (2009 to the present)	Building on previous counterpiracy missions conducted by NATO, operation Ocean Shield is focusing on at-sea counterpiracy operations off the Horn of Africa. Approved on August 17, 2009, by the North Atlantic Council, this operation is contributing to international efforts to combat piracy in the area. It is also offering assistance to regional states in developing their capacity to combat piracy activities.

Table I Continued

<i>Place</i>	<i>Description of NATO's Activities</i>
African Union (2007 to the present)	Since June 2007, NATO has assisted the AMISOM by providing airlift support for AU peacekeepers. NATO also continues to work with the AU in identifying further areas where NATO could support the African Standby Force.
<i>Terminated Operations and Missions</i>	
Libyan Civil War (March 31 to October 31, 2011)—Operation Unified Protector (following the United States, Odyssey Dawn etc.)	In late March 2011, NATO launched Operation Unified Protector to absorb command over the multinational coalition led no-fly zone and naval blockade of Libya. Initiated by Britain, France, and the United States of America, the NATO coalition included military assets from 18 nations that struck at forces loyal to Muammar Qaddafi in a mission to protect Libyan civilians. NATO forces flew nearly 10,000 strike missions in support of the National Transitional Council rebel forces that eventually captured and killed Qaddafi. Satisfied in the conclusion of the conflict, NATO ended Operation Unified Protector in October 2011.
Iraq (2004–2011)	At the Istanbul Summit in June 2004, the allies agreed to help Iraq in establishing effective and accountable security forces. The outcome was the creation of the NTM-I. The NTM-I delivered its training, advice, and mentoring support. All NATO member countries contributed to the training effort either in or outside Iraq, through financial contributions or donations of equipment.
Gulf of Aden, Horn of Africa (October–December 2008, March–August 2009)	From October to December 2008, NATO launched Operation Allied Provider, which involved counterpiracy activities off the coast of Somalia. NATO naval forces provided escorts to UN WFP vessels transiting through the waters in the Gulf of Aden. From March to August 2009, NATO launched Operation Allied Protector, conducting surveillance tasks and providing protection to deter and suppress piracy and armed robbery.
Pakistan (October 2005 to February 2006)	The Alliance airlifted close to 3,500 tons of supplies and deployed engineers, medical units, and specialist equipment to assist in relief operations. This was one of NATO's largest humanitarian relief operations.
FYROM (August 2001 to March 2003)	NATO implemented three successive operations in FYROM from August 2001 to March 2003. First, Operation Essential Harvest disarmed ethnic Albanian groups operating on Macedonia's territory. The follow-on Operation Amber Fox provided protection for international monitors overseeing the implementation of the peace plan. Finally, Operation Allied Harmony was launched in December 2002 to provide advisory elements to assist the government in ensuring stability throughout the Macedonian territory.
Bosnia and Herzegovina (1995–2004)	Between 1995 and 2004, NATO led a peace support force in Bosnia and Herzegovina, helping maintain a secure environment and facilitating the country's reconstruction in the wake of the 1992–1995 war. A NATO-led IFOR of 60,000 troops served in Bosnia to implement and monitor the military aspects of the agreement. IFOR was succeeded by a smaller (32,000 troops) NATO-led SFOR, which was aimed to prevent renewed hostilities and stabilize peace. In 2004, SFOR was replaced by the 7,000 troops of the EU.

Abbreviations: NATO, North Atlantic Treaty Organization; ISAF, International Security Assistance Force; KFOR, Kosovo Force; AU, African Union; AMISOM, African Union Mission in Somalia; NTM-I, NATO Training Mission in Iraq; WFP, World Food Programme; FYROM, former Yugoslav Republic of Macedonia; IFOR, International Peacekeeping Force; SFOR, Stabilization Force; EU, European Union.

The recently ratified Lisbon Treaty extending the European Union (EU) engagement in security and defense also introduced a collective defense obligation binding all EU member states to provide aid and assistance “by all means in their power” in the event of another member state becoming a victim of armed aggression. The continued development of the EU Common Security and Defence Policy raises questions about the future of NATO (as 21 out of 27 EU member states are also members of NATO). Specifically, NATO’s relevance is called into question by two related issues. First, in many cases, NATO instruments have proven insufficient to address the most important challenges. For instance, NATO has little or no relevance to the financial crisis, climate change, energy, and other key issues. Even with regard to security and defense issues, a comprehensive approach is required that integrates the political, economic, and social dimensions. Second, the EU is emerging as an actor in its own right, building up capabilities in both defense and in the field of diplomacy. Thus, decision making (at least in regard to security and defense in Europe) may shift from the NATO’s NAC to the EU’s External Action Service in the near future.

Nevertheless, today the EU and NATO are working to support each other’s efforts. The Berlin Plus agreements (the most important of them concluded in 2002) give the EU the authority to use NATO assets in case the EU wants to act independently. The Berlin Plus arrangements cover three main elements directly connected to operations: EU access to NATO’s command arrangements and reconnaissance aircrafts also assists in operational planning. On the other hand, several points suggest the potentially problematic nature of implementing the Berlin Plus agreements. Firstly, when the EU and NATO carry out two simultaneous but separate land or sea operations, the Berlin Plus arrangements do not apply. Second, the Berlin Plus agreements do not provide for the possibility of combining civilian and military instruments. Finally as an organization, NATO does not have many capabilities to offer the EU, and the Berlin Plus agreements do not give the EU the opportunity to access U.S. resources. Therefore, the ability of the EU and NATO to cooperate under the Berlin Plus agreements remains unclear.

NORTHROP GRUMMAN

Northrop Grumman is a leading global security firm possessing a varied portfolio of products and technological competencies. The current corporation traces its origins back to the founding of Northrop Aircraft Incorporated and the Grumman Corporation in 1929 and 1930, respectively. Today, Northrop Grumman specializes in aerospace, electronic, and information systems, as well as technical services. Key products include the B-2 stealth bomber, E-2D Advanced Hawkeye airborne warning and control aircraft, Global Hawk unmanned aerial vehicle, and a variety of radar, communication, sensor, and command and control systems. This entry traces the history of Northrop Grumman and its early aircraft and discusses current products and services.

History

Northrop Grumman’s origins emerged from the founding of two key interwar aircraft manufacturers: (1) Northrop Aircraft Incorporated and (2) the Grumman Corporation. Founded in 1929 by Jack

Northrop, a leading aircraft designer who formerly penned designs for Lockheed aircraft, Northrop Aircraft Incorporated slowly grew into a leading aerospace firm. During the interwar years, the firm produced a series of low-wing metal monoplanes—most notably the Alpha, Gamma, and Delta—that achieved notoriety for their speed and forward-thinking design. The corporation's first military aircraft of consequence was the P-61 Black Widow, a night fighter that first entered military service in 1944. After World War II, Northrop pioneered the development of "flying wing" prototypes, though these aircraft achieved only moderate success. During the Cold War, Northrop produced a number of significant aircraft, including the F-89 Scorpion interceptor, F-5 fighter, the widely used T-38 supersonic trainer, and the F/A-18 Hornet. The firm also pioneered the development of intercontinental guided missiles such as the 1960 SM-63 Snark. In 1989, Northrop successfully ushered the B-2 Spirit stealth bomber into service, finally proving the worth of the company's earlier research into flying wings.

Founded in 1930 by Leroy Grumman, Jake Swirbul, Bill Schwendler, E. Clint Towl, and Ed Poor, the Grumman Corporation also distinguished itself in the aerospace field. The firm's 1931 XFF-1 was the U.S. Navy's first aircraft possessing a retractable undercarriage and a fully enclosed cockpit. During the Second World War, Grumman produced a number of distinguished fighter aircraft, most notably 1940's F4F Wildcat and 1944's F6F Hellcat. After the conflict's end, the company continued to be a vital supplier of naval aircraft, including the F9F Panther jet in 1947, the A-6 Intruder attack bomber and E-2 Hawkeye airborne warning and control platform in 1960, and the F-14 Tomcat fighter in 1974. Grumman also distinguished itself in space technology, producing the 1969 Apollo Lunar Module that carried man to the surface of the moon. Grumman's separate history came to an end in 1994, when Northrop acquired the company, creating the formal origins of today's defense giant.

Since its 1994 founding, the contemporary Northrop Grumman Corporation has brought a number of other significant aerospace and defense-related companies under its corporate umbrella. In 1996, the firm acquired the Westinghouse Electric Corporation, a pioneer in the development of radar and a leader in Cold War and post-Cold War radar technologies. A year later, Northrop Grumman brought the Logicon

Corporation, a leader in information systems and services, under its control. In subsequent years, the firm acquired Teledyne Ryan Aeronautical (1999), Litton Industries (2001), Newport News Shipbuilding (2001), and TRW (2002). Teledyne Ryan traced its roots back to the early 1920s, and produced a number of significant aircraft, most notably Charles Lindbergh's *Spirit of St. Louis*. After World War II, Ryan pioneered the development of unmanned aerial vehicles, culminating in the 1998 RQ-4A Global Hawk, a high-altitude, long-distance aerial reconnaissance platform. Litton and Newport News Shipbuilding specialize in the construction of naval vessels, the former focusing primarily on surface platforms, the latter an expert in nuclear-powered submarines and aircraft carriers. TRW represents one of the world's leading developers of satellite payloads and other space-based systems. Among other accomplishments, the company produced the Pioneer 1 spacecraft, lunar module descent engines for the Apollo program, the Milstar system of military communication satellites, and the Chandra X-ray observatory.

Today's Northrop Grumman

Today, Northrop Grumman stands as a leading defense contractor and global security firm, providing a range of products to the U.S. and world militaries and private corporations around the world. The company organizes its products and development into four distinct business sectors: (1) Aerospace Systems, (2) Electronic Systems, (3) Information Systems, and (4) Technical Services. As befits its aeronautical roots, Northrop Grumman continues to offer a range of air- and space-based platforms, including manned and unmanned aircraft, missiles, and space systems. Notable products in the Aerospace Systems portfolio include the B-2 Spirit stealth bomber, E-2D Advanced Hawkeye airborne warning and control aircraft, E-8C Joint STARS airborne targeting and battle management system, Global Hawk unmanned aerial reconnaissance platform, AEHF satellite strategic and tactical relay communication system for the U.S. military, and the James Webb space telescope. Northrop Grumman's Electronics division provides radar systems for the F-16, F-22, and F-35 aircraft; infrared missile warning systems for U.S. aircraft; fire control radars; and the LITENING targeting pod. In the information arena, the firm specializes in military

command and control systems, secure communication networks, and surveillance and reconnaissance systems and also supports the 9-1-1 public safety system. Northrop Grumman's Technical Services division supports maintenance and training programs for U.S. Air Force, U.S. Army Battle Combat Training Program, and biometric capture services for the Department of Homeland Security.

In the post-Cold War era, Northrop Grumman has committed to the international marketplace. In addition to providing products and technical support for U.S. military and civilian agencies, the corporation offers products and services to clients in 25 other countries in Europe, the Middle East, Africa, Asia, and the Pacific. To support these international commitments, Northrop Grumman maintains more than 30 regional business development offices around the world. Outside the United States, the firm's most significant presence is in the United Kingdom, where the company is a key supplier in the defense, information technology, security, and public safety markets.

The Future

Northrop Grumman's commitment to emerging technologies like unmanned aerial vehicles, cyber security, and space-based communication technologies suggests that the firm will continue to maintain a strong presence in both the military and civilian marketplaces in the years to come. The company's diversified portfolio and ongoing focus on research and development place it in a strong position to expand its market share in the contemporary world. Furthermore, Northrop Grumman's strong international presence in emerging markets suggests the potential for continued growth.

NORWICH UNIVERSITY

An independent institution located on a 1,200-acre campus in Northfield, Vermont, Norwich University originally was situated in Norwich, Vermont, where it was established in 1819 as the American Literary, Scientific and Military Academy, thus earning the distinction of the first private military college in the United States. Norwich University is also the oldest of the six Senior Military Colleges designated by the U.S. Department of Defense and is recognized as the “birthplace” of the Reserve Officers' Training Corps (ROTC). This entry discusses the history of Norwich University and lists some of the university's illustrious alumni.

American System of Education

The founder of Norwich University, Captain Alden Partridge (1785–1854), had previously served as superintendent of the United States Military Academy. Partridge was very influential in promoting military education throughout the United States through his highly innovative “American System of Education,” which included instruction in military tactics. For Partridge, the militia was of vital importance because it provided “an impregnable bunker” that protected the liberties of the nation. He viewed a citizen-soldiery as the ideal defense for a democratic republic.

Partridge sought to reform education by expanding the classical curriculum to include not only military tactics but also instruction in scientific and practical subjects, such as engineering, agriculture, political economy, and modern languages. Partridge was not only the father of the military school movement in the United States but also the author, in 1841, of the first comprehensive proposal presented

to Congress for supporting, through federal land grants, institutions of higher education offering instruction in the practical sciences and military tactics. Partridge's concept ultimately was realized, 8 years after his death, through the passage of the Morrill Land Grant Act in 1862.

When the Vermont state legislature chartered Norwich University in 1834, the trustees were required "constantly to provide a course of military instruction, both practical and theoretical." After a catastrophic fire in 1866, the university moved to its current location, Northfield, Vermont, and in 1898, the Vermont legislature designated the institution the "Military College of Vermont." In 1916, the connection between the Vermont National Guard and the Norwich University Corps of Cadets ended when the university became the first site for a Senior ROTC cavalry unit. Norwich remained distinctively a horse cavalry school until 1947 when the War Department stopped supporting the cavalry program and replaced it with armored cavalry training. In 1948, the War Department authorized the creation at Norwich University of a new ROTC program in mountain and winter warfare, which is now called Mountain and Cold Weather Training and continues to be unique among ROTC detachments. Army ROTC at Norwich was augmented by a U.S. Air Force ROTC unit in 1972 and joined by a U.S. Navy ROTC detachment 12 years later. Another institutional milestone was reached in 1974 when Norwich took the leadership role in accepting women into the Corps of Cadets, 2 years before any of the national service academies.

Norwich Alumni

From the early 19th century to the present, Norwich University alumni have played significant roles as military officers, educators, and policymakers. Illustrative of this distinguished record of service are Captain James H. Ward (1823), first commandant of the U.S. Naval Academy; Colonel Truman B. Ransom (1825), killed leading the assault against the Mexican fortress at Chapultepec; Major Edmund Rice (1859), commander of the 19th Massachusetts Infantry Regiment, who received the Medal of Honor for his role in repelling Pickett's Charge at the Battle of Gettysburg; Gideon Welles (1826), secretary of the U.S. Navy, 1861–1869; Colonel Edward Hatch (1850), commander of the 9th U.S. Cavalry ("Buffalo

Soldiers"), 1866–1869; Commodore George Dewey (1851–1854), the third Norwich alumnus to command the Pacific Squadron; Lieutenant General Edward H. Brooks (1916), commander, VI Armored Corps, 1944–1945; General I. D. White (1922), commanding general of the U.S. Army Pacific Command, 1957–1961; Brigadier General Robert F. McDermott (1937–1939), first dean of the U.S. Air Force Academy; Major General Jonas Platt (1940), chief of staff to commander of the U.S. Marine forces in Vietnam; and General of the Army Gordon R. Sullivan (1959), U.S. Army chief of staff, 1991–1995. As many as 138 alumni have served as general or flag officers in the various state and national armed forces of the United States, and 26 alumni have served as general officers in foreign armies. Seven alumni have received the Medal of Honor, and countless others have received recognition for valor or service.

Norwich Today

In recent years, the university has reached new heights of selectivity, enrollment, academic achievement, and recognition as a center for leadership. Of the total 3,450 students enrolled, approximately 1,570 are in the Corps of Cadets, 480 are civilian students, and 1,400 are online graduate students. The regular, full-time, faculty number 120. Currently, the annual institutional budget is approximately \$93.5 million, and the endowment is around \$161 million.

Following for almost two centuries its traditional mission of preparing its students for the responsibilities of citizenship, leadership, and service, Norwich University continues to make significant contributions to national defense. Norwich is consistently among the top two or three institutions nationally in terms of the number of army and marine officers commissioned annually. Also, Norwich is the leading college with respect to the number of students who are commissioned in the National Guard. The university maintains student exchanges with the Australian Defence Force Academy, the Republic of China Military Academy (Taiwan), the Special Military School of St. Cyr (France), and the University of the Bundeswehr (Germany). Among the 31 undergraduate baccalaureate programs offered at Norwich is a distinctive major, Studies in War and Peace, which examines military institutions and their impact on the social order. Another undergraduate program, Strategic Studies and Defense Analysis, is a degree

Norwich University Corps of Cadets on parade.

completion program available online to military personnel who are assigned to the U.S. Special Operations Command. Three online master of arts programs of note include Diplomacy, Military History, and Information Assurance. Norwich was one of the first institutions to be designated a Center of Excellence by the National Security Agency. Two programs among the Norwich University Applied Research Institutes have military applications, the Cyber Conflict Research Institute and the Defense Technologies Institute, the latter focusing on the development of advanced man-portable battlefield systems.

NUCLEAR PROLIFERATION

Nuclear proliferation refers to the acquisition of nuclear weapons technology by nations that did not previously possess them. The spread of nuclear weapons technology has been considered a major threat to global security even before the first nuclear weapons

were developed. Between 1945 and 2006, at least eight different states acquired and tested nuclear weapons: the United States (1945), the Soviet Union (1949), the United Kingdom (1952), France (1960), the People's Republic of China (1964), India (1974), Pakistan (1998), and North Korea (2006). South Africa developed a small arsenal of nuclear weapons in the 1980s but dismantled them in the 1990s. Israel is widely considered to have been a nuclear-armed state since the 1960s, though it has never publicly admitted this. A substantial number of other states have begun nuclear weapons programs of greater or lesser extent but without eventual success. This entry examines the history of nuclear weapons proliferation around the world and discusses nonproliferation regimes and the Nuclear Non-Proliferation Treaty.

Historical Overview

After the 1939 announcement that a fission chain reaction was possible, scientists in the United States, the United Kingdom, the Soviet Union, Germany, and Japan each attempted to notify their governments that a potentially new energy source or weapon was derivable from work in nuclear physics. Each of these countries began small, exploratory nuclear programs. In 1941, encouraged by scientific calculations suggesting the feasibility of a bomb, American officials launched a full-scale industrial effort to manufacture nuclear arms in time for use during World War II, which became what was known as the Manhattan Project. This effort culminated in the nuclear bombs used against the Japanese cities of Hiroshima and Nagasaki in August 1945.

The American program, which had derived considerable initial support and cooperation from the United Kingdom and Canada, was initially launched out of a fear that National Socialist Germany would develop its own nuclear arms. Even when it was discovered, by the end of 1944, that the German nuclear program was insubstantial, the fear of a nuclear-armed Soviet Union led officials on the Manhattan Project to pursue long-term counterproliferation strategies. Most significant of these was an attempt to secure the rights to all significant known deposits of uranium ore, the necessary raw material for any nuclear weapons program.

In the immediate postwar period, the threat of nuclear weapons proliferation and of a clandestine nuclear arms race motivated many scientists and

politicians in the United States to lobby for the international control of atomic energy. Specifically, it was held that the only way to avoid secret proliferation was for an international consortium to have authority over certain weapons-related activities, as well as provide for the inspection mechanisms necessary to verify that states were not creating contraband arms. Political conditions in both the United States and the Soviet Union prevented any workable control scheme from being realized during the 1940s.

The Soviet Union began developing its first nuclear arms out of a desire for security and parity with the United States. The USSR obtained considerable espionage information from the Manhattan Project by means of ideological volunteer spies well placed among scientific and diplomatic ranks. As such, Soviet officials had a reasonably complete picture of what the Manhattan Project efforts had been, and what had worked. It had been long assumed that this espionage information was instrumental to the speed of the development of the Soviet atomic bomb, but archival sources released after the end of the Cold War have shown that the Soviet administrators did not trust the data wholeheartedly and required their scientists to replicate it independently. The primary limiting factor for the development of the first Soviet plutonium bomb, detonated in August 1949, was the availability of raw materials.

Both the United Kingdom and France sought nuclear arms in the 1950s for similar reasons. Both were interested in independent deterrence against the Soviet Union, and both were motivated by the desire for international political and scientific prestige. The United Kingdom had the advantage of having played a significant role in the Manhattan Project, and it was able to draw on that experience to produce a relatively economical bomb by 1952. France had been a world leader in nuclear physics in the 1940s, had begun a serious reactor program by the mid-1950s, and detonated its first plutonium bomb in early 1960.

The People's Republic of China initially sought nuclear capability after confrontations with the United States over Taiwan and Korea in the 1950s, during which the possibility of American use of nuclear forces was publicly entertained by U.S. officials. Until the Sino-Soviet split, the Chinese were aided by Soviet technicians. By the early 1960s, however, they had become autonomous. In 1964, they detonated their first weapon: a comparatively

sophisticated implosion device fueled by enriched uranium.

It is of note that no state has yet been able to develop nuclear weapons without some form of international assistance, in the form of aid from foreign scientists, espionage, or the receipt of assistance in constructing specialized equipment or facilities. In some cases, this assistance from other nations has been involuntary, such as in the case of the United States and the Soviet Union, where the latter was the recipient of considerable information developed by the former, thanks to espionage. In other cases this assistance has been entirely voluntary, such as with France and Israel, where the former provided the latter with nuclear facilities largely out of the belief that a nuclear-armed Israel would aid in French foreign policy ambitions. An ambiguous middle ground exists in nations that received dual-use nuclear assistance and later diverted it toward clandestine nuclear programs. In all cases so far, however, it is worth emphasizing that nuclear proliferation has been an international effort.

Nonproliferation Regimes

The initial plan for the control of nuclear weapons, proposed by the United States to the United Nations in 1946, called for the eventual destruction of existing U.S. nuclear arms should other nations forswear developing them and submit to inspections verifying their renunciation. The Soviet Union, then working on its own clandestine nuclear program, could not be persuaded to submit to such a plan. In 1953, the U.S. president Dwight D. Eisenhower announced a program of "Atoms for Peace," meant to emphasize the sharing of nonmilitary nuclear technology with nonnuclear nations. This activity led to the creation of the International Atomic Energy Agency (IAEA) in 1958, with participation from the United States, the Soviet Union, France, and other nations. The Atoms for Peace program included the distribution of small quantities (not enough individually to produce a weapon) of highly enriched uranium for research reactor development.

In the early 1960s, as a result of increased experience with nuclear technology and the addition of the United Kingdom, France, and eventually China to the "nuclear club," the question of a general treaty to prevent further spread of military nuclear technology was raised repeatedly in the United Nations.

Political obstacles relating to the negotiation of nuclear weapon deployment in NATO states stalled negotiations until the end of the decade. In 1968, however, the United States, the Soviet Union, and the United Kingdom became the founding signatories to the Nuclear Non-Proliferation Treaty (NPT), which went into force in 1970. The NPT divided the world into "nuclear weapons states" and "non-nuclear weapons states," requiring that the states with preexisting nuclear stockpiles should not assist in the spread of nuclear weapons and that those without nuclear stockpiles would refrain from developing them. The treaty asserted that the "research, production and use of nuclear energy for peaceful purposes" was an "inalienable right" of all parties, providing that nonnuclear states submit their peaceful sites to inspections by the IAEA. The IAEA thus became the primary international agency charged with enforcing nuclear weapons safeguards and detecting the diversion of nuclear materials from peaceful purposes to military uses. Nearly all major states eventually became signatories to the NPT. France and China, both nuclear states at the time of initial treaty, did not initially sign, though France pledged to uphold its requirements. Both eventually signed the treaty in 1992 and are recognized as "nuclear weapons states" under the NPT.

Notably, a number of states did not sign the NPT. These included India, Pakistan, Israel, and South Africa. Though India had been a participant in NPT negotiations, it rejected the treaty on the grounds of maintaining sovereign military flexibility, especially in light of the Chinese development of nuclear weapons in 1964. Pakistan similarly rejected the treaty because of its rejection by the rival Indian state. India detonated a nuclear device in 1974, claiming it was a peaceful nuclear explosion and not weaponized. Pakistan similarly developed nuclear weapons capability of its own, with functioning warheads by the late 1980s. Both India and Pakistan detonated nuclear explosions in 1998, announcing themselves as fully nuclear states at that point.

It is widely believed that Israel developed nuclear weapons capability by the 1960s. The Israeli government has neither confirmed nor denied this accusation, despite compelling evidence for Israel's existing nuclear capabilities that has been either leaked or discerned by intelligence agencies. South Africa, initially a nonsigner of the NPT, developed a small arsenal of uranium-based weapons by the 1980s.

These were dismantled in the early 1990s, evidence was submitted to the IAEA, and South Africa became an NPT signatory in 1991.

Numerous other states pursued nuclear weapons research and development programs over the course of the Cold War. These included Argentina, Australia, Brazil, South Korea, Switzerland, and Taiwan, among others. For various reasons, both technical and political, these countries did not develop weapons. Furthermore, many of these nations are now members of various Nuclear-Weapons-Free Zones established by the United Nations since the late 1960s: The Treaty of Tlatelolco (1967) bans the development and basing of nuclear weapons in Latin and South America, the Treaty of Rarotonga establishes such a zone in the South Pacific, and the Treaty of Pelindaba (1996) prohibits nuclear arms in Africa.

Post-Cold War Developments

The end of the Cold War had decidedly mixed effects on existing nonproliferation regimes. There have been notable successes: the three former Soviet republics that had “inherited” nuclear weapons after the collapse of the USSR—Belarus, Kazakhstan, and Ukraine—all agreed to relinquish their stockpiles to the Russian Federation and become NPT signatories after negotiations with both Russia and the United States. On the other hand, however, numerous incidents have highlighted the possibility of NPT signatories purposefully evading IAEA inspections and successfully hiding clandestine nuclear programs until very late dates. Iraq managed to conceal a large nuclear program until just before the Gulf War in 1990; Iran has shown its ability to conceal the development of large nuclear sites from IAEA inspection regimes; and North Korea was able to pull out of the NPT entirely, seize formerly safeguarded facilities, and use them to develop nuclear arms in a relatively short amount of time.

The development of gas centrifuge technology, particularly in the late 1960s through the 1980s, has arguably created novel problems for nonproliferation efforts. Gas centrifuge enrichment of uranium is cheaper and requires less energy than other enrichment processes (e.g., gaseous diffusion or the electromagnetic method). Individual centrifuges are difficult to construct and operate, but the process itself can be done incrementally over time and in comparatively

small and hard-to-detect facilities. Centrifuges are also inherently dual-use: The same setup is used for both civilian and military purposes, and their coverage under the peaceful technologies permitted by the NPT is controversial. These facts raise a number of difficulties for nonproliferation regimes. First, they make clandestine enrichment programs increasingly feasible. Second, they allow for a rapid acceleration of civilian enrichment programs for military purposes. Third, their relative inexpensiveness and their inescapable connection with civilian enrichment make dissuading their use difficult.

The distribution of centrifuge enrichment technology was greatly aided by the Pakistani metallurgist Abdul Qadeer Khan. Khan first learned about the technology through working at a civilian enrichment facility in the Netherlands in the mid-1970s. He later took the blueprints back to Pakistan and developed the infrastructure for Pakistan’s nuclear weapons program. In the early 1990s, Khan began to covertly sell old Pakistani centrifuge technology and engaged an international network of suppliers to manufacture the parts. He sold the technology to Libya, Iran, and North Korea. Libya abandoned its nuclear program in 2003. North Korea has apparently pursued plutonium technology for its main nuclear program, and it detonated its first bomb in 2006. Controversy currently exists over whether Iran is actively pursuing nuclear weapons now.

The threat of nonstate actors acquiring nuclear weapons has been entertained seriously since at least the 1980s. The general conclusions reached are that a sufficiently well-organized and well-financed terrorist group could conceivably acquire and detonate nuclear weapons by means of acquiring fissile nuclear material from a preexisting nuclear state. Securing fissile material in existing states, in particular those in the former Soviet bloc, has hence been a major preoccupation of nonproliferation regimes. The Nunn-Lugar Cooperative Threat Reduction program, for example, begun by the United States in 1992, sought to upgrade critical nuclear infrastructure in the former Soviet states and to aid in deactivating and destroying weapons facilities.

NUREMBERG WAR CRIMES TRIALS

Between November 20, 1945, and October 1, 1946, an international court consisting of justices from each of the four Allied victors—the United States, Great Britain, France, and the USSR—prosecuted the most prominent surviving members of the defunct Nazi government in the war-shattered city of Nuremberg, Germany. Although the original indictment listed 24 defendants, three of the indicted were not present at trial. The industrialist Gustav Krupp von Bohlen und Halbach was deemed mentally unfit to stand trial; Martin Bormann, the head of the Nazi Party Chancery, was tried in absentia; and Robert Ley, chief of the German Labor Front, committed suicide after being indicted. These reductions left 21 defendants sitting in the dock at Nuremberg when the trial started. This entry discusses the background and proceedings of the trial and its verdicts and legacy.

Background to Nuremberg

The seeds of Nuremberg lay in the years 1942 and 1943, when the first reports of the Holocaust began

to leak out of occupied Poland. The Americans, British, and Soviets all issued warnings that the Nazis would be held judicially accountable for their crimes after the war. In October 1943, representatives of these countries met in Moscow to coordinate a common policy on German war crimes. They published a joint resolution, the “Moscow Declaration,” that limned an approach of returning lower ranking Germans suspected of war crimes to the countries in which they had committed them. The “major criminals,” whose crimes had “no particular geographical location,” would be “punished by a joint decision of the Government of the Allies.” What this “joint decision” consisted of in 1943 was unclear. Initially, the Americans, British, and Soviets all favored a policy of identifying the “grand criminals” and liquidating them by firing squad. U.S. Secretary of War Henry Stimson opposed summary execution, proposing instead to prosecute top Nazis in an international tribunal, where they would enjoy conventional legal rights like notification of the charge and the right to present evidence. By 1944, Stimson’s plan had bested summary execution. When Harry Truman became president in April 1945, he adopted Stimson’s plan as official U.S. policy. By June 1945, Great Britain, France, and the USSR had endorsed it.

In August 1945, the Allies set forth the crimes that would be charged against the Nazi defendants in a charter that would serve as the governing instrument of the international tribunal at Nuremberg. In Article 6, the “London Charter” listed aggression, war crimes, and crimes against humanity as the primary offenses. In addition, Article 6 indicated that the Nazis would be charged with “a Common Plan or Conspiracy” to perpetrate each of these crimes. Articles 9 and 10 authorized the tribunal to identify certain German agencies as “criminal” organizations. In accordance with the prosecution’s indictment, the tribunal would later declare the gestapo (the secret police of Nazi Germany), the *SS* (*Schutzstaffel*; the powerful elite guard of Nazi Germany), *SD* (*Sicherheitsdienst*; intelligence agency of the SS), and the leadership corps of the Nazi Party as criminal organizations.

In selecting defendants for trial, the Allies focused on the leading figures at the summit of the Nazi state—chiefly, men associated with propaganda, the armed forces, the Nazi Party, finance and industry, and slave labor. These included figures such as Julius Streicher, editor of the anti-Semitic newspaper *Der*

Stürmer; chief of army operations General Alfred Jodl; chief of staff of the high command General Wilhelm Keitel; chief of the air force Hermann Göring; the head of the Reich Security Main Office Ernst Kaltenbrunner; Hitler's deputy Rudolf Hess; minister of the Occupied Eastern Territories Alfred Rosenberg; and Albert Speer, minister of armaments and war production, to mention only a handful.

Notable Features of the Trial Proceedings

Several aspects of the year-long trial of the major war criminals are noteworthy. First, 90% of the prosecution's evidence relied exclusively on German government documents in the form of files, photographs, and films, an emphasis that lent an air of tedium

to the proceedings in the view of reporters covering the trial. Second, the indictment at Nuremberg not only closely tracked the offenses outlined in Article 6 of the London Charter but also included a charge of "common plan or conspiracy" to commit crimes against peace, war crimes, and crimes against humanity. Third, the trial was marked by curious tensions between the Soviets and the Anglo-Americans over how the USSR's territory would be defined in the aggression charge (the United States feared that including the Baltic states in the definition of Soviet territory would confer legitimacy on their annexation), and insistence by the Soviets that the indictment include the Katyn Forest massacre of 925 Polish officers, which the United States and Great Britain believed the Soviets had themselves perpetrated.

Nuremberg trials defendants.

Source: Office of the U.S. Chief of Counsel for the Prosecution of Axis Criminality (National Archives).

The Verdict of the International Military Tribunal

Although most of the defendants were convicted at Nuremberg, prosecutors did not enjoy an unblemished triumph. Contrary to their argument, the tribunal only recognized the existence of a conspiracy to wage aggressive war but not to commit war crimes and crimes against humanity. The tribunal also rejected the justiciability of crimes against humanity before September 1, 1939, on the grounds that such acts, because unrelated to waging aggressive war, were not prosecutable under international law. Three defendants were acquitted outright (Hjalmar Schacht, Franz von Papen, and Hans Fritzsche); most of the others were convicted on multiple charges. Twelve were sentenced to death and seven to prison terms of varying lengths (life to 10 years).

Impact and Legacy of Nuremberg

The Nuremberg War Crimes trial has exerted a profound influence on numerous proceedings and international legal instruments after the court adjourned in October 1946. The jurisprudence it created underpinned the Tokyo War Crimes trials and zonal trials conducted under Control Council Law #10. Nuremberg's painstaking documentation of the Holocaust led to passage of the UN Genocide

Convention (1948); the London Charter's tripartite classification of crimes against peace, war crimes, and crimes against humanity was incorporated into the Rome Statute of 1998 (establishing the International Criminal Court).

The legacy of Nuremberg is similarly polyvalent. The most far-reaching of its legacies may be the Nuremberg principles, which are now generally accepted as international customary law. These principles hold that perpetrators of genocide, crimes against humanity, war crimes, and aggression are criminally liable as individuals for their offenses, whether or not they were acting under the mantle of state authority.

OATH OF ENLISTMENT

Throughout history, oaths have bound loyal military forces to their leaders and nations. They remain today as a mechanism to ensure such allegiance. The military branches in the United States rely on an Oath of Enlistment for enlisted personnel and an Oath of Office for officers. Although it is common today, the notable difference between oaths concerns the armed forces' specific allegiance to the protection of the U.S. Constitution rather than a leader or political party. In contrast, the English and Canadian armed forces swear allegiance to their monarch. As a past example, Adolf Hitler in 1934 recommitted German military allegiance to himself directly when he replaced the prior oath to the German people and country. The history of the oath in the United States, discussed in this entry, serves as a window into the country's trials, challenges, and concerns for military loyalty dating back to the Revolutionary War.

Birth of the Oath and Revolutionary War

The first Oath of Enlistment in the United States of America was issued by the Continental Congress in June 1775 as a means of binding the men to the Continental Army. The oath was simple; it only required the soldiers to follow the regulations set down by the governing elements of the army during their service. A year later, in September 1776, the Continental Congress revised the oath under the newly formed Articles of War and incorporated some of the terminology that remains today.

The enlisted men swore to be "true to the United States of America" against its "enemies" and to obey the orders of the Continental Congress and officers above them. Those officers later followed an oath of their own.

Officers in the Continental Army recited the Oath of Office passed by the Continental Congress in October 1776. Officers acknowledged the sovereignty of the 13 United States and renounced any allegiance to King George III of Great Britain. They swore to "support, maintain, and defend" the United States against the King of Great Britain and concluded, "So help me God." A subsequent revision in 1778 consolidated the enumerated 13 United States as "the United States of America."

The 1789 revision of the Oath of Enlistment changed significantly from wartime versions in that it recognized the newly ratified Constitution. Although the body of the oath remained, an additional clause preceded it and recognized the importance of the armed forces in protecting the Constitution before everything else. Since 1789, the Constitution remains at the center of the oath as the characteristic that separates the U.S. military's obligations from those of many other nations around the world.

The Oath During the Civil War

After the 1789 revision of the Oath of Enlistment, it remained unchanged until the 1950s. Meanwhile, a revision to the Oath of Office for military officers during the Civil War addressed the need to confront allegiance to the Confederacy. The new version, sometimes called the Ironclad Test Oath of Office,

was passed in 1862 and sought to alleviate worries about officers' allegiance to the Confederate government. Under this oath, officers swore that they never aided or allied themselves with any office or government, especially within the country, that opposed the United States. Also, new to the officers was their affirmation to "support and defend the Constitution . . . against all enemies, foreign and domestic." Furthermore, they did so "without any mental reservation or purpose of evasion." At the time of its passage, the new oath confronted the problem of the Confederate secession and asserted a need for dedication and fortitude in a war that pitted soldiers on either side against their own family. Following the war, another revision in 1884 simplified the Oath once the conclusion of war eliminated concerns of officers with allegiance to the Confederacy.

Current Oaths of Enlistment and Office

The oaths remained untouched until the post-World War II years when a slight modification condensed and combined various past elements to make the current form that exists today. Similar to past versions, the focal point of the oath remains the sworn commitment to support and defend the Constitution against foreign and domestic enemies. Interestingly, enlisted soldiers pledge to obey the orders of the president, officers, and the Uniform Code of Military Justice, but the officers' oath excludes this component. This exclusion allows officers a degree of moral discretion in making a decision in the event that circumstances require a subjective evaluation not prefaced in the Uniform Code of Military Justice. Additionally, while the Oath of Office included the "So help me God" clause, it was not added to the Oath of Enlistment until 1950.

"I, _____, do solemnly swear (or affirm) that I will support and defend the Constitution of the United States against all enemies, foreign and domestic; that I will bear true faith and allegiance to the same; and that I will obey the orders of the President of the United States and the orders of the officers appointed over me, according to regulations and the Uniform Code of Military Justice. So help me God."

"I, _____ (SSAN), having been appointed an officer in the Army of the United States, as indicated above in the grade of _____ do solemnly swear (or affirm) that I will support and defend the Constitution of the United States against all enemies, foreign and domestic, that I will bear true faith and allegiance to the same;

that I take this obligation freely, without any mental reservations or purpose of evasion; and that I will well and faithfully discharge the duties of the office upon which I am about to enter; So help me God."

OCCUPATIONS

An American military occupation comes into effect once the U.S. military occupies and takes control over a foreign territory. According to The Hague Convention of 1907 and the U.S. Army Field Manual 27-10, territory comes under occupation when it is placed under the authority of occupation forces. Significantly, the occupation concerns only that territory where occupation forces can establish and exercise their authority. As a consequence, small mobile parties such as patrols or reconnaissance missions do not constitute occupation forces. Rather, an occupation must be undertaken by military units capable of controlling an occupied territory. That said, military occupation is meant to be temporary, though some 20th-century American occupations have lasted decades, such as in the case of Okinawa. In general, American occupations of foreign territories have been overseen by U.S. military governments, with the U.S. Army's Civil Affairs branch taking on a key role. Usually, the desired end of an occupation is the creation, or restoration, of a stable democratic state aligned with the United States. In the past several decades, for political reasons, the United States has avoided using the term *occupation*, resulting in some confusion distinguishing

between humanitarian interventions and occupations. This entry describes historical examples of American foreign military occupations as well as their particular characteristics and problems.

Overview of American Occupations of Foreign Territories

Though traditionally ignored by military professionals, who have focused on winning wars rather than on running occupations, the U.S. military has had long experience of conducting occupations in foreign territories, beginning during the Mexican-American War. Indeed, occupations that have involved civil affairs in occupied enemy territory are an inevitable consequence of war. That said, in many instances American service members have had little patience for postcombat routines, preferring demobilization to the boredom of occupation duty.

In retrospect, U.S. military occupations have had mixed results. Some, such as the post-World War II occupations of Austria, Germany, and Japan, arguably have been successful, though the causal connection between the implementation of American occupation policies and the subsequent development of democracies has been disputed. Nevertheless, American occupations have been credited with helping create states that respect the basic rights of their peoples and neighbors. Other occupations have had a poor record if judged against stated aims, such as the recent American occupation of Iraq. In the Iraqi case, U.S. occupation forces became bogged down by an insurgency even as the country devolved into a sectarian civil war. Also, the occupation of Iraq proved vastly more expensive from a financial standpoint than predicted beforehand.

In most cases, American occupations of foreign territories have lasted longer than the wars or combat operations that produced them. In many instances, occupation forces initially have faced a chaotic environment, especially following combat operations and the collapse of an enemy regime. As a consequence, during an occupation's early period and beyond, those living under occupation are dependent on American forces for law and order as well as for a host of necessities. In addition, the occupation force is bound by international law to provide security and relief, all with an eye to begin helping with the reconstruction of an occupied territory. In practice, however, American reconstruction attempts can be undermined, particularly by insurgents or

other lawless elements; the latter sometimes include those who are bent on settling scores about which American occupation forces may only have vague knowledge. As for insurgents, in many instances, they prove difficult to eliminate, as they play on popular resentments against foreign occupation as well as discontent created unintentionally or otherwise by the actions of American occupation forces.

In keeping with American democratic ideology, certainly since World War II, American occupations have included efforts to rebuild or even to create democratic institutions. Going hand in hand with such democratization efforts, American occupation forces have overseen the purging and punishing of defeated leaders and key followers of antidemocratic and militaristic political movements. Such purges, along with other attempts to right past wrongs, have hampered economic revival, though some argue that it is an inevitable price for justice. Unfortunately, in occupied territory once under dictatorships, many individuals needed from a technical standpoint to reconstruct a country have been compromised through their association, willing or otherwise, with the defeated regime. Also, purges breed resentment and even resistance on the part of former elites excluded from positions of prominence.

With the end of the Cold War, the objectives of American occupation forces have increased in terms of scope and complexity. Recently, several U.S. military occupations have provided humanitarian relief and taken on the financially costly task of "nation-building." The latter mission has necessitated juggling the desires and interests of various international organizations, "coalition partners," U.S. government agencies, and local entities. In addition, the U.S. democratization efforts have become more ambitious. Specifically, American occupation forces have attempted to help create stable democratic states, extend the rule of law, and instill respect for human rights in regions of the world that lack such traditions.

American Occupation of Mexican Territory

The first significant U.S. experience with foreign occupation duty came as a result of the Mexican-American War, especially during 1847–1848. Here, the United States employed a force of perhaps 30,000 to oversee thousands of square miles of northern and central Mexico and millions of Mexicans. In northern Mexico (excluding territory that later became part of the United States), occupation troops under General

Zachary Taylor initially consisted of Regular Army units. At first, American occupation forces represented a welcome change from corrupt Mexican soldiers. Soon, however, the introduction of American volunteers changed the situation in northern Mexico, with the new troops raiding Mexican farms and committing crimes against persons and property. As a result, the Mexican population increasingly supported what in more recent times would be labeled an insurgency. Making matters worse, Taylor's military governors operated according to their own rules, imperfectly improvised on the spot.

In central Mexico, the occupation ran somewhat more smoothly. General Winfield Scott consistently maintained military discipline over his men as well as law and order when it came to the Mexicans. In particular, he issued General Order No. 20 (February 19, 1847) to control the abuses of Mexicans perpetrated by American forces and to police Mexicans under his authority, though local Mexican authorities generally retained control over local affairs. The order allowed for the court-martial of Americans for crimes such as assault, rape, and murder. Perhaps most important from the standpoint of quieting the occupied population, the order also stipulated that American soldiers—including volunteers—would be punished if they desecrated Roman Catholic places of worship. In doing so, Scott contained a source of tension between the mainly Protestant volunteers and the Roman Catholic population of Mexico. He also made good the claim that American forces occupied Mexico not as enemies of the Mexican people or its Church but as enemies of a relatively small narrow group of men who had misgoverned the country. Significantly, Scott issued his order not only without guidance from the James K. Polk administration but also in the face of the president's reluctance for political reasons to sanction the discipline of volunteers serving in Mexico. Scott's approach proved more effective in protecting the Roman Catholic Church than Mexico's general Santa Anna's, who was known to confiscate Church property to support his war efforts. Scott was able to occupy Mexico City for several months but was only partly successful in limiting the activities of Mexican partisans.

Post-Spanish-American War Occupations

The next major U.S. occupation of foreign territory came in the wake of the Spanish-American War, with

American forces occupying formerly Spanish held territory such as the Philippines. Here, the United States mistakenly believed that the Filipino population wished to trade Spanish rule for American. As a result, U.S. occupation forces faced an insurgency for more than 3 years. During the period, General Elwell Otis seized ports in the Philippines, thereby controlling the valuable export of hemp. In doing so, however, he avoided harming the local interests that depended on the trade. In terms of reform, U.S. forces oversaw, rewrote, and simplified the Philippine tax code and legal system, eliminating centuries of cumbersome Spanish legal tradition. Finally, the American occupation helped establish local municipal governments. By the end of the occupation, however, a tragic price would be paid; more than 4,000 American soldiers and approximately 100,000 Filipinos were dead, many of the latter from disease and starvation.

In addition to the Philippines, the Spanish-American War brought Cuba under U.S. control. At least in the short run, the American occupation of Cuba proved relatively successful despite some Cuban dissent, with General Leonard Wood importing American practices grounded in the Progressive Movement. Specifically, Wood's occupation forces reformed and standardized the Cuban legal system, attempting to make it speedier and less corrupt. Also, the occupation instituted a number of public health measures, ranging from overseeing the nightly sweeping of the streets of Santiago to the constructing of new sewer systems to control yellow fever. Finally, occupation forces attempted to reconstitute Cuban schools along American lines and to break the power of monopolistic railway interests through regulation.

In the decade or so following the Spanish-American War, American forces increasingly intervened directly in the affairs of various Caribbean and Latin American countries, resulting in several occupations. To give examples, the U.S. Marines occupied Nicaragua beginning in 1909 and continued to do so intermittently until 1933. Also, American forces occupied Haiti from 1915 to 1934 and the Dominican Republic from 1916 to 1924. In part, American occupations in Latin America attempted to produce stable, pliant governments. More significant, the occupations were put into force to protect American economic interests and to prevent the expansion of European influence in the

region, particularly British and German. Years later, the United States again moved to deny an outside power from gaining influence in the region, briefly occupying the Caribbean island of Grenada after removing a pro-Soviet government from power.

American Occupation in the Rhineland

In the aftermath of World War I, American forces for the first time occupied territories far from the Caribbean, including territory in Europe. For instance, the U.S. Army occupied part of the German Rhineland (1918–1923). Without proper training or organization, American forces in the Rhineland were left to muddle through the occupation. To give one of a number of examples, American soldiers received orders to maintain “dignified aloofness” in their relations with the Germans. As some American occupation soldiers were billeted in German homes, such an order proved impossible to enforce. Unfortunately, in this particular instance, the army failed to learn from its Rhineland experience. Immediately following World War II, in Germany, the U.S. Army attempted to impose a “nonfraternization” policy on its troops, which forbade American soldiers from even talking with German civilians. As in the post–World War I case, American soldiers violated the order to such a degree that it proved unenforceable, particularly as it initially was forbidden even to talk with small children. Ironically, in the Rhineland following the Great War, American occupation forces had far more trouble in their dealings with French occupation forces, and to some extent the British, than with the defeated Germans. For instance, the French and the British attempted to convince the American general John J. Pershing that he must impose harsh regulations on the occupied Germans, lest they favor the Americans at the expense of their fellow occupiers, the French and the British. Also, the French covertly used agents to foster a separatist movement in the Rhineland, including in the American bridgehead at Coblenz. Pershing had to go as far as to threaten to withdraw American forces from the occupation to bring an end to French activity. Despite the problems of the Rhineland occupation, the U.S. Army learned from the experience, drawing on it during the next World War as part of the training in various schools for military government established in the United States and abroad.

American Occupations During and Following World War II

During and following World War II, the United States found itself militarily occupying foreign territory in yet even more distant corners of the globe. For instance, during the war, American forces occupied territory in North Africa and Italy. After the war’s end, the United States occupied the whole of Japan and Korea south of the 38th parallel. Also, the United States established, along with the other Allied powers, occupation zones in Austria and Germany. With the postwar occupations came many responsibilities; some of the more important included the following: to restore and maintain public safety, to secure and provide adequate food and fuel supplies, to reform and reopen public and private institutions such as schools and factories, to repatriate persons to their country of origin, and to provide for protection of occupation forces. Generally speaking, the post–World War II American occupations did not lack for planning, though Korea was an exception.

In the cases of the U.S. Zones in Germany and Austria, American forces attempted to transform society. In Germany, according to American policy, General Lucius D. Clay, as commander of the U.S. military government, conducted a policy of demilitarization, decartelization, denazification, and democratization. To put it another way, American occupation forces, in concert with the other Allied powers, were charged with disarming Germany, breaking up its monopolistic industries, punishing Nazis and eliminating Nazi influence from society, and, finally, creating a democracy. In practice, such objectives proved contradictory. For instance, attempts to denazify Germany ran counter to attempts to revive Germany with a sound economy; the latter goal Clay ultimately favored and thought necessary for democracy to thrive. Also, postwar demobilization and the lack of personnel with adequate understanding of the German language undermined American efforts. Finally, the denazification of the German population, which involved sorting and judging millions of people, simply proved beyond the capability of the U.S. Army. Despite such problems, the Germans did not mount an armed resistance, making the occupation a peaceful affair. In any case, the U.S. military government in Germany soon had to concern itself

with an increasingly aggressive Soviet Union bent on extracting wealth from Germany.

Post-1989 American Occupations

Since 1989, U.S. forces have taken part in occupations in Panama, the Balkans, and Iraq. In the case of Panama, the United States intervened to remove an uncooperative dictator. Unfortunately, in contrast to its combat operation for Panama, the U.S. military proved reluctant to plan in detail for the mainly postcombat “stability operation” known as Operation Promote Liberty. Complicating matters, Operation Promote Liberty, when put into practice, overlapped by several weeks the combat operation used to depose the country’s leader, leading to confusion on the ground. To give an example, American occupation forces had only a single military police battalion to deal with the general breakdown of law and order. In the aftermath of combat, and in an effort to remove the influence of Panama’s military, American occupation forces found that U.S. law did not easily allow them to oversee the creation of a national police in Panama.

In the 1990s, the U.S. military demonstrated increased reluctance to engage in the complex problems of occupations. In the wake of the Persian Gulf War, the American occupations could be brief, such as in Kuwait, or coupled with humanitarian efforts, such as in northern Iraq. In addition, Washington’s position could be to deny that an occupation existed, as happened in the Haiti occupation. In yet other cases, American forces participated in occupations as part of multinational peace efforts, as in Bosnia and Kosovo. In the Balkan cases, American forces provided security in territories under international occupation, as well as helped clear mine fields, control unruly crowds, protect refugees, and round up suspected human rights violators. Even further removed from traditional military affairs, American occupation forces had to maintain working relations with various international organizations, non-governmental organizations, and foreign military occupation contingents. Over time, American forces found that the international and local political situations changed. As a result, to give an example, in Bosnia, American occupation forces began their occupation by standing between different factions and demobilizing hostile forces.

Later, they took part in forcibly imposing a truce on all the various groups in the territory.

In the case of Iraq in 2003 and later, the military occupation proved particularly difficult, thanks to a host of problems. One problem was the nature of Iraq itself. Following World War I, the British had established Iraq by force, melding together various antagonistic clans, tribes, and sects. In addition, throughout its history, Iraq had been ruled by authoritarian leaders, with Saddam Hussein being the last and the most heavy-handed. Making matters worse, the UN economic sanctions in the aftermath of the Persian Gulf War of 1991, in crippling Iraq’s middle class, had the unintended consequence of strengthening Hussein and his Baath party.

In addition, the United States prior to the war with Iraq officially refused to acknowledge that American forces would inevitably occupy Iraq, preferring instead to speak of liberation. Taking such a view, the Pentagon leadership failed to commit adequate numbers of soldiers for an initial occupation, despite the warnings of military officers who had studied previous occupations. Also, the uncontrolled disintegration of the Iraqi army ensured that large numbers of young men with at least a degree of military training and access to weapons were at large in the country. With time on their hands, these former Iraqi soldiers provided prime candidates for the subsequent insurgency. The situation in Iraq following hostilities was in sharp contrast to postwar Germany, where most German males were dead, wounded, prisoners of war, or incapable of armed resistance. Ultimately, the United States did acknowledge that Iraq was occupied and created the Coalition Provisional Authority that lasted from April 2003 through June 2004. By the time the Coalition Provisional Authority was established, however, American occupation forces had other problems, ranging from the lack of translators to the inability to provide adequate electricity to Baghdad, all of which suggested that military occupations are not to be undertaken lightly.

OFFICER CANDIDATE SCHOOL

Officer Candidate School (OCS) is one of several commissioning programs run by each branch of the military through which selected candidates earn a commission as a second lieutenant in the U.S. Army, U.S. Marine Corps, or U.S. Air Force, or as an ensign in the U.S. Navy or Coast Guard. Courses run from 6 to 17 weeks straight, depending on the branch, or as long as 16 months, if taken through the Army National Guard. The course at OCS is usually intense, with classroom instruction, physical fitness, field training, and leadership training held under highly regimented conditions. The background of candidates has varied during different periods and in different branches of the military. Some candidates

enter OCS with substantial enlisted service, while others are admitted with no previous military experience. In general, most candidates possess a bachelor's degree, although depending on the need for officers, that requirement has been lowered and even dropped entirely. The OCS concept remains to take candidates with demonstrated potential to serve as officers and put them through an intense training program that will enable graduates to perform the duties of a junior officer. The training is purposefully stressful, providing an opportunity for instructors to observe candidates in difficult situations and remove those deemed unlikely to succeed as officers. Almost all graduates of OCS receive a reserve commission, although many remain on active duty after commissioning and completion of branch-specific training. This entry discusses the history, programs, and role of OCSs, and the impact of the Global War on Terrorism.

History

OCSs are a product of early-20th-century military reforms, specifically over the problem of rapidly expanding the traditionally small peacetime U.S. Army for major wars. The Civil War and Spanish-American War demonstrated the drawbacks of relying on volunteer officers commissioned directly from civilian life to command military forces. OCSs evolved from General Leonard Wood's Citizen Military Training Camps, called Plattsburg Camps after the initial site, which were geared toward graduates from elite civilian universities. Wood believed that while the average American man might take years of training to become an effective officer, men from elite colleges could become effective officers through much shorter yet intense training. Under the initial program, men who had recently completed college would spend 4 or more weeks training in military tasks, after which top graduates were offered provisional commissions, although few would be offered tours on active duty with the Regular Army. Most who accepted the commissions served in either the National Guard or in the Officers Reserve Corps, which was created in 1916 and functioned mainly as a list of reserve officers.

In the National Guard, officers were normally voted into office by the enlisted men in a company, but reforms at the beginning of the 20th century ended this practice. In most states, enlisted men

seeking commissions were encouraged to take a series of correspondence courses offered by the army in order to qualify. The Massachusetts Volunteer Militia took a more direct approach to prepare future officers in 1913 when it established a training school—what would later be called an OCS—as a source of National Guard officers. Graduates were placed on the statewide list of those eligible for commissions in the National Guard and were commissioned as vacancies occurred. The school was suspended when the United States entered World War I but reopened in 1927. Current OCSs run by the Army National Guard trace back to the Massachusetts school.

When the United States entered World War I, the greatly expanded armed forces needed far more officers, especially in the company grades (lieutenants and captains), than the National Guard or the tiny Officers Reserve Corps could provide. As a result, all branches of the military developed OCSs, usually lasting 3 months, for enlisted men who showed the potential to become officers. The military sought men who because of their educational background had potential to serve as officers, rather than selecting men who showed a mastery of military skills. Within each branch of the military, most OCSs were branch specific, meaning that the infantry, artillery, and support services each maintained its own OCS. Graduates of these OCSs received reserve commissions. After the war, the mass of new officers were discharged; very few were able to convert their reserve commissions into regular commissions for service in the peacetime military. If the discharged officers desired, they could preserve their reserve commissions by joining the Organized Reserve or National Guard. The OCSs were all closed, and except for a few states, National Guard programs would not be restarted until shortly before the United States entered World War II.

However, hoping to provide a source of officers for the Organized Reserve, the army began holding Citizens' Military Training Camps, which were based on the prewar Plattsburg model. A series of summer camps were held around the country, mainly targeting college men, but some with businessmen who had been out of college several years. The main purpose was to acquaint civilians with the rudiments of military life rather than as a commissioning program, although men who

completed three or four camps, depending on the period, and later, a correspondence course, could earn a reserve commission through the camps. By the 1930s, fewer than 10% of the men who started a camp completed the entire process and earned a commission, but those who did, such as Ronald Reagan, usually entered the Organized Reserve, and most would later be called to active service in World War II.

When the United States began mobilizing in the fall of 1940, the National Guard and the Organized Reserve did not have nearly enough officers for their own organizations, much less enough to provide for the greatly expanded military being planned. As a result, OCSs were again held at various training camps around the nation and in all branches of the military. The need for company grade officers became so acute that divisions held their own OCS programs, including one in Australia by the Americal Division. OCSs provided the majority of company grade officers during the war. However, as with their World War I forebears, most World War II OCS graduates left the military after the war.

During the Korean War, the army maintained eight branch-specific OCSs and lengthened the course from 17 to 22 weeks. Slightly more than a third of candidates failed to complete the course. Eventually, around 7,000 officers graduated from an army OCS during the war. After the Korean War, OCSs became a permanent fixture of the U.S. military, although reduced from eight to three programs, one each for infantry, artillery, and engineers. OCS rapidly expanded again during the Vietnam War. It was lengthened to a 23-week-long program and experienced a high failure rate. The infantry OCS at Fort Benning, Georgia, graduated 7,000 officers annually in the mid- to late 1960s. During peacetime, OCSs remained small, with few classes held. In 1973, all army OCS programs were consolidated at Fort Benning in the Branch Immaterial Officer Candidate Course, which was largely based on the infantry program.

Role of OCS

While the Reserve Officers' Training Corps (ROTC) remains the largest source of officers, OCSs allowed the military to take advantage of potential officers who had not attended a military academy or served in ROTC, but without the risky former practice of

commissioning such men directly from civilian life. The existence of OCSs gave aspiring enlisted men a method of entering the officer ranks. The existence of OCSs also gave the military greater flexibility in filling its lower officer ranks, especially during wartime. While a military academy took 4 years to commission an officer, and ROTC took at least 2 years, OCS could produce officers in 3 months. Additionally, commissioning an officer through OCS cost the army about one tenth of what was required for an academy graduate.

Global War on Terrorism

The 1990–1991 Persian Gulf War had little impact on OCSs due to the short and decisive nature of the war and the decreasing size of the military following the end of the Cold War. While not totally discontinued during the 1990s, OCSs shrank and functioned more as a hedge against a future need for rapid expansion rather than as a large source of officers. The Global War on Terrorism that began following the attacks of September 11, 2001, led to the expansions of OCSs, especially the army's at Fort Benning. While the military itself expanded only slightly during the war, the need for company-grade officers increased dramatically to fill shortages caused by lower retention rates and a decline in officers commissioned through the ROTC.

The army's OCS is currently a 14-week program. Candidates are either serving enlisted soldiers recommended by their chain of command, or individuals with no prior military service, who must attend basic combat training with other enlisted soldiers before beginning OCS. Army OCS, along with the Military Academy and ROTC, is currently considered the Basic Officer Leadership Course, Phase I. Phase II is a 7-week course in basic infantry tactics, and Phase III is the branch-specific school. The army expanded its OCS almost every year during the first decade of the Global War on Terrorism. In 2000, 484 officers were commissioned through OCS. By 2002, that number had risen to 1,003. In 2006, approximately 1,420 new second lieutenants entered active duty through the army's OCS. However, that number probably represents the peak that the army can commission through OCS in its current facilities. During the same period, the number of new officers commissioned through the academy remained stable, and ROTC peaked in 2004, with 4,408 new

officers, and declined afterward. OCS currently provides between a quarter and a third of all new officers in the active army.

Other OCS and OTS Programs

The Army National Guard in each state also operates an OCS. National Guard OCSs follow the course of instruction of the Fort Benning OCS and must be accredited by the army's Infantry School. The National Guard OCS operates on a 16-month schedule at their state's military academy, normally beginning in the spring with training 1 weekend a month, including two 2-week-long active-duty periods and monthly weekend trainings in between. Depending on the need for officers, the National Guard also sometimes holds regional 8-week OCS programs. Graduates of National Guard programs earned two commissions, a reserve commission in the U.S. Army and a state commission. State OCSs continue to be a major source of new National Guard officers.

The Air Force Officers Training School (OTS) traces its origins to World War II OCS programs for aviation cadets. The air force maintained two programs in the 1950s, with OCS for former enlisted airmen and OTS for candidates from civilian life. In 1963, OCS was ended, and most aspiring officers who had not completed ROTC or the academy had to attend OTS. OTS was held on Lackland Air Force Base, San Antonio, Texas, until the 1990s, when it moved to Maxwell Air Force Base, Alabama. The Air National Guard maintains its own resident OTS called the Academy of Military Sciences. The Academy of Military Sciences was long held on McGhee Tyson Air National Guard Base, in Tennessee, but moved to Maxwell Air Force Base in 2009. While the active-duty air force OTS is 10 weeks, the Air National Guard version lasts only 6 weeks on the theory that most Air Guard candidates have prior enlisted service.

The U.S. Navy currently holds its OCS as a 12-week course at Naval Station Newport, Rhode Island. The navy had two OCS programs, one for aviation candidates at Naval Air Station Pensacola, Florida, and the other in Newport for all other specialties. In 1994, the Newport OCS closed and the OCS at Pensacola became a single-track course. In 2007, the entire OCS program moved back to Newport. The Marine Corps OCS, held at Marine

Corps Base Quantico, Virginia, is the most comprehensive OCS program. All potential marine officers, except Naval Academy graduates, attend OCS in the Platoon Leaders Class or the Officer Candidate Class for either two 6-week periods or one 10-week period. Graduates of Naval ROTC with Marine Option attend OCS for 6 weeks prior to commissioning. The Coast Guard holds its 17-week-long OCS at the Coast Guard Academy in New London, Connecticut, making that installation the source of almost all new Coast Guard officers. Until 1998, the Coast Guard OCS was located at the Coast Guard Reserve Training Center in Yorktown, Virginia.

OFFICER CAREER FIELDS

Commissioned officers are military leaders who have earned a commission from the U.S. Congress. There are four paths available to earn a commission: the federal military academies, the Reserve Officers' Training Corps (ROTC) program, Officer Candidate Schools (OCSs), or direct appointment. The United States Military Academy, the United States Naval Academy, and the United States Air Force Academy are the three federal military academies. The ROTC is a program of instruction offered by universities. Each service branch runs an OCS for selected high-quality enlisted personnel. Direct appointments are relatively rare and typically apply to medical specialists such as dentists or surgeons. Congress approves

commissions into the appropriate branch of service for individuals who complete any of these programs. The academies and ROTC typically commission cadets in June and December, while OCS commissions multiple times a year as trainees complete the program. A direct commission is an individual process that may occur at any time. Each officer earns a commission into a specific career field. As officers progress through their career fields, they may have opportunities to transfer into another field depending on the requirements of their service branch. This entry describes the officer career fields available in four branches of the U.S. military.

U.S. Army

The U.S. Army has 16 basic branches organized under three broad career fields. The 16 basic branches are the following: (1) infantry, (2) aviation, (3) armor, (4) engineer, (5) military police, (6) chemical, (7) field artillery, (8) air defense artillery, (9) signal, (10) military intelligence, (11) transportation, (12) ordnance, (13) quartermaster, (14) adjutant general, (15) finance, and (16) medical service. The army groups these fields under Maneuver, Fires, and Effects; Operations Support Division; and Force Sustainment Division.

Officers commission into one of the 16 basic branches, usually serving in that branch until their initial term of service expires when they may apply to change their basic branch. The army augments the Maneuver, Fires, and Effects, and the Operations Support Division groups with specially trained Functional Area officers. There are currently 14 Functional Areas: (1) information operations, (2) public affairs, (3) telecommunication systems engineer, (4) information systems engineer, (5) strategic intelligence, (6) foreign area officers, (7) electronic warfare, (8) space operations, (9) academy professor, (10) operations research and systems analysis, (11) force management, (12) nuclear and counterproliferation, (13) simulations operations, and (14) strategist. Typically, officers apply for positions in the Functional Areas through a centralized board selection process at the seventh year of service.

U.S. Navy

The United States Naval Academy and Navy ROTC program commission midshipmen into the U.S. Navy (USN) or the U.S. Marine Corps (USMC). Those that commission into the USN become

ensigns and may serve in a broad variety of assignments grouped in six career fields. The USN has surface warfare officers, aviators, flight officers, submariners, explosive ordnance disposal officers, and special warfare officers.

All USN officers are required to attain specific qualifications to progress within their career fields. Surface warfare ensigns attain the necessary qualifications through a combination of shipboard on-the-job training and institutional training at the Surface Warfare Officers School Command in Newport, Rhode Island. Aviators attend flight school after commissioning and progress to primary training at one of three locations where the USN assigns them to specific aircraft types. Pilots receive further training for their specific aircrafts at various locations before serving in Fleet Squadrons. Flight officers progress in a similar manner to aviators; however, flight officers train to operate aircraft systems rather than pilot them. Submariners attend an advanced nuclear training course and the Submarine Officer Basic Course before serving on a submarine. Explosive ordnance officers serve in a joint capacity with officers of the other service branches and specialize in safe handling and destruction of explosive devices. Finally, special warfare officers become experts in unconventional warfare techniques. This field includes the Sea, Air, Land and Special Warfare Combatant Craft crewman programs.

U.S. Marine Corps

The USMC groups 20 officer career fields in three broad categories. The Ground category includes adjutant, armor, artillery, aviation command and control, aviation maintenance, aviation supply, combat engineer, communications, financial management, ground supply, infantry, intelligence, logistics, military police, and public affairs. Fixed-wing pilot, rotary-wing pilot, tilt-rotor pilot, and naval flight officer fall under the Air category. The third category, Law, has judge advocate as its only specialty.

The USMC uses an officer selection officer in the recruiting process to screen and identify candidates for commissioning. The officer selection officer helps candidates decide for themselves which commissioning path is best. In addition to the Naval Academy, Marine-option Naval ROTC and OCS candidates may attend the Platoon Leaders Class or Officer Candidate Course as alternative methods of attending OCS. The Platoon Leaders Class is available to college freshmen, sophomores, and juniors as a

summer training course, while the Officer Candidate Course provides a 10-week fast-track course for seniors or graduates. The USMC conducts both courses at Quantico, Virginia.

U.S. Air Force

The U.S. Air Force groups its officer career fields into four categories. The Flight category includes air battle manager, combat systems officer, and pilot. The Technical category includes acquisition manager, civil engineer, developmental engineer, scientist, and weather officer. The U.S. Air Force's nontechnical group is the largest and includes positions in aircraft maintenance, combat rescue, command and control, cyberspace operations, contracting, cost analysis, financial management, intelligence, logistics, logistics readiness, munitions and missile maintenance, personnel and manpower, planning and programming, public affairs, readiness, security forces, services, space and missile operations, and special investigations. The Specialty category includes air liaison, band, chaplain, and judge advocate. Finally, the U.S. Air Force also includes a wide range of professional medical specialties.

OODA (OBSERVE, ORIENT, DECIDE, AND ACT)

OODA (observe, orient, decide, and act) refers to a model of combat decision making formulated and popularized by John Boyd (1927–1997), former U.S. Air Force fighter pilot and influential American military thinker. Boyd theorized that adversaries in conflict *observe* the world, incorporate their observations

into a more general *orientation*, make *decisions*, and then translate their decisions into *actions*, the results of which feed back into the cycle, which repeats until the engagement ends. This model, also known as an “OODA loop” or a “Boyd cycle,” is popularly associated with the idea that a decisive advantage will accrue to the combatant who can go through the steps more rapidly over the course of successive decision cycles. However, recent scholarship has emphasized a much more complex interpretation of OODA as a wider-ranging theory with much broader implications. This entry discusses the origins of the OODA model and then describes the basic and the expanded loop models.

Origins

The OODA model has its roots in Boyd’s experiences as a fighter pilot during the Korean War and in a series of analyses he carried out later, first as a fighter tactics instructor and then as a consultant on the design of fighter aircraft. Unlike many of his contemporaries, Boyd theorized that tactical superiority for fighter planes was associated with maneuverability and agility, rather than with such straightforward variables as the aircraft’s speed, acceleration, and range. More maneuverable and agile planes, argued Boyd, enabled pilots to generate a fast-changing tactical situation for their adversaries, allowing them to dictate the terms and tempo of the engagement and ultimately leaving their adversaries unable to respond effectively. Boyd came to believe that this general pattern applied not only to air-to-air combat but also to other types of military conflict as well. Boyd’s ideas had direct influence on the development of the F-15 and F-16 fighter planes.

After retiring from the U.S. Air Force in 1975, Boyd continued to develop his ideas about air-to-air combat into a more general theory of armed conflict. Boyd conducted extensive research on ground warfare, military history, command and control, and organizational learning. He publicized his ideas within the American military community in a series of slide presentations, which he delivered many times over the course of the next several years. In these presentations, Boyd expanded the scope of his ideas and placed them into a larger intellectual context that incorporated insights from physics, biology, mathematics, psychology, and systems theory, as well as military history and military theory.

The Basic and Expanded OODA Loop Models

The most widely recognized image of the OODA loop models’ conflict is a simple competitive four-step decision cycle, which both participants in a confrontation—for example, fighter pilots or military unit commanders—go through over and over (Figure 1). Although it is thought to emphasize the importance of time and tempo, Boyd himself also emphasized the importance of maintaining orientation under conditions of menace and uncertainty, as well as the importance of using deception and ambiguity to affect the adversary’s orientation. For Boyd, operating “inside the adversary’s decision cycle” implies not merely going through the cycle faster but maintaining superior orientation about the developing situation.

This basic model, though well known, falls far short of expressing the full range of Boyd’s ideas. Boyd’s own OODA loop is much more complex, applying not just to individuals and small tactical units but also to larger organizations (up to and including the nation-state), to different levels of warfare (including the tactical, operational, strategic, and grand-strategic levels), and to different kinds of conflict (including guerrilla warfare and, arguably, even peacetime). It takes into account not merely the moment-to-moment situation but also the longer decision cycles associated with large-scale organizational decision making (Figure 2). For large organizations, Boyd argues, the four steps can and often do take place simultaneously and tacitly, rather than in order and explicitly. In addition, feedback into

Figure 1 Simple or Basic OODA (Observe, Orient, Decide, and Act) Loop: The OODA Loop in Its Most Widely Recognized Form

observation and orientation comes from both the decision and action steps, rather than just from the action step. Although simple “rapid OODA looping” continues to take place, particularly at the lower levels of the organization, fast decision cycles at the lower levels must remain consistent with overall organizational cohesion.

The OODA model has important implications for training and for military command and control. Most important, it implies that military organizations must allow subordinate units freedom to seek out and exploit temporary advantages within an overall scheme that achieves the commander’s intent. This requires commonality of vision throughout the organization and places a premium on the exercise of initiative by subordinate unit commanders.

Applications

Boyd’s work provides much of the foundation for the contemporary *maneuver warfare* school. As such, it is one of the key sources for current American military doctrine, particularly for the U.S. Army and

the U.S. Marine Corps. Boyd had particular influence on the army’s Field Manual 100-5 *Operations* (1982), which laid out the original concept for AirLand Battle, and continues to be a central touchstone of the Marine Corps’ current doctrinal manuals, especially *MCDP-1 Warfighting* and *MCDP-6 Command and Control*. The OODA concept is also considered to have wide applicability to many other competitive domains, including the business world.

OPERATIONS, AIR

The basic tenets of contemporary air operations were founded during the interwar years. After the Cold War, both the operational environment and the significance of air operations changed; for the risk- and casualty-averse militaries of the post-Cold War era, technological advancements in munitions and targeting have helped air forces become the first choice in humanitarian interventions and an integral aspect of military interventions and counterinsurgency operations of the post-9/11 period. This entry discusses types of air operations and their effectiveness.

Types of Air Operations

Air superiority represents the central role for air forces. The term refers to control over airspace of the operational area in which friendly forces are operating, thereby denying the adversary the opportunity to attack friendly forces by air. It provides safe operational space for other friendly air operations. In the post-Cold War environment, air superiority operations were conducted to establish no-fly zones, mostly against weak adversaries such as Iraq and Libya. Most of these military operations have been conducted in noncontested airspace.

Bombing, both tactical and strategic, forms another important aspect of air operations. The former targets enemy ground forces beyond the reach of friendly forces, while the latter focuses on breaking the adversaries' will by targeting the leadership and significant war-related assets deep in enemy territory, provided that the adversary is a state. Close air support—related to tactical bombing—provides aid to friendly ground forces by targeting nearby adversaries. In close air support operations, air forces are used as flying artillery, providing fire support where needed by ground forces. Interdiction, focused on disrupting adversaries' movement by targeting command, control, and communication systems; supply

routes; and infrastructure, has become less relevant in the post-Cold War environment. For example, in the 2003 Iraq War, U.S. forces attempted to keep Iraqi infrastructure intact for the postconflict use of friendly forces.

Strategic airlifts have become an integral aspect of military air operations during the past half century, carrying both troops and equipment to and from areas in which the use of civilian aircraft is dangerous. Airlifts can supply troops with critical supplies and can also carry special forces deep into enemy territory to conduct surgical strikes and evacuate wounded soldiers from battle.

Despite the advancement of satellite imagery, air force reconnaissance operations continue to represent an important asset in target acquisition in the post-Cold War environment. Although reconnaissance operations were largely conducted by manned aircrafts during the 1991 Persian Gulf War—specifically in the search of Iraq's Scud missile launchers—in the years since, conflict unmanned aerial vehicles have played an increasingly central role, specifically in operations in Afghanistan, Iraq, and Libya.

Effectiveness of Air Operations

Post-Cold War air operations have yielded mixed results. The 1991 Persian Gulf War represented a turning point for the use of air forces in contemporary conflicts. The lesson drawn from the success of coalition air forces' destruction of Iraqi forces, which rendered the ground invasion largely unnecessary, is that air forces alone are capable of putting hostilities to an end, without the need for ground forces. Although air power proponents had made such an argument for decades—all the way back to the U.S. general William Mitchell's advocacy in the 1920s—maturing munitions technologies, such as precision-guided munitions and Joint Direct Attack Munition, improved targeting systems that enabled precision strikes day and night and all-weather capabilities, including the increasing use of unmanned aerial vehicles for both reconnaissance and attack enabled air forces to inflict more damage on the adversary faster more comprehensively. Furthermore, better technologies enable contemporary air forces to operate at higher altitudes, providing a safer operational area and less risk of attack from the ground.

In the risk- and casualty-averse environment of the post-Cold War era, with decreasing military budgets

and troop levels, the use of air forces has become an increasingly attractive option politically. Air forces were utilized in the humanitarian intervention in Bosnia and Herzegovina first by helping Sarajevo survive the Bosnian Serbs' siege of that city through a strategic airlift, in addition to the UN-sanctioned establishment of a no-fly zone. Second, in August 1995, the North Atlantic Treaty Organization (NATO) initiated a month-long bombing campaign to coerce Bosnian Serbs to end hostilities. Air units undertook similar actions in the Kosovo conflict in 1999. NATO air forces attacked Serbian forces in Kosovo and initiated a strategic bombing campaign in Serbia to end the hostilities in Kosovo and force Serbian forces to withdraw. Air forces are also used as a force multiplier, allowing combatants to enter a conflict with small numbers of friendly ground forces, as in the Iraq War in 2003, or tipping the balance of power without committing any ground forces, as in Afghanistan and more recently Libya in 2011.

Skeptics of air power, however, argue that the high reliance on air forces has limited allied success in contemporary conflicts. The effectiveness of air forces, as the argument goes, depends on factors that

could negate air forces' technological capabilities. While air forces are highly effective in engaging concentrated enemy groups, their effectiveness decreases significantly when the adversary disperses and uses camouflage. In addition, geography is an important factor affecting the effectiveness of air operations. While air forces perform well in areas with clear sight lines like deserts, mountainous areas or dense jungle decreases their effectiveness. Furthermore, it is argued that the coercive power of tactical and strategic bombing is questionable. During the Kosovo War, for example, after-operation evaluations suggested that the damage NATO air forces inflicted on Serbian forces was significantly less than NATO estimates during the campaign. Moreover, air operations failed to prevent Serbian operations in Kosovo and did not force the Serbian government to end hostilities as quickly as was hoped.

Skeptics of air power also argue that the heavy reliance on air forces in contemporary conflicts negatively affects operations on the ground. For instance, they suggest that the small number of troops committed in the Iraq War in 2003 represents one of the main causes of postconflict hostilities, as there were

U.S. Army private first class Christopher Cannon with 2nd Battalion, 5th Cavalry Regiment (2-5 Cavalry), 1st brigade combat team, and 1st Cavalry Division, launches an unmanned aerial vehicle called the Raven to provide an aerial view of the area in support of the Iraqi army. Soldiers from 2-5 Cavalry provided security, while Iraqi soldiers searched the area surrounding Joint Security Station UR, in Baghdad, Iraq, June 22, 2009.

not enough “boots on the ground” to contain dissidents and secure critical arms depots. Similarly, the escape of high-ranking Taliban and al Qaeda leaders from Afghanistan was seen as reflective of the lack of sufficient troops on the ground. In conclusion, the debate about the effectiveness and the use of air forces in contemporary conflicts will persist, while air forces continue to be deployed as a spearhead.

OPERATIONS, COLD-WEATHER

Of the many possible weather and terrain environments for military operations, cold-weather environments must rank as the most inhospitable to forces and to humans in general. Throughout the history of warfare, cold weather stands out as a critical determinant of military success, equal and in some cases surpassing the importance of enemy forces. Cold weather has affected the fates of ancient armies, like those of Hannibal, and armed forces performing current operations, like the multinational forces engaged in Operation Anaconda in Afghanistan in 2002. With the increasing national competition for Arctic resources and transportation routes in the 21st century, it seems likely that cold weather will

continue to play a decisive role in military operations into the foreseeable future. This entry defines cold-weather conditions and examines their effects, then discusses the history and challenges of cold-weather operations.

What Defines Cold Weather

Cold-weather conditions are defined by temperature and humidity. Typically, the U.S. Army considers areas of 40° latitude and higher to be regions where cold-weather operations can occur. In the Northern Hemisphere, these regions encompass most of the continents of Europe, North America, and the subcontinent of Eurasia. The extent of land areas in the Southern Hemisphere that are within these regions is limited to Chile and Argentina on the South American continent, the most southern portions of Africa, and southern Australia and New Zealand. The U.S. Marine Corps, following the example of the Norwegian armed forces, divides cold weather into four bands: “wet cold” (40° to 20° F/-4° to -6.5° C); “dry cold” (20° to -5° F/-7° to -21° C); “intense cold” (-5° to -25° F/-21° to -32° C); and “extreme cold” (below -25° F/-32° C). Terrain comes into play at the margins of these areas; the Himalayas and associated high mountain ranges, including the Hindu Kush along the Afghanistan/Pakistan border, allow cold-weather conditions to exist at high elevations as far south as the Tropic of Cancer (23.5° N latitude).

In fact, most cold-weather regions are not always cold. Temperate zones that are closest to the equator generally have 3–6 months of genuinely cold weather. Farther from the equator, the subpolar zones have 6–9 months of cold. Only when one reaches the true polar zones, beyond the Arctic Circle in the Northern Hemisphere and on the mass of the Antarctic continent, does one experience cold-weather conditions year-round.

History

Historically, most military operations in cold weather have occurred in the temperate zones where nations and populations are many; however, there have been exceptions. For example, the Finnish-Soviet War of 1939–1940, the Aleutian campaign in the Pacific Theater of World War II, the Soviet Petsamo-Kirkenes operation in 1944, the Falklands War of 1982, and the Chilean-Argentine dispute

(short of war) concerning Patagonia in the late 1970s all occurred in subpolar and polar climatological zones.

Whenever opposing armed forces meet in cold-weather regions, both sides face a third force that is beyond human control: the cold. In short, cold kills. In 218 BCE, Hannibal lost 50% of his invading forces to the cold during his Italian campaign. The sorrows of the French army during its Russian campaign of 1812 are well known. Likewise, both the Soviet and German armed forces suffered casualties to the cold that equaled or exceeded those from combat on the Eastern Front in World War II.

The United States was not immune to these effects either. During the American Revolutionary War, in both 1777 and 1778, the Continental Army suffered grievously from prolonged exposure to the cold. In World War II, American casualties due to cold weather in the European theater of operations exceeded 10% of total casualties. In the Pacific Theater, the invasion of Attu Island in the Aleutians proved the second most costly operation of the war (in terms of troops involved); most of the casualties were due to cold weather.

Even in the modern era, cold weather continued to make its effects known to armed forces. In the Korean War, more than 90% of the 26th Field Army (People's Republic of China) suffered cold-weather injuries and death. Likewise, during the epic fighting withdrawal of the American X Corps (X Corps was a corps of the U.S. Army in World War II and the Korean War. It was activated in May 1942) from central North Korea to the ports of Hungnam and Wonsan, more Allied casualties occurred from the weather than from combat. The same pattern of cold-to-combat casualties has taken place during the various Pakistani-Indian and Chinese-Indian conflicts in the 1960s, 1970s, and 1980s. Though official statistics are unrevealing, Soviet reports and memoirs of its Afghan War reflect the continuing significance of cold weather on their road-bound major operations. Finally, one of the major reasons attributed to the defeat of a numerically far superior Argentine army to the British forces in the Falklands War was the lack of cold weather gear for the Argentine troops on the main lines of defense.

In the 21st century, cold weather continues to influence military operations. During Operation Joint Endeavor and related operations in the former

Napoleon Bonaparte at the head of the French army in the retreat from Moscow, 1812.

Yugoslavia, the tempo of North Atlantic Treaty Organization military action was reduced by half because of challenges posed by weather conditions. In the continuing (as of 2011) Operation Enduring Freedom and related operations in Afghanistan, the North Atlantic Treaty Organization and opposing Taliban forces define their tempo of military activity according to the seasons. In 2002, during Operation Anaconda, high altitudes coupled with cold-weather conditions significantly hindered elite Allied forces from decisively defeating al Qaeda and Taliban forces in the Shah-i-Kot Valley.

Operational Effects

A common method for assessing the effects of cold-weather military forces' performance is to use the operational functions that define every military operation as a guide. There are six doctrinal (U.S.) functions: (1) command and control, (2) fires,

(3) movement and maneuver (mobility), (4) intelligence, (5) force protection, and (6) logistics.

The command and control function is explicitly dependent on two tasks: (1) leadership and (2) communications. In cold-weather operations, the normally stressful military leadership challenge is multiplied many times over because of the insidious effects cold has on a military force composed of human beings. For those who have not personally experienced extended exposure to cold weather without normal shelter, it is difficult to understand the paralyzing effects cold has on the human body. Cold attacks individuals physiologically and psychologically. Physiologically, the effects of cold manifest themselves mainly through frostbite, hypothermia, and immersion (trench) foot. Any one of these manifestations can result in injury requiring immediate medical attention and evacuation from the battlespace; any one or a combination thereof can and has caused death. Of these three, hypothermia is the

most insidious because it can affect humans even in seemingly moderate temperatures (e.g., 40°–60° F). Also, hypothermia is not immediately obvious to either the affected individuals or their companions; sometimes, the delay in recognizing the symptoms causes significant disruptions in military activity, especially if an affected individual is in a leadership position. Equally injurious to effective military activity are the psychological manifestations of cold weather. The most common symptom is the withdrawal of the individual from companions, followed by delusions and hallucinations leading to extremely aberrant behavior that can and has caused injury and death both to the individual and fellow soldiers.

The extreme challenge of leadership to achieve effective command and control under these conditions is to insist on a strong discipline of sound private and communal hygienic practices and to enforce a strong sense of teamwork and positive unit cohesion. Leaders must accomplish this while dealing with the normal set of operational problems and their own physiological and psychological effects from the cold. From experience, one learns that leaders and leadership necessary to conduct effective military conditions in cold weather are a primary requirement for success. The only successful method of achieving this level of leadership is through individual and unit training—not periodic but continuous training for up to 2–3 months before commitment to live operations. Short of actually living in cold-weather conditions as a matter of course (e.g., living in the subpolar or polar regions), training is the only way to achieve effective military forces for operations.

Communications is the second major task of the command and control function. Modern militaries rely on high-technology communications systems that generally have not been proven in extreme cold-weather conditions. This makes armed forces committed to such operations highly vulnerable to the physical eccentricities of cold-weather environments. Today's communications technologies are highly dependent on satellite access. In temperate and subpolar zones, these technologies generally work under all weather conditions. The exceptions to this observation are those technologies that use ultrahigh frequency and higher radio-frequency bands; such communications systems are vulnerable to at least temporary disruption due to rain, sleet, hail, and snow. As a rule of thumb, in high-latitude military operations, the effectiveness of

digital communications noticeably declines with each increasing degree of latitude; this heuristic can begin to be applied as low as 45° latitude. The key variable in all cold-weather communications is the condition of the earth's mid-to-upper atmosphere, particularly the ionosphere. Atmospheric conditions are dependent on the sun's electromagnetic activity and the response of the earth's magnetic fields to such activity. If solar activity is intense, the earth's atmosphere becomes polarized, resulting in the disruption of electronic signals that military radios use. Sometimes the effects on communications can be catastrophic; during periods of prolonged solar activity, it may be impossible to communicate with adjacent and proximate forces for days and even weeks. Polarization of the earth's atmosphere in high-latitude cold-weather regions can also pose a significant risk of damaging or destroying communications equipment, especially integrated circuits, through induced currents generated backward from atmospheric propagation media (e.g., electromagnetic storms generating pulses similar to those generated by nuclear explosions in the atmosphere).

Command and control organizations must take these effects into account before committing decisively to operations. Operations in cold-weather climates generally tend to favor decentralized and smaller (cohesive) unit operations because of the leadership and communications challenges associated with the climate.

Operational fire is the second operational function, which is also affected by cold weather. In this case, the challenge typically relates to hardware. Extreme cold literally changes the caliber of weapons systems; cold temperatures shrink metal. With the close tolerances characteristic of modern weapons systems (e.g., rifles, artillery), the shrinkage can cause weapon malfunctions. Damp cold weather limits the effectiveness of precision-guided munitions to a degree not experienced in other climates. During Operation Allied Force, the poor wintry weather that characterized the operating environment of Kosovo in Spring 1999 limited the North Atlantic Treaty Organization's air sorties to 1/10 of their total capability. Cold weather in all temperature zones tends to reduce the effectiveness of all systems requiring electricity; sometimes this is due to reduced battery life (in extreme cold-temperature conditions), and sometimes this is due to shorting of equipment because of moisture intrusion.

The terrain in cold-weather regions can affect weapons systems capabilities. In the subpolar and some polar zones, the ground is tundra; this means there is a spongy layer of flora, wet during the warm season, that overlays a layer of earth that is permanently frozen—permafrost. Tundra in warm seasons can absorb some destructive effects of munitions; this effect was observed of naval gunfire support during the American invasion of Attu in the Aleutians during World War II. The gunfire came from 14- and 16-inch shells from battleships; the targets were Japanese strong points. Even with direct hits on fortifications using tundra as protection, the shells had highly reduced effects. Under the sea, the effects of polar ice can reduce or foul sensors for submarines. In the air, subpolar and polar zones that encompass maritime environments often include aerial conditions experienced nowhere else on earth; violent wind conditions arise that kick up snow and fog into low altitudes and cause whiteouts that make ground targets invisible to see and very difficult to sense by aircraft, or make it impossible to take off from fields or platforms in those zones.

These observations lead to another rule of thumb for cold-weather operations: The more weapons systems are exposed to cold-weather conditions, the more likely their effectiveness is going to be reduced. Commanders would do well to plan for reduced weapons effectiveness instead of being surprised during operations.

Movement and maneuver (mobility) in cold-weather conditions is very difficult. Seas freeze, making surface movement impossible except for specialized ice-breaking craft. Ground movement is hazardous due to cold rain/snow accumulation, drifts, and whiteouts due to blowing snow. Only in the air the movement of aircraft is not significantly affected by the cold; however, once on the ground, aircraft are subject to the same limitations as other ground movement capabilities. Based on the experience of World War II, the Korean War, and numerous exercises, commanders must realize that routine movements will take at least twice as long in cold weather as in temperate weather. However, this does not mean that maneuver is impossible or undesirable. The Soviet and German forces in World War II and the Chinese forces during the Korean War found that maneuver in cold-weather conditions provided them with tactical and operational advantages against enemy forces and negated certain enemy capabilities (almost always involving technology).

Intelligence in cold-weather operations generally faces the same challenges as operations elsewhere, except in the high latitudes of the subpolar and polar regions. In those exceptions, intelligence on enemy forces and operating environments actually becomes relatively easier because of the thermal emissions from living systems (humans) and from their operating equipment, which stands out in great contrast to the background. Electronic (especially thermal) sensors are very useful in these climates. Human intelligence is very difficult to obtain in all cold-weather climate zones. There is a natural instinct for people to avoid prolonged exposure to the elements of cold weather; patrolling, while absolutely necessary, thus tends to be limited to short-range force protection actions. Long-range patrols in the subpolar and polar regions are extremely difficult for two reasons: First, the conditions are hostile to human survival and, second, logistical support for any but the smallest patrols becomes prohibitive.

Force protection in cold-weather regions often is a matter of ensuring individual and unit survival from the elements, in addition to the enemy. Protection begins with individual requirements. The primary and absolute requirement is for individuals to remain as dry as possible; wetness in clothing or on skin significantly reduces human heat retention, leading to any and all of the big three threats to human health in cold weather: frostbite, hypothermia, and immersion foot. Individuals must be adequately equipped for extended periods of exposure to cold weather prior to being committed to operations. Allied operations in the first year (1943–1944) of the Italian campaign of World War II came to a virtual halt in large part due to poor equipping of soldiers with winter gear. All modern armed forces of nations that conduct operations in cold-weather regions have doctrines and equipment requirements for individual protection from the cold.

Unit force protection is far more difficult to achieve in cold-weather operations than individual protection. For naval and air forces, the challenge is not much different from normal conditions, with the notable exception of individual protection of sailors exposed to cold-weather conditions. Force protection in this case means the construction of fighting positions that can also protect individuals from the effects of the cold as well as from enemy fires. Such protection includes positions that include overhead cover and places for various forms of heating. Tents

may work in rear areas but are useless, even dangerous in combat areas. If engineering materials are inaccessible, the fighting units must carve out of wet or frozen ground some form of protection.

The sixth operational function, logistics, includes personnel resources. It is perhaps the most important function in cold-weather operations. Personnel get used up far quicker in cold-weather operations than in other types of military activity. With good doctrine and training, individuals and units rotate from combat to rear areas at least twice as quickly as in other weather regimes. This rotational difference was the major reason why a highly outnumbered and outgunned Finnish force could withstand and, at least initially, defeat the Soviet armies determined to conquer them in the 1939–1940 war. The Finns had warming huts to which frontline soldiers rotated every two hours; the Soviets had none, and many of their soldiers froze to death in their forward positions.

Another logistical factor affecting personnel and units in cold-weather operations is the need to maintain a high caloric and hydration intake. In cold weather, individual soldiers performing tasks require more than 5,000 calories and a gallon of water a day to be effective. This requirement alone places significant demands on the supply chain. If the requirement cannot be maintained, human fighting efficiency can be expected to decline 50% per day or more depending on what percentage of the daily food/liquid intake can be supplied.

The logistics challenge extends beyond personnel issues in cold-weather operations. All materials for armed forces are affected by cold weather. Under conditions of extreme cold, rubber loses its flexibility, many plastics lose their resilience, glass becomes highly impact sensitive (to simply touching), certain metals become brittle and some shrink, and lubricants thicken or freeze. In the subpolar and polar cold, engines of all types can freeze within minutes if left nonoperational. Supplies that provide heat to personnel and equipment become paramount for delivery to forward units. For the logistics function, this means that normal stocking of parts and major components is insufficient to meet demand in these operations. Because of the mobility issues discussed earlier, transportation of necessary supplies takes longer. As military operations move away from temperate zones, the accessibility of roads, railheads, airports, and seaports decreases, thus complicating the

placement of necessary logistics footprints. All failed historical operations and campaigns in cold weather have one point in common: All had failed logistics. One extraordinary illustration should suffice to demonstrate the criticality of logistics to cold-weather operations: In the siege of Stalingrad, 1942–1943, Marshall Hermann Goering, the German air force commander, insisted to the German General Staff and Fuehrer Adolf Hitler that the air force could provide adequate airlifted supplies to the besieged force. In fact, the Luftwaffe could only airlift one quarter of the supplies necessary for the German army in Stalingrad. By the time the siege ended in the German surrender, German soldiers were eating rats.

Observations

Military operations in cold weather are extremely difficult. They require the maximum effort from individuals and equipment. There are very few specialized military systems for dealing with cold weather: for example, icebreakers for naval operations, skis for people and for aircraft, and snowshoes and snowmobiles for ground operations. Technology is limited in its ability to multiply the combat effectiveness of military forces under cold-weather conditions. There is no technological “magic bullet” that can overcome cold-weather environments. The introduction of unmanned aircraft, for gathering intelligence and for strikes, has proven a great contribution to operational success, not, in least, as a replacement for soldiers’ suffering through difficult and dangerous terrain and weather conditions. However, the same bugaboos that limit human performance also limit unmanned aerial vehicle performance; cold-weather effects blind or fool sensors. In high latitudes, during periods of high solar activity, control of unmanned aerial vehicles becomes problematic as the ground control stations suffer from communication interference or blackout. During Operation Anaconda in 2002, Allied forces had the benefit of the best intelligence-gathering systems available; yet the intelligence underestimated the number of enemy by over half and failed to detect the enemy’s true positions.

Success in cold-weather operations, as historical experience relates, depends on unit and individual training coupled with exceptional leadership, especially at the small unit level. This is a tried-and-true recipe for success in this weather. Now that the

Arctic has taken on strategic importance because of improved access to resources and increased transportation access due to global warming, this basic fact concerning cold-weather operational success becomes critical for military leaders to acknowledge and to prepare for. Yet there are no specialized American units for cold-weather operations, and American training mostly focuses on only the very basics for individual survival in the cold, not continued operations in the cold. In fact, American cold-weather operations' doctrine is for the most part more than 40 years old; cold-weather unit training (i.e., exercises) is limited to an annual affair with Norwegians, and biennial naval exercises. One can contrast this approach with that of the Russians (as well as Canadians and Norwegians—all of whom have interests in the Arctic), who have designated special cold-weather units, developed modern doctrine to conduct operations in the cold, and regularly train to operate in the cold. The Russian approach aims to strategically succeed in the cold-weather realm of the Arctic.

OPERATIONS, JUNGLE

Jungle terrain covers almost 10% of the earth's surface, including large areas of Central and South America, Asia, Oceania, and Africa. This kind of environment has traditionally been considered a mysterious and hostile environment for human life. Some groups have learned to live and fight in this terrain, including the Ticuna and Yanomani tribes. A classical field manual titled *Jungle Warfare*, published in 1942, points out that the jungle fighter has two enemies: man and nature, with the last being particularly important due to the prevalence of wild animals, insects, and diseases including malaria, yellow fever, and dysentery in these areas. At the same time, jungle characteristics such as sudden climate changes, heavy rains, dense vegetation, uncountable rivers and puddles, and rough terrain make these areas suitable for a particular form of military operation in which patience, discretion, and willpower are the best weapons against an enemy.

For these reasons, soldiers who will serve in this type of environment should learn to use nature as an ally, taking advantage of natural cover and camouflage in order to survive under extreme conditions. Historically, military experts have collected information from local settlers and prior military experiences to help train military forces operating in jungle environments. In this way, European colonists between the 15th and 19th centuries learned to carry out incursions and deep-penetration operations in this type of terrain in South America, Southeast Asia, and middle Africa. During the 20th century, the number of jungle operations increased due to the development of modern warfare, where virtually all areas of the globe fell within military forces' reach. At the turn of 21st century, jungle operations have become less common and are limited to particular countries in tropical areas in which guerrilla groups are fighting against governments. This entry

discusses the characteristics, weapons, and equipment of jungle warfare and explores jungle units and operations around the world.

Characteristics of Jungle Warfare

Any kind of military operation has its own characteristics, and jungle warfare is not an exception. According to the book *Military Geography for Professionals and the Public*, written by John Collins, an expert in war operations and environment, there are 10 elements to consider in jungle scenarios: (1) the predominant role of small military units, including special forces teams or medium units such as platoons; (2) the fact that movement is often slow and laborious due to dense vegetation and the prevalence of rivers and small lakes; (3) foot soldiers are the main corps for this environment more than mechanized infantry; (4) airstrips are small and, in some cases, are very difficult to prepare without previous arrangements; (5) visibility is reduced not only at night but also under sunlight; (6) land navigation through jungle requires advanced techniques; (7) heavy weapons and air support are inhibited; (8) control, communications, and logistics are very difficult, and in some cases, soldiers must be fully self-contained; (9) special forces and defenders have a natural advantage with the cover provided by the environment, very useful for ambushes; and (10) technology and the numbers of troops are less important than adaptability. More than inside any other environment, life and war in the jungle necessitate the use of a sixth sense and learning to identify the enemy's traces, sudden changes in the environment, and even animal reactions to survive and fight successfully.

Basic Skills

Jungle operations demand special physical and psychological training due to the high probability of confronting enemy face to face through hand-to-hand combat, close firing, and bloody situations. For these reasons, very good physical condition and mental awareness are key elements to win battles. In contemporary warfare, technological equipment is an important complement to soldiers' duties; however, the jungle renders a number of military technologies less effective, thus corporeal and manual skills are very important for success.

Regarding physical training, it is necessary that jungle infantrymen train for long periods to cultivate

specific skills, including physical acclimatizing and marksmanship in warm and dense areas, hiking and swimming with all military equipment, nocturnal combat exercises, and first aid and preventive sanitary instructions to maintain good health—for instance, the simple but necessary activity of changing socks regularly to avoid immersion foot syndrome and treating drinking water with chloride. These types of skills are vital to maintaining soldiers' morale.

Mental training is also crucial. An environment surrounded by trees and weeds affects soldiers' perceptions about safety; for this reason, it is very important that morale be maintained. Likewise, soldiers should counteract feelings of solitude, particularly in times of inactivity by means of games, variation in the diet, e-mail, painting nature, and so on.

These elements are complementary, and to obtain the best advantages for jungle combat, professionalism should be inculcated during training, in nonfield operational activities, and in other periods of time.

Tactics

Jungle operations are very different from conventional military operations. Jungle actions usually do not involve great battles between formal troops; on the contrary, jungle encounters are reduced to ambushes, brief engagements, and raids. For these reasons, jungle troops should be able to embrace specific tactics effectively on the battlefield. Due to the extensive foliage that reduces visibility, soldiers must have expertise with camouflage, covered movement, and surprise. At the same time, they must take advantage of intelligence techniques (e.g., surveillance, gathering information, collecting information from local settlers) to observe enemy movements and to attack first. These activities include important reconnaissance operations by means of long and short patrols in squad-sized units to collect information about enemy troops. On the other hand, classic jungle deployment takes the form of multiple columns under platoon organization, using Global Positioning System devices and soldiers' sufficient training to guide the unit.

Types of Operations

Jungle operations can be divided into offensive and defensive types. Due to the jungles' unique conditions, each has its own characteristics. Offensive operations should include an appropriate utilization of organic and supportive weapons such as artillery and aerial support. The most common types of

offensive operations are movements across the jungle to contact enemy forces with heavy and rapid fire; another common operation takes the form of a surprise attack, using carefully collected intelligence information. In this kind of offensive, operation soldiers should remain alert for booby traps, snipers, and hidden positions. Infiltration is another basic offensive operation used in jungle terrain, and it is very useful to reduce enemy forces, but its effectiveness depends on discretion and patience to reach targets. Finally, jungle operations may include attacking fortified forces using dense jungle to cover their positions from aerial reconnaissance and other methods of observation. In this type of operation, supporting fire and strong fire against enemy positions are vital.

With regard to defensive operations, the ability to use foliage and cover to protect the troops and movements and to concentrate light weapons in particular places and times to maximize effectiveness are crucial. Additionally, coordinating support from aircraft and helicopters is vitally important. Other considerations include using night vision technologies and warning devices and regularly implementing patrols and ambushes to prevent enemy infiltrations or actions against friendly troops. Therefore, defensive scenarios should be previously organized by commanders to inform troops about measures to respond to enemy attacks or counterattack.

Weapons and Equipment

Jungle infantrymen primarily rely on common light infantry equipment. This characteristic is the norm for jungle units because soldiers must carry all their equipment with them. The main arms used among troops are common and sniper rifles, light machine guns, hand grenades, multigrenade launchers, 60-mm mortars, and occasionally—and under transportation availability—81- and 120-mm mortars. However, technology has improved in recent decades to include Global Positioning System units, portable communications and satellite gadgets, night and thermal vision devices, antimosquito aids, low spectrum lights, and so on. Camouflage has evolved, mainly since the Vietnam War, to help troops conceal themselves and their positions. During the Vietnam era, soldiers wore olive drab uniforms, but in recent years, many troops have begun to use tiger stripes and woodland patterns to improve camouflage. Lately, disruptive patterns have been included in the jungle clothing such as digital camouflages

and *flecktarn* models to improve performance. In recent years, helmets and body armor have also been eschewed, with the exception of the Colombian conflict.

Perhaps the most crucial equipment supporting jungle operations has been the helicopter. Utilized extensively in Indochina operations in the 1960s and 1970s to evacuate troops, support with heavy fire, and transport soldiers quickly in a difficult terrain, helicopters have proved their worth and have become a central player in jungle operations in recent years around the world, including Central American conflicts, the Just Cause Operation in Panama, and the Colombian conflict.

Jungle Units Around the World

Several countries with large jungle zones have organized parts of their armies into jungle corps, training these units in tactics to survive long periods of time in these zones and confront conventional troops throughout

asymmetrical actions. Brazil is the leading army in the world with this type of military unit—including battalions and brigades—dedicated exclusively to jungle operations to protect Amazon regions. Likewise, due to long-lasting guerrilla warfare in jungles areas, the Colombian army has prepared Brigadas and Batallones de Selva. In Asia, the famous Malayan Royal Army Regiment and Indonesian Special Forces' Koppasus engage in these types of operations as well. Other armies have trained regular forces to act in jungle zones; the U.S. Army has the famous “Green Berets,” the United Kingdom has specialized groups inside the Special Air Services, and the French Foreign Legion has the 3rd Foreign Infantry Regiment deployed in Guyana. All of these are considered elite units within these armies.

From Vietnam to Current Counterinsurgency Operations

The involvement of U.S. forces in Vietnam from 1961 until 1973 placed American troops in a jungle

A UH-60 Black Hawk helicopter of Company A, 1st Battalion, 228th Aviation Regiment, passes over a ridge during a flight in support of Operation Just Cause.

environment for the first time since World War II, when GIs fought against Japanese troops in the Pacific theater of war. In effect, Vietnam was a laboratory for jungle operations, as combat took place in a country covered by dense foliage and subject to heavy monsoons. U.S. soldiers had to adapt to jungle scenario rapidly, and this period highlighted problems in U.S. training and operations. Nonetheless, U.S. GIs proved their ability to fight in this terrain in spite of their urban origin. Innumerable operations to search for Vietcong and North Vietnamese army units were carried out in the jungles of Vietnam, including some incursions into Cambodian territory with Special Forces patrols. After the Vietnam War, Central American civil wars in Honduras, Nicaragua, El Salvador, and Guatemala forced the centerpiece of jungle fighting. In these countries, insurgency groups acted against governmental troops in a dense jungle. In recent years, jungle operations have been common in the Colombian conflict where local military forces with U.S. support have been fighting against the Revolutionary Armed Forces of Colombia (Fuerzas Armadas Revolucionarias de Colombia, or FARC) in the Amazonian jungle. In this conflict, guerrilla and counter guerrilla activities have become normal operations within the larger sphere of jungle operations, where infantry jungle skills and aerial support have been fundamental to fighting in this terrain.

Jungle Operations in Contemporary Perspective

It appears that jungle zones will continue to be a critical arena for military operations in the future. Jungles offer an ideal place to hide the activities of illegal groups such as terrorists, organized criminals, drug traffickers, and guerrillas, who use dense vegetation and rivers to carry out criminal activities out of sight of authorities and local settlers. The security of the jungle also offers these groups the opportunity to plan and organize attacks against both governments and private citizens. For this reason, an active jungle training program is still a priority in many militaries, including the U.S. Marines' Jungle Warfare Training Center (Okinawa-Japan), the Colombian army's Escuela de Selva, and the Brazilian Centro de Instrução de Guerra na Selva.

New technologies will continue to play a central role in jungle operations in the future, as intelligence and communications supported by satellite and other electronic devices are crucial in maintaining real-time operational, strategic, and tactical advantage for troops on the ground. At present, the Brazilian

Sistema the Vigilância de la Amazonia (Amazon Surveillance System), which combines satellite and aerial surveillance to prevent and to act against conventional threats in the Amazon Jungle, stands as a model for other nations. Likewise, aerial equipment will continue to be vital for supporting troops and carrying out surveillance and attack operations. Unmanned aerial vehicles appear to be gaining traction with worldwide militaries, but conventional military aircraft—especially helicopters—will continue to play a major role as well. Recently, these new technologies have proven very useful in capturing or attacking so-called high-value targets like the leaders of guerrilla and criminal organizations. Therefore, a combination of aerial capabilities supported by specialized jungle troops represents the best operational model for contemporary jungle operations.

OPERATIONS, MOUNTAIN

Mountain warfare and mountain operations in the modern American context refers to the act of, and the specific demands involved with, engaging in combat

operations in winter, hilly, or mountainous terrain. Mountain operations have traditionally been undertaken by specialized regular military units, avoided all together by belligerents due to the adverse and demanding conditions, or utilized by guerrilla, partisan, and nongovernmental combatants as a means to gain an advantage over traditional military opponents. Combat operations in mountainous terrain are especially dangerous since combatant forces need to concern themselves with not only surviving enemy engagement but also the harsh and often lethal conditions typical in high and precarious terrain. This entry discusses the history, equipment, weapons, and tactics of mountain operations.

Early Mountain Operations

Such operations in the 19th and early 20th centuries were often a necessity since belligerent states were frequently separated by mountainous terrain, and thus, operations across these natural barriers were required. The term *mountain operations* became common in military circles during the Late Middle Ages when it became common for warring monarchies to find it difficult or impossible to cross the Swiss Alps—though Swiss forces had the specialized training and familiarity with the terrain. During these periods, such operations typically consisted of smaller, more agile units of the defending army ambushing or cutting off the larger more cumbersome formations of attacking armies by isolating their various parts with the aid of the natural choke-points that such terrain provides. More recently, some specialized units and equipment were developed for mountain operations. Some examples include the Austrian and French mountain troops from the Napoleonic Wars and later specialized artillery for mountain warfare.

Mountain artillery pieces, known as mountain guns or pack guns, were short-barreled infantry support artillery rarely larger than 75 millimeters in diameter. These pieces were developed by states and arms manufacturers since traditional, heavy, long-barreled artillery pieces could not be manipulated or maneuvered in mountainous terrain. These pieces were often easily disassembled for transport via man or pack animal (thus the name pack gun). The first standardized and mass-produced pack guns were developed by two Greek army officers, Majors Lykoudis and Danglis, in 1893. Surprisingly, their designs were not originally popular and were not

utilized until the French army firm Schneider took interest in them in 1904. This was quickly followed by a competing variant made by the German firm Krupp the same year. Since then, mountain guns have been standard members of national arsenals for states that foresaw a need for combat operations in mountainous terrain.

It is generally regarded as essential for units fighting in mountain environments to be light, mobile, and armed with equipment that, while contributing maximum firepower, does not limit or hinder travel over heavy terrain. Since many mountain regions are often covered in snow, many mountain warfare units also train their troops in the use of skis and snowshoes for infantry travel or snow-based tracked vehicles for higher mobility. Finally, due to extreme and often shifting weather conditions, it is considered an absolute necessity that mountain troops be experts at survival and equipped with adequate shelter from prevailing conditions like snow and high winds.

Mountain Operations 1914–1989

Prior to World War I, mountain warfare was a somewhat infrequent practice due to the additional costs in materiel, troops, and capital required to wage successful mountain campaigns. When war broke out across Europe in 1914, however, many of the boundaries of belligerent powers were defined by mountain ranges, and thus, mountain operations became standard practice of both the Entente and Central Powers. Furthermore, nearly all of the warring states (less the United States) had specialized mountain warfare divisions or units on their rosters that had yet to be tried in combat. A majority of World War I mountain operations were conducted between Italy and Austria as well as Russia and the Ottoman Empire since the respective borders were fairly rugged. This was especially true in the south between Austria and Italy where, over the course of the war, the Austro-Hungarian military proved quite adept at defending against Italian forces as the latter attempted, in vain, to move across the Julian and Carnic Alps into the central plains of Austria-Hungary. The only other major mountain campaign of the war occurred in the Caucasus, when in late 1914, the Ottoman forces attempted to attack Russia via the Caucasus Mountains. Due to poor training, a lack of supply, and superior Russian position, Russian forces inflicted appalling casualties on the Ottomans.

In World War II, despite the predominance of mobile armored warfare across Europe, mountain operations dominated the German assault into Norway and played major roles during the Allied assaults against Sicily and the Italian mainland. It was during this time that the first American units specializing in mountain warfare prepared for combat in Europe and Asia. Among these was the reorganized 10th Light Infantry Division, renamed the 10th Mountain Division in 1944. This unit made its name in the mountains of central Italy against fierce German and Italian resistance in the Apennine Mountains. Specially equipped with draft animals, winter clothing, and climbing gear for combat that often took place at 3,000 and 4,000 feet above sea level, the 10th Mountain Division served with distinction until it was withdrawn from Europe in July 1945.

Following World War II, mountain warfare remained the responsibility of specialized units and divisions in national armies, though many such units were deactivated following the end of the war. For the United States, mountain operations would need to be relearned for Cold War conflicts, especially in Korea and Vietnam, where mountainous and rugged terrain would again require the U.S. military to adapt to conditions that required infantry oriented toward reduced size and weight for reasons of both strategic and tactical mobility.

Outside of the United States, other 20th-century conflicts dominated by mountain operations included the Falklands War, the Kashmir Conflict between India and Pakistan, and best known, the Soviet war in Afghanistan. In 1979, Soviet armies entered the Democratic Republic of Afghanistan to prop up the floundering communist regime in place there. Soviet forces entered the country via two ground routes and one air corridor. Within days of the beginning of Soviet operations, Russian troops controlled every major city, military base, and strategic center in the mountainous and wilderness-ridden country. These troops were almost entirely composed of armored divisions or motor-rifle divisions with only a handful of mountain-rifle (mountain light infantry) battalions in the first waves. Despite the efforts of the Soviet occupiers to subdue and pacify the country, nationalist and religious extremists took to the hills of Afghanistan's mountainous interior to wage a guerrilla war of attrition against the Soviet military. Much like in the Vietnam conflict, despite the fact that the regular occupying

forces exercised direct control over every population and military center, a coordinated and well-armed guerrilla force upset logistics and communications by attacking supply convoys, isolated outposts, and units (post-March 1980). When the Soviet's counter-attacked or organized large-scale offensives into the Afghan interior, the treacherous and inhospitable terrain that is quintessential to mountain operations awaited them. On dozens of occasions, entire Soviet divisions supported by rotary and fixed-wing aircraft pushed into the rugged interior to either find well-positioned and concealed rebel fighters holding advantage in the hills and mountains, or only the remains of an elusive enemy that had snuck away under the generous cover of mountain passes and deep valleys.

When Soviet forces did encounter resistance, it was typically from well dug in and defended Afghan rebel units that took full advantage of the mountains to limit Soviet mobility and air power. The Soviet military, armed and equipped with the arms and vehicles to fight a war on the plains of Europe, struggled to adapt to the mountain conditions of Afghanistan. Some of these limitations were most evident in Soviet armor and artillery. The T-62, the main battle tank for the Soviet occupation, was regarded as a fair opponent for Western designs; however, in Afghanistan, with a main cannon that could only be elevated to +16°, operators found it almost impossible to engage rebel units that often attacked Soviet units from high above in the cliffs and crags of mountain passes. For artillery, the Soviets were equipped with heavy and devastating long-range artillery pieces that were often towed into position to be fired. These weapons, far too large and cumbersome to be considered pack guns, were of limited use in the high peaks and narrow passes that represent the predominant features in mountain warfare and the Afghan interior, especially in the north and west of the country.

After more than 9 years of constant fighting and with the Soviet Union and its occupation forces still unable to exercise any major degree of control over the Afghan interior, after suffering more than 9,000 killed in action and 53,000 wounded in action casualties, the Soviet Union officially withdrew the last of its forces from Afghanistan on February 15, 1989. Over the course of the conflict, while the Red Army did attempt to adapt to local conditions on numerous levels, the traditional nature of the training and

equipment provided to the Soviet soldier doomed him to being unable to tame the vast and mountainous interior of Afghanistan.

Modern Equipment and Tactics

Learning from the lessons of the Korean and Vietnam Wars as well as from the Soviet misadventure into Afghanistan, in 1985 the U.S. Army reactivated the 10th Mountain Division as the nation's specialist unit for mountain warfare. The unit served in Operations Desert Shield, Desert Storm, Restore Hope (Somalia), Uphold Democracy (Haiti), Joint Guardian (Bosnia and Herzegovina), and, most recently, in the Global War on Terrorism in Afghanistan and Iraq. Unlike most other U.S. Army divisions, the 10th Mountain is not typically deployed with large complements of armored vehicles or tanks. As a light infantry division adapted for mountain operations, the specialized load out of the division is composed of combat infantry who are not only experts in land navigation, marksmanship, survival, and mountaineering but also equipped with specialized lighter gear and equipment for a higher degree of mobility and tactical agility. For its primary infantry weapon, the 10th Mountain Division and most of its international counterparts tend to favor shortened carbines, such as the Colt M4, as opposed to the longer and heavier assault rifles used by regular units, such as the M16A2. Additionally, for deployments in regions like Afghanistan, modern mountain divisions rely almost entirely on rotary aircraft for their transportation and close support needs.

As the Soviet Union learned in the 1980s, Afghan rebels and terrorist units that operated in the countries' interior often ambushed heavily armored convoys along Afghanistan's road networks, thus reducing road travel to little more than a way to invite attack. Today, when mountain warfare operations are undertaken by the United States or its North Atlantic Treaty Organization allies, the primary mode of troopers moving in and out of the rugged Afghan interior is by air. For the U.S. Army, the workhorses of this detail are the UH-60 Black Hawk and the CH-47 Chinook transport helicopters. Able to deploy troops from a small landing site or simply from a low hover above a mountainside, these aircraft permit the rapid deployment and exfiltration of mountain warfare soldiers in a way never

seen before. Additionally, like their forefathers in the mountain operations units of the early 20th century, the U.S. Army outfits its mountain specialists with lighter, more mobile fixed artillery that is capable of both direct and indirect fire missions. These weapons systems include the M198 155-mm howitzer, the M224 60-mm mortar, and the M252 81-mm mortar. All are capable of being disassembled to various degrees and can be used in conditions short of sheer peaks that mountain specialists experience.

Contemporary Mountain Operations

Mountain operations have evolved over the past century from an aspect of war often avoided by militaries to an arena that has had entire units, weapons systems, and campaign plans developed for it. Equipped with the latest and lightest in firearms, artillery, and transportation, the modern mountain warrior is equipped and trained like never before to engage and defeat the enemy regardless of the difficulty of the terrain or the prevailing inhospitable conditions.

OPERATIONS RESEARCH

Operations research is a discipline that utilizes analytical methods to help make better decisions. It applies techniques such as mathematical modeling to investigate intricate problems. Operations research utilizes a wide array of techniques, including queuing theory,

mathematical optimization, simulation, data envelopment analysis, expert systems, and decision analysis. The aim of operations research is to arrive at an optimal or near-optimal solution to extremely complex problems. While there are subtle distinctions, the terms *operational analysis*, *quantitative management*, *management science*, *operation analysis*, and *systems analysis* are frequently used as synonyms for operations research. In modern times, the use of computers and statistical analysis has caused operations research to frequently overlap with the related fields of computer science and information technologies. It began as a discipline to study military problems with the aim of providing military leaders with a scientific basis to help them make decisions and improve military operations. Now utilized not only by military leaders but also by civilian governments, medical organizations, charitable organizations, and businesses in the commercial and industrial fields, operations research can provide insight into problems of resource allocation, inventory control, and the planning of large-scaled construction projects. For example, airline corporations and airport management employ operations research to schedule flight takeoff schedules and crew timetables, while some cities use operations research to manage the flow of water from reservoirs. It gives people the ability to make informed decisions based on more complete data, consideration of available options, and researched predictions of outcomes and estimated risk, and allows for the use of the latest decision tools and techniques. This entry discusses the history and process of operations research and provides some examples of operations research projects.

Operations research is distinguished by systems engineering, as large-scale problems are examined using models when laboratory testing is impossible. The five principal segments for implementing operations research are (1) definition of the problem, (2) construction of a model, (3) solution to the model, (4) validation of the model, and (5) implementation of the solution. The quality of the results of operations research is only as good as the quality of the model being tested, and part of the process is to repeat the sequence of problem-model-solution-validation-implementation several times, varying the model to determine the best solution. Before the term *operations research* came into use, mathematical modeling was used to solve problems. What was unique to operations research is that it took into consideration important intangible factors that are

not usually quantifiable, such as the importance of the human element, when determining a response. Today, operations research is almost always characterized by extensive computer simulations. Operations research has become such an important tool in so many fields that it has journals dedicated to the topic, with the most important simply named, *Operations Research*.

Early History

Operations research as a modern field can first be traced to the Bawdsey Research Station in the United Kingdom under the station's superintendent, A. P. Rowe, in Britain in 1937. He conceived of operations research as a methodology to analyze and perfect Chain Home, the early warning radar system of the United Kingdom. Such research had historical predecessors, such as Charles Babbage's research into the cost of transporting and sorting British mail. In 1840, Babbage's studies led to England's universal "Penny Post." However, Rowe not only evaluated the radar equipment and related network, but he also considered and analyzed the operating personnel's behavior. Taking into account how stress levels and tiredness could affect the usage of the equipment, Rowe made Chain Home a much more effective system.

Throughout World War II, almost 1,000 American and British scientists engaged in operations research. Teams of scientists and the Royal Air Force worked together to enhance radar detection, leading to an improved system of early warning of enemy aircraft approaching the United Kingdom. Patrick Blackett (Lord Blackett), working for the Royal Aircraft Establishment, created a team of scientists nicknamed "the Circus." The Circus utilized operations research to decrease the number of antiaircraft artillery rounds necessary to bring down an enemy aircraft. Prior to operations research, it took an average of more than 20,000 artillery rounds to shoot down an airplane; by 1941 and the Battle of Britain, this number had been reduced to approximately 4,000 per plane. After his success with the Royal Aircraft Establishment, the British navy requested Blackett's help in 1941. He put together a team to work on navy projects that included not only several prominent operations researchers but also two future Nobel Peace Prize winners. The most important project Blackett's team worked on was how to reduce convoy losses.

As British losses rose from German submarine attacks on their ships, the British initiated a convoy system, including warships to help counteract these losses. The navy wanted Blackett to determine whether small, quicker convoys, or larger convoys with more warships for protection provided more safety to commercial ships. Utilizing operations research, Blackett determined that the deciding element in determining convoy losses was not the overall size of the convoy but the number of warships escorting the ships, suggesting that a few large convoys was the most defensible formation.

The methodology quickly spread to the U.S. military, which first used it to solve problems such as the placement of bomb-dropped naval mines whose purpose was to destroy Japanese shipping. Operations research increased twofold the successful bomb rate of American B-29 airplanes bombing Japan from the Marianas Islands. The American military employed operations research to solve a classical problem that involved patrol planes coming upon enemy submarines on the surface of the ocean. The submarine usually dives immediately on noticing the patrol plane. The patrol plane must then decide what the optimal detonation depth for a depth charge explosion aimed at destroying the submarine is. An analysis of past submarine movements and human reactions helped pilots know where to drop the bombs. Operations research determined that depth charges triggered at 25 feet rather than 100 feet would cause kill ratios to increase. The results of this study were concrete: Before the change from 100 feet to 25 feet, only 1% of submarines were sunk and 14% damaged. After the change, 7% of submarines were sunk and 11% damaged. Another study determined that glossy enamel paint—camouflaged night fighters were more effective than the traditional dull camouflage paint finish. Operations research was also utilized by the Americans and British to help improve the probability that bombers would hit industrial targets rather than soft ones, such as residential neighborhoods, which helped save numerous civilian lives. By the end of the war, the American military realized that operations research was giving them such an edge in the war, and they extended its use to studies on equipment procurement, training, logistics, and infrastructure.

Operations research proved itself useful as the United States entered the Cold War and the space race. During the late 1960s, operations research

garnered media attention as it figured into the discussion about antimissile defenses, the survivability of the Minuteman intercontinental ballistic missile, and the discussion about mutually assured destruction. As the general public worried about Soviet missiles destroying American missiles in their silos, they wanted mathematical reassurance of their safety. However, using operations research, government specialists models showed that defending against a Soviet Union attack would be difficult since a nuclear strike would aim not only against missile silos but also against communications and control centers, which are harder to secure. In short, digging deeper missile silos and burying them under more concrete would not be sufficient to maintain nuclear deterrence.

Despite operations research helping the military to make more informed decisions, some historical tension existed between operations research mathematicians and the military. Particularly in the 1960s, officers generally resented Department of Defense secretary Robert S. McNamara's civilian "whiz kids." The tension was understandable; not only were operations researchers civilians, they also used an entirely different methodology than military leaders. Military leaders would attack a problem by drawing advice from war-experienced experts and take that advice and meld it with current military doctrine. Operations researchers start with a model and apply a numerical measure of effectiveness. However, since the friction of the 1960s, the military has incorporated operations research into its work, both utilizing civilians and teaching the field in military schools, creating officers knowledgeable in its uses. While operations research as a rule has greatly aided the military in making difficult decisions, during the early years, concerns that it could oversimplify an essentially complex situation were valid. However, properly implemented, it became an important tool in military planning. Operations research's successes bridged the gap between military and civilian forces, and key military campaigns, such as Desert Storm during the Persian Gulf War, were preceded by extensive computer simulations that have become the cornerstone of operations research.

In the 21st Century

Heading into the 21st century, operations research remained an important part of military operations. During the wars in both Iraq and Afghanistan,

operations research evolved to be an important tool in detecting roadside bombs and terrorist activity. In Afghanistan, Task Force Odin, in an ongoing effort known as Constant Hawk, utilized pattern analysis to observe a locality and find useful patterns of behavior. Using special video camera equipment, either mounted on special perches or loaded on to aircraft running regular routes, they would note changes in the area. Any differences in an area, whether a new rock or simply birds not in the same area, would be investigated. This has led to the detection of thousands of roadside bombs and terrorist ambushes. In Iraq as well, a related math tool, predictive analysis, has been used to determine who the bombers are, where they are, and where they are most likely to next place bombs. This allows military operations research specialists to offer regular “weather reports” about expected roadside bomb activity. These reports are taken very seriously by the people who plan personnel and supply transportation. The results have been groundbreaking; operations research has helped largely eliminate roadside bomb attacks on supply convoys that travel preplanned, frequently utilized routes. The high accuracy of predictions produced using operations research has saved many lives.

ORAL HISTORY

The intersection of oral history and military history has resulted in major changes in the way military history is constructed, written, and received. Through the deliberate effort to record and preserve

an individual's experiences as he or she remembers them, the inclusion of oral history in the research and writing of military history has produced a much more rich and nuanced treatment of the past, and has opened doors to new areas of study in military history. Strengthening the traditional approach to military history—which focused mainly on primary documentary evidence, such as afteraction reports and unit records—the use of oral history reflects the humanistic turn in the history profession over the past several decades and helps provide a more full understanding of military matters. This entry describes approaches to conducting and preserving oral history interviews and discusses the impact of oral history on the study of military history.

Essentially, oral history is the practice of conducting and recording interviews with participants of particular events or developments. Usually, the interviews are transcribed, or at least abstracted, and housed in an archive so that they may be accessed by researchers. In most cases, the interviews are conducted by a trained oral historian or an expert in the relevant field who questions the interviewee, or narrator, about his or her experiences. Oral history interviews are usually conducted in a question-and-answer format, and interviewees are encouraged to be as honest and open about their memories of their experiences as possible. Approaches to and methods of oral history vary, but interviews tend to fall into two basic categories: (1) the issue-specific interview and (2) the full-life interview. Modern technology has aided in the spread of oral history and oral history projects around the world, as increasingly affordable methods of recording interviews are becoming more widely available.

Primary Source Data

As a methodology of historical study, oral history has become a widely accepted practice of gathering primary source data. Historians have looked to oral history interviews to supplement and strengthen their work with more traditional sources. Personal memories add to the historical record, providing individuals' perceptions of events through differing vantage points, and add an element of humanity that helps readers identify with the people and the times. They can also help provide a more complete understanding of events by touching on subjects that often do not find their way into the official record. Also,

the inclusion of oral memories in historical writing provides a personal quality and can add a distinct flavor that is often missing from historical writing. Indeed, if history is the sum total of human experience over time, the inclusion of the voices of those who participated in historical events is not simply interesting but is necessary in any effort to write a full history.

As with all historical sources, oral history interviews should not be seen as the absolute authority on any particular subject, or even of the narrator's place in that subject. Human memory, by its very nature, is subjective and can thus be problematic for those seeking "objective" evidence in their research and writing. In many cases, oral history interviews are conducted many years distant from the narrator's experiences, and his or her memory of events may have faded over those years. Personal experience prior to or following the events often shapes and filters the memory of one's experiences, and narrators are also subjected to the subtle—if unintentional—intricacies of the interview process, such as the interviewer's methods of questioning, the environment in which the interview takes place, and other factors. Having said that, however, serious historians recognize the limits of all sources, documentary and otherwise, and are aware that they should never depend on just one type of source in their research. In the hands of a responsible historian, and used judiciously in combination with other sources, oral history interviews provide a very valuable contribution to the arsenal of historical sources available.

Military History Collections

Over the past several decades, oral history has made a tremendous impact on the writing of military history. All U.S. military branches have embraced the oral history interview to some degree, initially to aid in the writing of official military history—that history commissioned by the U.S. government or the military branches. During World War II, the U.S. Army assigned historians to interview combat veterans in both the European and Pacific theaters in an attempt to fill in the blank spots in the official record. Understanding the importance of postbattle analysis for future military action, these historians—serving in combat historical teams assigned to the War Department Historical Section under the direction of

Lieutenant Colonel John M. Kemper—interviewed combatants both individually and in group settings to help provide a fuller accounting of particular battles.

Members of combat historical teams, influential historians such as James MacGregor Burns, Martin Blumenson, and especially Forrest Pogue and S. L. A. Marshall, devised systems for interviewing combatants and reported their findings to higher headquarters to promote study of "lessons learned" during the war. The combat historian has maintained a presence in war zones in all conflicts since World War II and continues to provide invaluable oral evidence that will serve future generations of military historians. The greatest collection of oral history interviews commissioned by the U.S. Army is conducted and maintained by the U.S. Army Center of Military History.

Other services have embraced oral history, notably the U.S. Marine Corps during the Vietnam War. In a long series of issue-specific interviews with marines returning from duty in South Vietnam in the 1960s, the U.S. Marine Corps commissioned interviews covering specific issues involving the corps' presence in Vietnam, and these are housed in the U.S. Marine Corps History and Museums Division Oral History Collection. Likewise, the U.S. Air Force conducted oral history interviews with returning veterans from Southeast Asia, and these interviews can be found at the U.S. Air Force Historical Research Agency. Additionally, the National Museum of the Marine Corps has been conducting oral history interviews with marines since the 1960s, including marines from World War II through the country's most recent conflicts. The oral history collections held by the U.S. Navy at both the U.S. Naval Institute and the U.S. Naval History and Heritage Command are especially impressive and contain interviews with a great variety of veterans. One should also consult the extensive holdings of the U.S. Coast Guard Oral History Program to provide a fuller account of U.S. military maritime history.

The proliferation of oral history within the armed services has brought about positive change in the study of military history. The original motives for collecting oral history interviews were twofold: (1) to help understand how battles unfolded, how service personnel performed, and how to fight more effectively (both in the short and long terms) and (2) to provide a reservoir of primary source material to aid in the study of past conflicts. By using oral

history in its collective effort to learn from the past, the U.S. military tapped a wellspring of previously unknown material that brought about unforeseen results. Not only did the oral recollections provide numerous rich perspectives, they also showed the complexity of combat operations, especially through the often contradictory recollections of different individuals. This fact has spurred deeper research in these cases where individuals' memories differ in an effort to substantiate the differing claims, resulting in a more complex and nuanced view of military history.

In addition to the richer historical understanding provided by oral history, military history has been able to evolve along historiographical lines that have enabled the field to remain "relevant" and more mainstream in the larger study of history. Although certainly worthy of study in and of itself as a major and often defining entity within societies throughout time, the history of the military in the United States has, with the help of oral history, been reflective of the larger shift in historical study to a "history from below" approach. Though many early efforts in the field of military oral history focused on attaining the recollections of general officers and other top commanders, since the 1960s oral historians have collected the oral memoirs of men and women of all ranks, positions, levels of education, race, ethnicity, and various other defining characteristics.

Emanating from this, numerous subfields have emerged in military history. Imagine studying African American veterans' experiences in the Vietnam War, or the Japanese American experience in World War II, without access to oral histories. Prisoner-of-war studies would be an immensely weaker area of study without recourse to oral history interviews, as would studies of soldier motivation or those focusing on psychological trauma caused by combat; the list can go on almost indefinitely. Military history has long been maligned for its practitioners' seeming obsession with operational history, but oral history has helped infuse a vitality to the field as new areas of study abound, and important historically sound work is being produced in these new areas. Through this effort to record the history of "average" service personnel, oral historians have helped produce a wealth of materials that not only help us detail daily life in the American military, or even the terrible, tragic, chaotic, and heroic events of battle, but have also provided a way to study individual and collective memory in the military.

Other Oral History Projects

As a result of the popularity and utility of oral history, many nonmilitary institutions have been collecting and preserving interviews related to military matters. The U.S. Library of Congress instituted the Veterans History Project in 2000, and this massive oral history effort has collected thousands of interviews with American veterans who served in all of the conflicts of the 20th and 21st centuries. Most other large oral history archives are housed within and sponsored by American universities throughout the country. These oral history projects are typically led by trained oral historians with the goal of providing current and future generations with as broad an array of diverse perspectives as possible. Some of the most notable projects are the Rutgers Oral History Archives, the Oral History Research Office at Columbia University, the Regional Oral History Office at the University of California at Berkeley, the University of California at Los Angeles's Center for Oral History Research, the Louie B. Nunn Center for Oral History at the University of Kentucky, and the Samuel Proctor Oral History Program at the University of Florida. These are all broad-based collections, and they do not focus specifically on military history, but they include thousands of interviews with veterans of many conflicts.

Other oral history projects focus more narrowly on military matters. The Oral History Project at the University of North Texas houses an extensive collection of interviews with veterans of the Second World War, especially those who served in the Pacific Theater. The United States Military Academy's West Point Center for Oral History was created in 2009 and will serve as a major repository of interviews with graduates of the academy. Likewise, the Citadel Oral History Program, founded in 2008, will collect and preserve interviews for generations. The U.S. Latino & Latina World War II Oral History Project at the University of Texas has conducted hundreds of interview with veterans of the Second World War, and it is collecting interviews with veterans of the Korean and Vietnam Wars. The largest and most impressive collection of Vietnam War-related oral history interviews is at the Vietnam Center and Archive at Texas Tech University. The Louie B. Nunn Center for Oral History has initiated a major project for the collection of interviews with veterans of the conflicts in Iraq and Afghanistan. The History Division of the U.S. Marine Corps has

conducted and preserved more than 1,500 interviews with participants in Operation Iraqi Freedom, and the U.S. Army's Center of Military History has a major collection of interviews with veterans of both Operation Iraqi Freedom and Operation Enduring Freedom. The U.S. Air Force Historical Studies Office also maintains a large and growing collection of interviews concerning these conflicts. There are also numerous state and local efforts throughout the country to collect the reminiscences of veterans, reflecting society's desire to learn more about the country's veterans and their experiences. All these efforts to collect and preserve oral history interviews have had a tremendous impact on the way we study and understand the history of the country's military institutions, as well as how we regard and come to understand America's veteran community.

ORGANIZATION, COAST GUARD

Coast Guard headquarters is in Washington, D.C. The commandant of the U.S. Coast Guard is an admiral (a four-star equivalent). The vice commandant is a vice

admiral (a three-star equivalent) and serves as acting commandant in the absence of the commandant. This entry discusses the organizational structure of the U.S. Coast Guard.

The deputy commandant for mission support (who oversees logistics, acquisition, and human resources) and the deputy commandant for operations (who oversees service operation policies) are also headquartered in Washington. The Force Readiness Command based in Norfolk, Virginia, is responsible for command training units, schools, and training centers.

The Coast Guard reorganized its operational structure in 2007. The U.S. Coast Guard's operational force is now organized into the Atlantic and the Pacific commands. Each is commanded by a vice admiral. The Atlantic Command consists of District 1 (New England, eastern New York, and northern New Jersey), District 5 (Pennsylvania, southern New Jersey, Delaware, Maryland, Virginia, and North Carolina), District 7 (South Carolina, Georgia, eastern Florida, Puerto Rico, and the U.S. Virgin Islands), District 8 (all inland waters in the United States, the Gulf of Mexico), and District 9 (the Great Lakes). The Pacific Command includes District 11 (Arizona, California, Nevada, and Utah), District 13 (Idaho, Montana, Oregon, and Washington), District 14 (Hawaii and U.S. Pacific territories), and District 17 (Alaska).

In 2007, the service established the Deployable Operations Group—the DOG. The DOG places all specialized deployable Coast Guard assets under a single unified command. The Coast Guard's goal is to be able to deploy four “tailored” force packages. A tailored force package would include a mix of ships, aircraft, and special training for tactical missions. The DOG includes the National Strike Force, which manages the service's specialized assets for responding to oil spills and hazardous materials. In addition, the DOG includes two other subordinate commands. One is oriented on the Atlantic Command and the other on the Pacific Command. Each includes Marine Safety and Security Teams, Port Security Units, and Deployable Patrol Boat Squadrons.

The U.S. Coast Guard Reserve is the reserve component of the service. It is organized, trained, and administered under the Coast Guard Headquarters.

The U.S. Coast Guard is also supported by the Coast Guard Auxiliary. The auxiliary is a volunteer organization established by Congress to assist the

U.S. Coast Guard. Auxiliarists perform a range of duties from participating in search and rescue to assisting in the mobilization of the Coast Guard Reserves. The auxiliary members are in all 50 states, Puerto Rico, the Virgin Islands, American Samoa, and Guam. The auxiliary is organized into flotillas (local groups of at least 15 members) and divisions (five or more flotillas). Flotillas and divisions are aligned with Coast Guard Districts. Although the auxiliary operates under the Coast Guard, it has its own board of national officers, which constitute the Auxiliary Headquarters.

ORGANIZATION OF AMERICAN STATES

Created in April 1948, the Organization of American States (OAS) is a regional intergovernmental organization of sovereign nations ranging across the Western Hemisphere. It succeeded the Pan-American Union, one of the oldest regional blocs, which was formed in 1890 during the Pan-American Conference. Pan-Americanism is an old continental goal, dating from the Monroe Doctrine and Bolivar's Panama Congress

in the 1820s. The OAS was created in response to post–Second World War security issues. Approved at the Conference of Bogotá, its charter encompassed contemporary concerns about the threat of communism. Two competing forces shaped the organization: (1) the division of nations around the world into two hostile blocs of influence and (2) the creation of the United Nations. These prompted the organization of a hemispheric institution firmly committed to regional safety, as set forth in the charter, “to achieve an order of peace and justice, to promote their solidarity, to strengthen their collaboration, and to defend their sovereignty, their territorial integrity, and their Independence” (OAS, 1967, Pt. 1, chap 1, Article 1, p. 1). This entry discusses the structure, missions, and actions of the OAS.

The OAS headquarters are located in Washington, D.C. They house the General Assembly, the Permanent Council, the Inter-American Economic and Social Council, the Inter-American Council for Science and Culture, the Inter-American Juridical Committee, the Inter-American Commission on Human Rights, and the General Secretariat. The Permanent Council is a committee composed of one representative with ambassadorial status from each member-state. It is responsible for supervising the General Secretariat as well as for overseeing relations among members and ties with other international organizations. The general secretary is responsible for coordinating OAS projects. An elected official, the general secretary receives a 5-year mandate, with the possibility of one additional term. In addition to permanent institutions and staff, special councils, committees, and meetings may gather periodically to discuss specific matters, such as the Consultation of Ministers of Foreign Affairs convened to discuss crises affecting the security of member nations. The General Assembly is the highest organ of the OAS. It convenes regularly in a selected member country to consider an agenda drafted by the Permanent Council. Among other tasks, it determines organizational spending and members' contributions. The OAS is governed by a charter, which has been amended several times since 1948.

Challenges

During its first decades, the organization was a secondary institution within the Inter-American system as U.S. Cold War policies weakened OAS authority

by supporting military coups and the establishment of authoritarian regimes throughout the hemisphere. In 1954, the United States supported a coup against reformist president Jacobo Arbenz in Guatemala. During the 1960s, the OAS faced its first serious challenges. Tensions between the United States and the Cuban revolutionary regime underlined the connections between underdevelopment and social instability. Poverty became a tangible issue confronted by coordinated policies. The establishment of the Alliance for Progress, announced by President John F. Kennedy in 1961, represented the first hemispheric program connecting representative democracy, economic development, and social justice. The OAS fully embraced that agenda. Member nations were encouraged to enroll and adopt recommended protocols. Despite ambitious goals, few countries benefited effectively from these policies and, by the end of the decade, the alliance was no more than a vanished hope. Counterinsurgency surpassed social transformation as a regional priority and most governments invested heavily in military training and weaponry instead of improving standards of living or access to land for impoverished populations.

In certain political arenas, the OAS aligned with the U.S. government. It banned the Marxist Cuban regime from membership, and supported the U.S. invasion of the Dominican Republic (April 1965) when a majority of delegates voted for Operation Push Ahead, the replacement of U.S. forces by inter-American armed forces. However, in spite of OAS support, U.S. intervention in the Dominican Republic did not receive support from the governments of Mexico, Chile, Uruguay, and Venezuela. These constituted important abstentions by OAS founding members. (Intervention was also criticized by U.S. liberal congressmen, including Democratic Senator Robert Kennedy.) Less significant was OAS mediation of the Soccer War (June–July 1969), an armed conflict between Honduras and El Salvador that ended in a negotiated cease-fire. Despite its purported defense of democratic values and governments in the Western Hemisphere, the OAS did little to stop the spread of military dictatorships in Latin America and consequent human rights abuses during the 1960s and 1970s. Clearly, Cold War worries trumped democratic aspirations.

A second wave of Cold War interventions, sanctioning coups and supporting corrupt regimes, opposed U.S. interests to many Latin American

governments. These actions brought OAS authority to its weakest point. During the administration of Ronald Reagan (1981–1989), U.S. foreign policy worked to destabilize the Sandinistas in Nicaragua. Reagan sponsored an anti-Marxist Nicaraguan force, the Contras, while assisting anti-Communist governments in Honduras, El Salvador, and Guatemala. In October 25, 1983, a combined force commanded by U.S. troops invaded Grenada, a small island in the Caribbean. The invasion was criticized by the United Kingdom, Canada, and the UN General Assembly. A proliferation of regional sub-blocs was the main response to the escalation of violence in Central America and the Caribbean. Among them, the Contadora Group (1983) and what became known as the Arias Costa Rica Plan (1987) sought the achievement of regional peace through negotiation.

Redemocratization during the 1980s and the Cold War's end (1989) opened a window for renovation, confronting the Americas with a new set of agendas and issues. The fall of the Soviet Union brought a reevaluation of interventionism as a U.S. policy. Counterinsurgency no longer provided an important issue. At the same time, emerging democracies learned that economic development alone was insufficient to overcome the unequal distribution of wealth or to combat regional inequality. In more developed countries such as Brazil, Argentina, and Mexico, industrialization accelerated rates of migration, urbanization, and income concentration. New problems such as urban sprawl, with accelerated growth of shantytowns and other forms of precarious habitation, promoted functional unemployment, drug use, crime, and even deforestation. Economic recession and the debt crisis aggravated the situation. Economic growth rates were difficult or impossible to sustain under the traditional import substitution pattern. Globalization and liberalization promoted free markets, sometimes at high social costs. Consequently, the concept of national and regional security changed with the end of the Cold War from basic counterinsurgency to broader notions of public safety, human well-being, and civil rights. Of special significance for this shift was the Inter-American Democratic Charter, adopted during the Conference of Lima in 2001, which affirmed in its first article that "the peoples of the Americas have a right to democracy and their governments have an obligation to promote and defend it" (OAS, 2001, Pt. 1, Article 1).

During the so-called lost decade (1980s), broad political competition developed among most member nations. In the context of expanding political rights and promoting democracy, the OAS undertook election supervision as one of its main responsibilities. Election monitors are still sent to member nations to follow ballot returns, reinforcing the role of the OAS as trusted arbiter in political disputes. The organization also worked with humanitarian agencies and stabilization missions to coordinate material support in response to human and natural catastrophes in Haiti, Honduras, El Salvador, Guatemala, and Chile. Although Latin America does not have a tradition of organized violence between states since the 19th century, disputes emerge from time to time. Peacekeeping actions minimize the threat of armed conflicts between member-states. The OAS was involved in mediations in border conflicts between Peru and Ecuador and, most recently, between Venezuela and Colombia, although the last one would be successfully mediated by UNASUR (Union of South American Nations), a regional organization initiated by South American governments.

Tentative efforts to combat drug traffic and confront the cartels and guerrilla forces profiting from it were less effective. The invasion of Panama by U.S. forces and the ouster of General Manuel Noriega (December 20, 1989) were condemned by the majority of OAS member-states. This action was clearly not consensual. Latin American governments feared that such direct political and military intervention in Central America foreshadowed a return of U.S. interference in the internal affairs of the region that had exemplified the gray days of the Roosevelt Corollary, an early-20th century doctrine that asserted the right of the United States to intervene in Central America and the Caribbean to stabilize economic affairs and prevent European intervention. Thus, emerging left-oriented governments often distrusted OAS drug enforcement policies. Suspicions grew out of normal deliberations over national sovereignty as well as conflicting notions regarding the place of coca agriculture in national traditional culture, particularly in countries like Bolivia and Ecuador with large indigenous populations. The Colombian raid against a Revolutionary Armed Forces of Colombia (Fuerzas Armadas Revolucionarias de Colombia or FARC) rebel camp across the border in neighboring Ecuador showed how radically different political and social conceptions of drug dealers and guerrillas pushed

countries to the verge of war. The OAS worked to neutralize such tensions. Yet a fundamental conflict lies in two opposing visions concerning the role of the OAS: U.S. officials see the organization as an influence, while many Latin American nations perceive the organization as a way to limit U.S. interference in the region.

Recently, the OAS failed to mediate a negotiated solution for the political crisis in Honduras caused by the overthrow of President Manuel Zelaya by a civil military junta on June 28, 2009. Despite OAS condemnation and international protests, the junta conducted its own presidential elections and installed a new government purged of Zelaya's influence. Currently, a new Honduran ambassador was seated at the OAS, although many Latin American governments still refuse to recognize the new regime.

The Changing Focus of the OAS

The coming years will witness changes in the structure of the OAS, creating room for regional integration and differentiation. As the international political scene evolved from the Cold War to the wars against drugs and terrorism, the United States shifted its attention to other areas of the globe, withholding funds from the OAS. This redirection of American foreign policy enabled pluralism in OAS deliberations and a more even division of responsibilities among the sister nations. Operational reconfigurations will cause inevitable changes in the overall budget and revisions to current members' contributions. The struggle against institutional corruption, the concentration of wealth, the declining state of public security, and environmental issues will likely constitute the main challenges that shape the OAS in the short run. Its future viability will depend on developing creative and effective approaches to counter these challenges.

OTTAWA LAND MINE TREATY

The Convention on the Prohibition of the Use, Stockpiling, Production and Transfer of Anti-Personnel Mines and on their Destruction, informally known as the Ottawa Convention or the Ottawa Treaty, was signed by 122 nations in December 1997 and focused on the complete abolition of a particular class of weaponry—antipersonnel (AP) land mines. It was not the first international law convention or treaty aimed at limiting these weapons, but as the call for the convention was prominently supported by several international luminaries—most notably, Diana, the Princess of Wales—the Ottawa Treaty is probably the most well-known of these efforts. The treaty was also championed by the International Campaign to Ban Landmines, a nongovernmental organization advocating for a global ban on AP mines and cluster munitions, which was awarded the Nobel Peace Prize in recognition of its efforts to bring about the treaty. This entry discusses the origins of the treaty, its articles and amendments, and criticisms.

The critical precursor to the Ottawa Treaty is the UN-convened Convention on the Prohibition or Restrictions of Use of Certain Conventional Weapons Which May Be Deemed to Be Excessively Injurious or to Have Indiscriminate Effects (the Convention

on Conventional Weapons, or CCW), adopted in October 1980 after an 85-nation conference, which included the United States. One of the CCW's subsections is the Protocol on Prohibitions or Restrictions on the Use of Mines, Booby Traps and Other Devices, known as Protocol II. Protocol II—which took effect in December 1983, with 36 countries as initial parties—did not completely abrogate AP mines but was intended to protect civilian populations and UN personnel from their hazards, particularly indiscriminate usage that made no differentiation between combatants and noncombatants. The United States has ratified Protocol II.

During the same timeframe that Protocol II was being negotiated and took effect, however, various wars and civil wars took place in which AP mines were used intentionally or indiscriminately against civilians. These included conflicts in Afghanistan, Angola, Bosnia and Herzegovina, Cambodia, Georgia/South Ossetia, Kosovo, Iraqi-held Kurdistan, and Rwanda. Protocol II was criticized as having few clear definitions, as lacking any verification and enforcement processes, and, by its terms, as being inapplicable to virtually all civil wars and internal conflicts. The frequency of “terror mining” against civilian populations led prominent spokespersons like Jody Williams of the Vietnam Veterans of America and the Princess of Wales to seek a campaign to seek an outright prohibition on AP mines and similar weapons, which led to the founding of the International Campaign to Ban Landmines.

In May 1996, the CCW's first review conference adopted significant amendments to Protocol II to correct the original protocol's shortcomings. Most important, Amended Protocol II now covers internal armed conflicts like civil wars and insurgencies. Among the numerous features of Amended Protocol II, AP mines designed to explode on detection by electromagnetic sources were banned outright, clear duties were assigned for demining, all land mines were required to be detectable, with a 9-year period set for signatory states to meet the new standards, controls were added for remotely deliverable (“scatterable”) mines, all unmarked AP mines were required to be “smart” (i.e., 90% must self-destruct within 30 days of emplacement), and additional protections for civilians and noncombatants were added, requiring that all feasible efforts be taken to protect civilians from mine warfare. However, Amended Protocol II, like its predecessor, does not

categorically ban all AP mines, and its verification mechanisms were still criticized for lacking solid enforceability.

The Ottawa Conference was convened in October 1996, with 74 nations participating. The treaty drew heavily from Amended Protocol II but contained several far-reaching provisions beyond the scope of its 1996 precursor. The treaty's Article 1 requires each signatory nation to agree, "never under any circumstances," to use AP mines; to develop, produce, otherwise acquire, stockpile, retain or transfer to anyone, directly or indirectly, AP mines; or to assist, encourage, or induce, in any way, anyone to engage in any activity prohibited to a party under the convention. The treaty also requires each signatory party to agree to either destroy or ensure the destruction of all of its AP mines in accordance with the convention's terms.

For the Ottawa Treaty's purposes, *AP mine* means a mine designed to be exploded by the presence, proximity, or contact of a person and that will incapacitate, injure, or kill one or more persons; antitank mines and other non-AP mines fitted with antihandling devices (i.e., "booby traps") are expressly excluded from its terms, as are command-detonated mines like the U.S. M18A1 Claymore command-fired ("ambush") mine. Besides stopping the production and development of AP mines, under Article 4, each signatory nation is given 4 years to eliminate fully its AP mine stockpile. Under Article 5, moreover, each state that becomes a party to the treaty must clear all AP mines from all mined areas under its jurisdiction or control "as soon as possible" but generally no later than 10 years after the treaty enters into force as to that nation. The Ottawa Treaty also contains several provisions cross-referencing and requiring compliance with Amended Protocol II.

Article 3 provides the option to each signatory to retain a small number of mines for purposes of training in mine clearance and detection. Each signatory nation accepting this option is required to report the numbers of mines kept for this purpose; 64 countries have accepted the option, declaring a total of 289,000 AP mines to the UN secretary-general for purposes of complying with Article 3; 23 other signatories have not declared any figures. Articles 7 and 8 contain extensive provisions requiring measures intended to provide transparency in review and

reporting as to the implementation of and compliance with the treaty's terms by each signatory.

The Ottawa Treaty took effect in March 1999, 6 months after the 40th nation had ratified it. As of 2009, 156 nations had formally ratified the treaty; 2 had signed but not ratified it, and 37 others, including the People's Republic of China, India, Russia, and the United States, had not yet enacted the treaty. Criticisms raised by such nations that have not signed include that the ban imposed by the treaty is overinclusive, in that it takes away all usage of AP mines, including self-destructing "smart" mines, from nations that have not abused the CCW, Protocol II, or other international laws of warfare, and that "rogue" states and terrorist groups will refuse to abide by the ban in any event. The United States has not signed the Ottawa Treaty, despite 1994 statements by President Bill Clinton that ridding the world of land mines was a top U.S. arms control priority. The U.S. government's long-standing objection to ratification of the Ottawa Treaty is that it contains no "Korean Peninsula" exception to the Ottawa Treaty, stating that the more than 1 million mines planted in the Demilitarized Zone between the two Koreas are required for peacekeeping purposes. Similar concerns have periodically been offered by the U.S. military as to the continuing presence of an AP mine belt outside the Guantanamo Bay naval base in Cuba.

P

PAKISTAN

The country of Pakistan (in Urdu and Persian meaning “Land of the Pure”—a term coined in 1933 by Chaudhary Rahmat Ali, a Muslim movement activist) was to be formed, theoretically, out of the Muslim populations of British India. These populations—or the elites among them—had at times ruled over the Hindu populations of the Indian subcontinent, notably in the course of a succession of Muslim empires in South Asia. The last of these was the Mughal Empire, which ruled from the 16th to the 19th centuries, the architectural apotheosis of which was the creation of the Taj Mahal under Emperor Shah Jahan. The decline of the Mughal Empire, starting in the 18th century, left it an empire in name only as it gave way to the British East India Company. The Sepoy Rebellion in 1857, in which both Hindus and Muslims participated, spelled the end of the East India Company’s rule and its replacement by the British government itself. This direct rule became known as the British Raj, which lasted until the British gave up the Indian subcontinent in 1947. This entry discusses the history, government, and armed forces of Pakistan and Pakistan’s relationship with Afghanistan, India, the United States, and other countries.

Background and Creation of Pakistan

The idea of a separate state for Muslims dates from the anticolonialist period in India prior to World War II, under the leadership of Mahatma Gandhi.

In 1930, Mohammed Iqbal, who is honored as the national poet of Pakistan, advanced his dream of a separate state for Muslims, who, he argued, could not trust the Hindu majority to treat them on an equal basis. Later, as Pakistan was to achieve its independence in the aftermath of World War II, a secular barrister, Mohammed Ali Jinnah, was the driving force behind the Muslim nationalist movement. He became known as the Quaid-i-Azam—the “great leader.”

However, the division of the subcontinent was neither complete nor peaceful, in part because of Great Britain’s haste in ending its colonial rule so that it could turn its attention to national recovery after 5 years of war: Large Muslim populations were left behind in India as a result of the partition. The population transfers that did take place, especially in the relatively prosperous Punjab, among Muslims, Hindus, and Sikhs, as well as in the east in Bengal, were accompanied by scenes of mass murder that worsened the intercommunal atmosphere; the disposition of the princely states in India—theoretically outside British rule—worked to the disadvantage of the Muslims, notably in Kashmir, where the state was turned over to India by its Hindu maharajah despite the fact that its population was heavily Muslim; and finally, the state of Pakistan was created in two pieces—West Pakistan (now the Islamic Republic of Pakistan) and East Pakistan (now the People’s Republic of Bangladesh)—separated by 1,500 miles of Indian territory.

Today, the population of Pakistan (i.e., the former West Pakistan) is upward of 170 million people, the sixth most populous state in the world and the

second most populous Muslim state, after Indonesia. By 2030, Pakistan is expected to surpass Indonesia and become the largest Muslim state by population. (The Muslim population in India is about the same as that of Pakistan and represents about 14% of the total population of India.)

In the process of partition (1947), Pakistan had to be created from scratch, out of the body of "Mother India." Government institutions, buildings, monuments, and other relics of British rule remained in India. Initially, the Pakistani capital was located in the port city of Karachi, and then in the 1960s, a new Pakistani capital, Islamabad, was created alongside the city of Rawalpindi. The assets of the army and the civil service were divided between the two countries. Having rejected its former identity as part of India and its government institutions and, more generally, having rejected their common Muslim and non-Muslim heritage, Pakistan's default identity has gradually moved, for many of its citizens, toward radical Islamism.

Pakistan has a 650-mile coastline along the Arabian Sea and the Gulf of Oman in the south. In the west, it is bordered by Afghanistan and Iran. In the east, it is bordered by India and in the far northeast, by China. In the north, Tajikistan lies adjacent to Pakistan but is separated by the narrow Wakhan Corridor.

Pakistan's history has been punctuated by three wars (1948, 1965, and 1971) and a skirmish (1990) with India, in all of which Pakistan came out on the short end.

Economy

Pakistan has a semi-industrialized economy, which is ranked the 27th largest in the world. However, it remained for a long time impoverished due to internal political disturbances and negligible foreign investment. With a rise in development spending by the Pakistani government, the country's poverty levels were reduced by 10% from 2001 to 2007. The gross domestic product (GDP) grew from 5% to 8% from 2004 to 2007. This was largely due to development in the industrial and service sectors. However, the period after 2007 witnessed considerable political and economic instability, leading to a depreciation of the Pakistani rupee. The growth of the economy was affected once again during the 2008 global economic recession.

Since 1948, the United States has provided more than \$20 billion in direct aid to Pakistan, nearly half of which has gone for military spending. This aid has been cut off or reduced on several occasions, chiefly in disapproval of Pakistan's development of nuclear weapons. The net effect has been an ambiguous and conflicted relationship, although Pakistan is still designated as a "major non-NATO ally" of the United States. In the wake of the killing in May 2011 of Osama bin Laden, who had been living for 5 years in Pakistan, the Obama administration said it would withdraw one third of its military assistance to Pakistan, or some \$800 million, which would include \$300 million for counterinsurgency programs.

Government and Politics

Constitutionally, Pakistan is a federal parliamentary republic, made up of four provinces, namely, (1) Baluchistan, (2) Khyber Pakhtunkhwa, (3) Punjab, and (4) Sindh, and four federal territories, namely, (1) Islamabad Capital Region, (2) Federally Administered Tribal Areas (FATA), including the Frontier regions, (3) Azad Jammu and Kashmir, and (4) Gilgit-Baltistan. With the adoption of its constitution in 1956, Pakistan became an Islamic republic, while remaining in the Commonwealth of Nations. In addition, it is a member of the United Nations, a founding member of the Islamic Conference Organization, and a member of the G20 group of leading and emerging economies.

Though Pakistan, like India, began as a parliamentary democracy, unlike India it succumbed to military rule. Four times the army took over: (1) in 1958–1969, the regime of Ayub Khan; (2) in 1969–1971, the brief regime of Yahya Khan, following the breakaway of East Pakistan, which became Bangladesh; (3) in 1977–1988, the regime of Zia-ul-Haq, who overthrew the 5-year-old civilian government of Zulfikar Ali Bhutto and had him executed; and (4) in 1999–2008, the regime of Pervez Musharraf, after overthrowing the regime of Nawaz Sharif, who had alternated as prime minister with Bhutto's daughter, Benazir Bhutto, during the 1990s. She was later assassinated in 2007 as she was campaigning to become prime minister again.

After the assassination of Benazir Bhutto, parliamentary elections were temporarily postponed, but when they were held in 2008, her Pakistan Peoples

Party won a majority of votes and formed a coalition government with the Pakistan Muslim League. Yousuf Raza Gilani became the prime minister. In August 2008, General Pervez Musharraf resigned as president and went into exile in London after he had been threatened with impeachment over his conflict with the judiciary. In the presidential election that followed, Asif Ali Zardari (widower of Benazir Bhutto) of the Pakistan Peoples Party was elected president by a wide margin.

Political Relationship With the United States

The political relationship between the United States and Pakistan has repeatedly had its ups and downs. There has been distrust, compounded by Pakistan's inferiority complex vis-à-vis India and the perceived lack of diplomatic support by the United States, notably with regard to Pakistan's dispute with India over the Kashmir issue.

In the early days of the Cold War, Pakistan allied with the United States through its adherence to two defensive pacts aimed at containing the Soviet Union: (1) the Central Treaty Organization in the Middle East and (2) the Southeast Asia Treaty Organization. The high point in Pakistan's relation with the United States was in 1971, during the war with India; at that time, Secretary of State Henry Kissinger openly advocated that the United States should "tilt toward Pakistan." This, however, remained in the realm of rhetoric. Pakistan lost not only the war but also its province of East Pakistan. At the same time, and throughout the Cold War, America's relation with India remained frosty. As a leading member of the Non-Aligned Movement, India adhered to the anti-American line of that movement.

In the 1970s, new developments arose that complicated U.S.-Pakistan relations. The first was the developing tie between Pakistan and China, which for the former was motivated by a wish to counterbalance India. The second was the arrival on the scene of Zulfikar Ali Bhutto, who shifted Pakistan's rhetoric in the direction of the Third World and somewhat away from the West, all the while intensifying Pakistan's relationship with China. Third, Pakistan sought to acquire nuclear weapons capability, a so-called green or Islamic bomb, which it later managed to achieve through the efforts of a Pakistani nuclear scientist, Abdul Qadeer Khan.

Yet another era in U.S.-Pakistan relations opened up at the end of the 1970s, with the Soviet invasion of Afghanistan. As a Muslim country on Pakistan's border and with a common ethnic group, the Pashtuns, Afghanistan is considered by Pakistan to be rightfully within its sphere of influence and to constitute its "strategic depth"—as always, vis-à-vis India. The joint U.S.-Saudi-Pakistani sponsorship of the Afghan mujahideen insurgency against the Soviet occupation will be treated separately in this entry.

Still another change in the political relationship between the United States and Pakistan occurred in the aftermath of the terrorist attacks on the United States on September 11, 2001. The attacks were planned and launched from Afghanistan, and with Pakistan offering the best access to that country, President Pervez Musharraf was prevailed on to give his support to the Global War on Terrorism launched by the United States against al Qaeda, the organization led by Osama bin Laden that was behind the attacks, and its protector in Afghanistan, the Taliban, a movement sponsored by the Pakistanis in the 1990s as a means of ending the disorder that followed the withdrawal of Soviet troops from the country and of establishing the Taliban as its proxy of influence in Afghanistan.

But at the same time, in the years that followed the 9/11 attacks, Pakistan felt compelled to maintain tenuous links to the Taliban and other terrorist organizations in Afghanistan that had been essentially the fundamentalist part of the mujahideen movement against the former USSR in the 1980s. Despite these continuing relationships, Pakistan had to face increasing threats from a home-grown Taliban organization that had assassinated Benazir Bhutto, the emerging civilian successor to the ousted Musharraf, and continued to carry out a series of attacks against Pakistani government installations and personnel.

Nearly 10 years after 9/11, Osama bin Laden was discovered and killed in a unilateral American operation deep inside Pakistan, in a villa in the garrison town of Abbottabad. In addition to deeply offending the Pakistanis as a breach of the country's sovereignty, the operation raised the question of whether bin Laden had been sheltered there for years by an element of the Pakistan government, or more specifically by its intelligence service, the Inter-Security Intelligence Directorate, the ISI. The question remains unanswered.

Military Forces

Pakistan's armed forces rank as the eighth largest in the world. The armed forces consist of the separate branches of the army, the navy, and the air force, as well as a number of paramilitary formations that carry out internal security functions and border controls. The Pakistan army, now headed by General Asfaq Parvez Kayani, has an active-duty force of 612,000, plus 513,000 personnel in reserve. Conscription is not in effect but can be instituted in times of emergency. The army is generally considered the most efficient of Pakistan's governmental institutions.

Pakistan is the only country with a Muslim majority that possesses nuclear weapons. The National Command Authority is responsible for the protection and deployment of Pakistan's nuclear forces. In the past several years, Pakistan has sharply increased the number of its nuclear weapons and is now estimated to possess around 100 of them. In addition, Pakistan is believed to be expanding its fissile material stockpile at a higher rate than any other country at present. Pakistan considers that this nuclear capability has brought it up to a strategic parity with India, which the latter does not consider to be the case.

During the Arab-Israeli wars, Pakistan Air Force pilots participated on the Arab side, notably in the Six Day War of 1967. In the subsequent Yom Kippur (aka Ramadan) War in October 1973, Pakistan Air Force pilots again volunteered, but by the time they arrived, Egypt had already agreed to a cease-fire.

Pakistan and Saudi Arabia have a close military relationship. Pakistan provided a military contingent on Saudi soil as a protective force during the Persian Gulf War. Pakistan also considers itself to be a strategic ally of China, and the two countries conduct military exercises together. Additionally, the Pakistan armed forces have contributed to UN peacekeeping efforts and are at present the largest contributor, with 10,700 personnel deployed as of 2009.

The United States and the War in Afghanistan

The Central Intelligence Agency (CIA)-ISI relationship is unique, partly because the ISI, as a military organization within the Pakistani army, is the lead intelligence service in the country, unlike in many other countries where a civilian agency has the lead, as in neighboring India with its Research and Analysis Wing, and partly because the CIA, which is

characteristically in liaison with other civilian foreign counterparts, has a unique historical relationship with the ISI. This goes back to the 1950s and the U-2 espionage flights over the former USSR that originated in Peshawar, in Pakistan's Northwest Frontier Province (now known as Khyber Pakhtunkhwa). The CIA, as the sponsor and manager of the U-2 (a role later shifted to the U.S. Air Force), had to coordinate the operation of these flights with the Pakistani authorities, and in this instance, it was the ISI. Thus, the CIA-ISI relationship goes far back and, at least until recent years, has been largely unaffected by the stormy political relations that the two countries have experienced from time to time.

In the summer of 1979, Pakistan approached the United States for aid to the mujahideen in their uprising against the recently installed communist government. The result was a presidential finding of July 1979, signed by Jimmy Carter, authorizing the CIA to provide nonlethal aid to the mujahideen. This came to be done through the Pakistani authorities, which meant its liaison counterpart, the ISI. Immediately after the Soviet invasion at the end of the year, a new finding authorizing lethal aid was signed. The first arms—mainly Enfield .303 rifles—arrived in Pakistan on January 10, 1980, 14 days after the Soviet invasion.

As a means of keeping a fig leaf of what in intelligence parlance is called "plausible denial," arms furnished to the mujahideen were to be explained away as having been picked up on the battlefield; this meant only Soviet weaponry, apart from the Enfield. Later, in 1986, in a breach of this principle, American Stinger anti-aircraft missiles were provided, and these proved to be quite effective. President Carter had gradually increased the level of aid to the insurgents, and his successor, Ronald Reagan, expanded it considerably. Overall, U.S. covert-action funding for the war as of September 1989, after Soviet forces had left earlier that year, was estimated at about \$2 billion. This figure is probably on the low side.

The Afghan government headed by Mohammed Najib held on for 3 years after Soviet forces left, before being overthrown in 1992. As of January 1, 1992, both the Soviets and the Americans had ceased their aid to the Afghan factions, after the so-called negative symmetry agreement had been signed the previous September.

In the end, the zero-sum mentality evident throughout much of the region prevailed, and the opposing

sides in the Afghan struggle for power could not agree on a compromise settlement. Chaos ensued, and it was ended in 1996 after the Pakistanis sponsored Mullah Omar and the Pashtun-based Taliban as a means of restoring order in the country and ensuring Pakistan's paramount influence in Afghanistan.

During this period of interregnum, the United States, with its military assistance to the mujahideen ended, scaled back its interest in Afghanistan. The same was true for Pakistan itself. The Pressler Amendment cut off aid to Pakistan because of the latter's development of nuclear weapons. This cut-off was voided after the attacks of 9/11. One of the harmful effects of this cutoff of aid in the 1990s was that during this period Pakistani military officers were deprived of the opportunity, as in the past, to avail themselves of programs of training in the United States. This gap might well have produced cohorts of Pakistani officers who were comparatively less disposed toward friendship with the United States.

PANAMA

The country of Panama is strategically located in Central America, on the narrowest strip of land between the Atlantic and Pacific Oceans. Resembling

the letter S on its side, the Isthmus of Panama has been home to the eponymous Panama Canal since 1914. Panama's unique and advantageous geographical location has defined its economic, political, and social history for centuries. Along with the Suez Canal, the Panama Canal has been one of the two most important artificial waterways in the world in terms of shipping volume and strategic importance. This entry discusses the history and economy of Panama, its relationship with the United States, and the Panamanian Public Forces (PPF).

History, the Panama Canal, and Economy

Since the Spanish colonization of the region at the beginning of the 16th century, Panama has played a crucial role as a crossroads of commerce as well as a geopolitical point of contention between nation-states. Beginning with the U.S. completion of a French-begun canal in the early 20th century, Panama was for almost a century intimately tied to the foreign policy interests of the United States. From the 1903 treaty establishing Panama's independence and the Isthmian Canal Convention of 1904, which granted the United States occupation and control (as "if it were the sovereign") of the 16-kilometer-wide Canal Zone, to the December 31, 1999, U.S. turn-over of the canal to Panama, the United States maintained six military bases and an infantry brigade in the zone. For most of this period, Panama exercised little real sovereignty over this portion of its country.

In addition, the country's geography has been a strong determinant in its economic development. Panama's economy is unique to the region. Unlike other Central American countries, Panama has never been greatly dependent on agricultural exports because its geographic centrality has meant that mercantile and, later, financial activities would be dominant. Agricultural activities comprise less than 10% of the gross domestic product, while canal revenues and related financial and service industries make up 80%. Light manufacturing makes up the remaining economic activity. The canal and its associated commerce have attracted more than 100 international banks to Panama, which has resulted in Panama City sometimes being referred to as the "Switzerland of Latin America" for both its financial importance and its traditional banking secrecy and incorporation laws. The canal has brought other benefits, such as allowing Panama to become

home to the world's largest ship registry, currently with more than 10,000 vessels registered. In addition, Panama enjoys great monetary stability since it has used the U.S. dollar as its *de facto* currency since independence, though it is locally called the balboa.

The capital and largest city is Panama City, situated on the central southern coast on the eastern side of the Pacific terminus of the Panama Canal. Panama City is home to almost one third of Panama's 3 million inhabitants and thus functions as an archetypical primate city that dominates the country's economic, political, cultural, and social interests. Since the 1989 American invasion and the return of democracy, Panama has been a representative democratic republic, headed by a president who is elected by popular vote to a single 5-year term in office. The legislative branch consists of the unicameral National Assembly, which currently has 71 representatives, chosen by either single-member or plurality voting, depending on the locality.

Military Institutions and the Panamanian Public Forces

The advent of a Panamanian military institution coincided with the country's securing independence from Colombia in 1903 with U.S. assistance. However, at the behest of the United States, under the argument of the dangers of military politicization, the Panamanian military was disbanded the following year in favor of creating the National Police. As in much of Central America, Panamanian society was (and largely still is) dominated by a small, White, economic and political elite. Until 1968, Panama's military, under various names and in various forms, functioned as the ultimate arbiter of Panamanian politics, normally upholding elitist democracy.

In the late 1930s, under the leadership of Commandant José Antonio Remón, the National Police became increasingly a tool of political repression against protesting university students and an instrument of political pressure against challenges to the status quo. Nonetheless, the National Police played a key role in furthering the process of racial and social progress in that the majority of both officers and enlisted personnel were non-Whites. During Remón's tenure, the National Police received both more professionalization and extensive modernization from the United States to counter World War II

and, later, Cold War threats. During the 1950s, the institution was renamed the National Guard (*Guardia Nacional*), and true corporate growth occurred within the ranks through increased professional military training, accrued economic benefits for officers, and ever more political involvement.

A military coup in 1968 opened the way for the National Guard to become an instrument for increased nationalism vis-à-vis the overwhelming U.S. presence in the Canal Zone. Led by Major (and later General) Omar Torrijos, the National Guard instituted numerous labor, social, and general economic reforms focused on garnering the support of the poor and working classes. For the next 13 years, the U.S.-Panama relationship continued to worsen as Torrijos directed nationalistic rhetoric against Washington and increasingly sought to distance Panama from U.S. hegemony. The crowning achievement of this strategy was the signing of the 1977 Panama Canal Treaties, which promised to turn over the canal to Panamanian control on December 31, 1999.

However, Torrijos's sudden death in a plane crash in 1981 opened the way for a second chapter in military rule, this time led by Torrijos's former chief of intelligence, Manuel Noriega. A brutal Machiavellian dictator, Noriega possessed none of the folksy charm or natural political insight of his mentor. Though Noriega had worked for decades as a paid Central Intelligence Agency informant, his ascension to power challenged U.S. interests greatly. He renamed the military the Panamanian Defense Forces and furthered its transformation into his personal guard, shredding all semblance of civil rights and beating the political opposition. On the pretext of defending democracy, combating drug trafficking, and protecting the integrity of the Canal Treaties, the United States invaded Panama on the morning of December 20, 1989. Using overwhelming firepower, the United States quickly routed the National Guard and arrested Noriega after a brief standoff at the Papal Nunciature.

Besides a return to democracy, the American invasion was the catalyst for a dramatic shift in Panama's military history. Today, Panama is one of the two Latin American countries (together with Costa Rica) that have permanently abolished their militaries. The Panamanian Defense Forces were dissolved by a constitutional amendment in 1994. Security in the country has since been assigned to the PPF, which

is composed of the following services: the National Police, National Borders, National Aeronaval, and Institutional Protection Service. While the PPF possesses no major weapon systems and does not have a military command structure, it does possess considerably more armaments than the average national police force in Central America. In theory, the PPF is also supposed to be capable of carrying out limited military activities, though in practice its utility is severely limited by its size, limited armaments, and lack of institutionalization and advanced training.

The PPF maintains an active force of around 15,000 personnel and had a 2010 budget of \$336 million, of which about two thirds was for civilian policing, given the structure of the PPF. Security expenditures account for approximately 2% of Panama's gross domestic product. Its air force consists of one helicopter squadron (mostly Bell Hueys) and two squadrons of light aircraft, consisting of trainers, observation aircraft such as Cessnas, and Brazilian-made transports. The aircraft operate out of Tocumen International Airport and the former American Albrook Air Force Base near the canal. The naval arm is a small organization relegated to coastal protection, with a handful of harbor and patrol craft. Panama has two small swift-attack ships, the GC-201 *Comandante Torrijos* and GC-202 *Presidente Porras*, both built in the United States during the 1980s. The PPF has no armored vehicles or other major land weapon systems and only a handful of mortars.

Today, one of the biggest challenges to Panama's security is related to its proximity to drug trafficking routes to the United States, Canada, and Europe. The problem is exacerbated by the Panamanian government's weak counternarcotics enforcement, due to the lack of resources, weak border enforcement, and endemic corruption. Border clashes between the PPF and Revolutionary Armed Forces of Colombia rebels along the Colombian border have given rise to calls for more militarization of the border and reorganization of the PPF, which so far Panama has resisted. However, the new Panamanian president, Ricardo Martinelli, proposed in 2010 the creation of a new Ministry of Security, which would oversee the National Police, Air Service, Immigration Service, and National Borders Service, which he hoped would address the PPF's shortcomings.

PANAMA, U.S. INTERVENTION IN

Since its U.S.-assisted independence from Colombia in 1903, Panama has maintained an uneasy, sometimes tense relationship with the United States. The United States occupied the Panama Canal Zone, a 16-kilometer-wide swath that the 1903 treaty said the United States would control as "if it were the sovereign." The Canal Zone bisected Panama and existed as a slice of Americana in Central America, complete with an American high school, bowling alleys, and manicured lawns.

On one side, the Canal Zone provided many well-paying jobs to Panamanians, and the American presence ensured a much higher level of economic development in the Canal Zone region than in the rest of the country. But, regardless of this benefit, the omnipresence of American military forces in the country hurt some Panamanians' nationalistic consciousness and provided populist political leaders with ready rhetorical ammunition to stir nationalistic sentiments among the rural and urban poor as well as university students, who were always very politically attuned.

For the United States, the central importance of the Panama Canal in American foreign policy, especially during the Cold War, cannot be overstated. For most of the 20th century, the canal was the lynchpin in the U.S. Navy's two-ocean strategy, despite the canal's increasing vulnerability to modern missile technology and the fact that its relatively narrow width could not accommodate the passage

USS *Arizona* in lock, Panama Canal, 1921.

of modern aircraft carriers. Thus, the contrast of Panama trying to establish greater national sovereignty and the U.S. national security imperative of protection of the canal can be seen as the primary foundations that led to military conflict. However, a personal element was necessary to light the fuse. This entry discusses the buildup, events, and aftermath of the 1989 U.S. intervention in Panama.

Background

Since Panama's independence, there were periodic, minor confrontations between the United States and Panama over the sovereignty issue. But the level of rhetoric and rancor steadily increased following the 1968 military coup in Panama. The incoming military government was led by Major (later General) Omar Torrijos, a folksy but cunning professional

soldier whose enigmatic decision making and alliance building doggedly perplexed, confounded, and even frightened U.S. policymakers. While he could be bombastic, Torrijos was also broadly seen as a father figure by millions of Panamanians for the political, social, and economic reforms implemented during his rule. During this time, Torrijos successfully negotiated a number of treaties recognizing Panamanian sovereignty; the most important were the Torrijos-Carter Treaties of 1977, which called for the complete handover of the canal to Panama by the end of 1999. But the untimely death of Torrijos in 1981 gave way to the more brutal and caustic dictatorship of Manuel Noriega, who had been the head of the Panama intelligence agency, the G2.

Noriega was perceived by Washington officials as a loyal and dependable asset, especially since U.S. officials had viewed Torrijos as acting contradictory

to U.S. interests and Noriega had been a paid informant for the Central Intelligence Agency for almost two decades. As Panama's leader, Noriega allowed the United States to set up listening posts in Panama and to train the anti-Sandinista *contras* in western Panama near the border with Costa Rica. He also acted as an intermediary with Cuba's Fidel Castro. Noriega was, in fact, playing both sides of the fence for his own financial benefit. While purportedly helping the United States fight regional communism, Noriega expanded his business and intelligence contacts with the Sandinistas, the Cubans, and Colombia's Medellín Cartel.

Firmly ensconced in power by 1983, General Noriega (as he had become by then) turned to intransigence, bellicose ramblings, and infinitely more political meddling than his predecessor. Noriega additionally renamed Panama's National Guard the Panamanian Defense Forces (PDF) and tripled its size to about 15,000 soldiers. Using coercion through the PDF, in 1984 Noriega rigged the first free presidential election in 16 years for his hand-picked candidate, Nicolás Ardito Barletta. The outbreak of riots, strikes, and clashes between the PDF and protesters gave Noriega the excuse to try to eliminate some of his potential opposition and augment his power. The United States used its influence in the World Bank to cancel a \$50 million loan to Panama, quickly crippling its economy. In retaliation, the Panamanian government ordered all U.S. employees of the U.S. Agency for International Development out of the country. Since the U.S. dollar is Panama's currency, Panama began a slow but steady dive into a deep economic depression.

By 1988, U.S. forces in the Canal Zone were frequently engaging in firefights with PDF infiltrators, and a more desperate political environment developed, causing at least \$1 billion in foreign investment to fly out of the country. Panama's National Assembly demanded the expulsion of the U.S. ambassador and accused the United States of interventionist aggression. The last aggravation in the crisis was Noriega's indictment on federal drug charges in the United States. The PDF became more brazen in its harassment of the United States: Servicemen were illegally detained and sometimes physically assaulted, U.S. mail was stopped, and diplomatic dispatches were intercepted.

The heightened brutality, political repression, and degradation of democracy reached its zenith

during the 1989 presidential elections, which pitted the Noriega-sponsored candidate, Carlos Duque, against Guillermo Endara, who fronted a coalition of opposition parties. Though Endara handily won in a landslide, Noriega alleged "outside interference" in the election (a not-so-veiled reference to the United States) and nullified the results. A long-time associate of Noriega, Francisco Rodríguez, was named acting president, but the United States refused to recognize the new government. Encouraged by the United States, Moisés Giraldi, an officer in Noriega's inner circle, carried out a well-planned coup attempt against Noriega, which ultimately failed through lack of communication with U.S. forces.

On March 3, 1989, the PDF seized more than 20 U.S. school buses with children of U.S. military and civilian personnel aboard. U.S. military police intervened and defused the incident, but the provocation had a profound effect on the resident U.S. community in Panama, which sent a slew of messages to the U.S. Congress asking for action against the Noriega regime. During the summer of 1989, more than 50,000 U.S. military dependents living in Panama were ordered to return to the United States while a military buildup commenced in the Canal Zone. Full of bravado, Noriega declared that a "state of war existed" with the United States, and a U.S. Marine was murdered by the PDF the next day. The stage was set for a showdown with the United States.

The PDF had grown from a small paramilitary force of 5,500 in the late 1960s to a reasonably well-armed (including light infantry tanks and machine guns) and more professional military of around 15,000 by the mid-1980s, although only about 4,000 were combat ready. This relative growth of the PDF, however, paled in comparison with the force of almost 28,000 combat-ready troops the United States assembled in the Canal Zone, which included the 82nd Airborne Division, elements of the 5th Infantry Division, the 75th Ranger Regiment, and the XVIII Airborne Corps. In addition, more than 300 air assets were used.

Operation Just Cause

On December 17, 1989, President George H. W. Bush gave the order to execute the invasion, dubbed Operation Just Cause. The public justifications offered for the invasion were to safeguard Americans in the Canal Zone, fight drug trafficking, defend

democracy in Panama, and protect the Panama Canal treaties. On December 20, 1989, the United States invaded Panama in its largest military operation up to that time since the Vietnam War. The United States utilized overwhelming firepower that included the then brand new F-117A Nighthawk Stealth fighter, Apache helicopter gunships, AC-130 Spectre gunships, and bunker-busting 2,000-pound bombs. U.S. forces also enjoyed a great advantage in technology, such as night vision devices. Twenty-seven different sites along the Panama Canal, including Panama City and Colón, were attacked simultaneously. A primary target of the nighttime attack was the PDF headquarters, located in the densely populated, poor neighborhood of Panama City called El Chorillo. Systematically, entire city blocks of El Chorillo's wooden shantytown buildings were bombed or burned to the ground. In a largely symbolic attack, the Río Hato Military Academy was destroyed by

two of the 1-ton bombs. Panamanian military resistance essentially evaporated within the first 12 hours.

Noriega, however, was able to evade capture immediately by seeking refuge in the Papal Nunciature. The U.S. military encircled the papal embassy and blasted it night and day with loud rock music. Though advertised as a psychological operation to rattle Noriega, it was later revealed that the music's purpose was to prevent parabolic microphones from being used to hear the negotiations between U.S. general Marc Cisneros and the Nunciature's Monsignor Laboa. On January 3, 1990, Noriega emerged from the Nunciature in full dress uniform and surrendered to the U.S. forces. He was spirited out of the country to Miami for prosecution on the drug charges. Having been shielded in the Canal Zone by U.S. forces, president-elect Endara was sworn into office, and the PDF was disbanded.

Scorched rifles, machine guns, and rocket launchers lie in a heap after being removed from a Panamanian special forces armory that was destroyed during Operation Just Cause.

Source: Master Sergeant Ken Hammond.

Aftermath of the Invasion

At least 300 Panamanian soldiers and 60 U.S. servicemen died in the conflict, but it is difficult to assess exactly how many Panamanian civilians died. Official U.S. estimates say 250 were killed, while the Central American Human Rights Commission, the International Red Cross, and former U.S. attorney general Ramsey Clark put the figure closer to 3,000. Around 20,000 Panamanians were left homeless, and a postinvasion wave of vandalism is estimated to have inflicted more than \$2 billion in damages to property in and around Panama City.

The U.S. invasion of Panama is broadly seen as the first proof of the shifting geopolitical power since the beginning of the Soviet Union's disintegration. Previously, during the Cold War, such overt interventionist tactics were frequently shunned by the United States for fear of reciprocity by the former USSR elsewhere. But without the counterbalance of the former USSR, no such hesitancy was warranted. Moreover, the United States had largely resisted direct intervention in Latin America during the Cold War because of the perceived danger of tipping the balance in the delicate alliance creation diplomacy that characterized U.S.-Latin American relations during the period. For these reasons, this invasion marks the emergence of the post-Cold War unipolar world, in which U.S. power would be unchallenged for more than a decade to come. The invasion also reflected the evolution for U.S. policymakers of the perceived conditions for the use of U.S. military force in the post-Cold War period.

The aftermath of the invasion was mixed. It took until 1993 for Panama's economy to recover, and a 1994 amendment to Panama's constitution permanently abolished the country's military, leaving only a small police force in its place. Primarily, the contention that still exists regarding the invasion revolves around the lack of concrete evidence to support civilian casualty claims by the United States and the overwhelming use of supporting force in a predominately civilian area, in part attributed to the general lack of experience of the U.S. forces in supporting fire in urban environments. Nonetheless, the invasion cleared the way for the reestablishment of a long-standing democracy in Panama, which has been called by Freedom House one of the freest countries in the Western Hemisphere in terms of its civil liberties.

PAY, MILITARY

The current military pay system in the United States, which attempts to offer military personnel a level of financial compensation comparable to the wages they might reasonably command in the national labor market, is neither the historical norm nor even the most common system in the contemporary world. Although soldiers throughout history have typically received some sort of economic compensation for their service, states seeking military manpower are not bound solely by economic laws of supply and demand in the wages they offer. They enjoy enormous flexibility as the major—and typically the only—employer of military personnel, and they also have the option of bypassing the labor market completely, compelling military service through conscription (the draft). Moreover, individual decisions about whether to join the military are often motivated by nonfinancial considerations. As a result, both the manner in which soldiers have been paid and the relative generosity of that pay have varied widely by time and place. This entry examines military pay policies throughout history, military compensation in the U.S. all-volunteer force, and current issues.

Militia, Mercenary, and Mass Conscript Armies

Paid military establishments seem only to emerge with the rise of the state, and oftentimes not even

then. Members of the citizen armies of the early Greek city-states were organized along militia lines and served at their own expense, although only for relatively short campaigns. By contrast, in late-13th-century Italy, the *condottieri* and the members of their mercenary companies fought under contracts that spelled out, in painstaking detail, both their financial compensation and their corresponding military duties. Somewhere between these extremes lie the political and economic arrangements of feudal societies, the pay offered to members of the mass conscript armies of the modern era, and the pay systems of the professional all-volunteer forces of the contemporary United States and Great Britain.

States throughout history have frequently adjusted their recruitment policies to meet current military requirements, with concomitant effects on levels of military pay. Many armies, particularly during the ancient and medieval eras, included categories of soldiers recruited—and therefore paid—in different ways. English armies during the reign of Edward III of England could include noblemen fulfilling military obligations as feudal landholders, soldiers conscripted at county levies, indentured (paid) soldiers, and hired mercenaries. Also, recruitment and pay policies for a given army or country could change over time, sometimes during the same war or even during the same campaign. For example, although the military establishment of republican Rome was originally organized as an unpaid citizens' militia, Roman soldiers participating in the siege of Veii (406–396 BCE) were given monetary pay to enable them to continue the siege past the usual short campaign season, and professional pay for the Roman army was permanently introduced sometime before the 2nd century BCE.

For much of history, military salaries were not particularly generous. Pay for sailors in the Athenian navy during the Peloponnesian war was comparable to but somewhat lower than a workman's wage, as was pay for Roman soldiers in the 1st century CE and pay in the afore-mentioned medieval army of Edward III of England. Even pay for the professional *condottieri* and their followers was often set at a near-subsistence level, usually covering only the soldiers' living expenses, equipment, and horses. Regular military pay could, however, be supplemented in various ways. For example, victorious soldiers in ancient and medieval armies could profit from booty, plunder, and ransom payments; soldiers

in the Roman imperial armies were accustomed to receiving bonuses from their generals and from new emperors; and professional soldiers, particularly in large and wealthy states, could be given land grants or pensions at the end of their service.

Although states using conscription do not have to offer a generous salary to draftees, military living conditions and pay levels became a potent political issue with the emergence of the modern democratic nation-state. In the years after the French Revolution, for example, pay levels and overall living conditions in the French army improved dramatically from their prior levels under the *ancien regime*. Recruitment through conscription nevertheless allows states to pay less than a market wage for military manpower—a fact emphasized by proponents of an all-volunteer military, who argue that conscription amounts to an implicit tax on the earnings and labor of draftees.

Pay in the American All-Volunteer Force

After a lengthy period during which much of its national military manpower came from the draft, the United States adopted an all-volunteer force structure in 1973. With the American military in direct competition with civilian employers for manpower, military pay had to be competitive with civilian salaries in order to attract sufficient numbers of enlistees, and the level of cash pay for entry-level military personnel was increased drastically, more than doubling the pay prior to the transition. In the decades since, it has periodically proven necessary to increase pay in order to recruit and retain a high-quality force in the face of changing conditions in the civilian economy and the international situation. In the late 1970s, the volunteer force faced its first major challenge as pay levels failed to remain competitive with pay in the civilian sector. In the late 1990s, a booming civilian economy and increased operations tempo led to another manpower crisis. And in the mid-2000s, both the U.S. Army and—to a lesser extent—the Marine Corps faced recruiting challenges during the wars in Afghanistan and Iraq. In each case, bonuses and substantial increases in pay were used to solve the manpower crisis.

Currently, pay in the American armed forces is set at a level that allows the Department of Defense to recruit and retain a force of the size, quality, and composition that it judges necessary to meet the

most important military threats. This is done largely by adjusting the level of military compensation. However, not all adjustments are made by increasing cash pay and benefits, which are not easily decreased once they have been increased. Instead, policymakers use bonuses, special pays, and other incentive pays, which permit them to react to short-term manpower crises with short-term solutions rather than with permanent increases that could drain military and national budgets. These types of financial incentives also allow policymakers to target the particular categories of personnel that are needed, instead of spending resources on individuals who are already satisfied with their level of compensation.

Regular military compensation under the American system consists of three major categories: (1) *basic pay*, (2) an *allowance for housing*, and (3) an *allowance for subsistence*. Basic pay is allotted in accordance with each service member's pay grade and length of service. For enlisted ranks, basic pay starts at roughly \$1,400 per month for service members in Pay Grade E-1 (private, airman basic, or seaman recruit), increases to roughly \$2,400 per month for a typical service member in Grade E-5 (sergeant or petty officer second class), and ultimately rises to well over \$5,500 per month for service members in Grade E-9, the highest enlisted rank (sergeant major, chief master sergeant, or master chief petty officer). For officers, basic pay starts at roughly \$2,800 per month for Grade O-1 (second lieutenant or ensign), increases to roughly \$6,500 per month for Grade O-4 (major or lieutenant commander), and rises to roughly \$15,000 per month for Grade O-10 (four-star general or admiral).

Within each pay grade, service members with greater seniority receive additional basic pay based on their time in service. For example, a sergeant (E-5) with 8 years in service will receive \$2,845, compared with the \$2,487 a sergeant with 4 years of service will receive. Differences in pay can be especially pronounced among junior officers, a small percentage of whom come from the enlisted ranks. A second lieutenant (O-1) with 1 year of service may receive a basic pay of \$2,828 per month, compared with the \$3,940 received by a second lieutenant who has 8 years of service.

Allowances for housing and subsistence cover basic living expenses and are only paid to service members whose housing and meals are not provided by the government. (This generally excludes most of

the lowest ranking enlisted personnel, who live in barracks or on ship and eat their meals in mess halls.) While base pay is the same across the American military for all members of a given pay grade and number of years of service, allowances for housing and subsistence can vary considerably, since they are calculated in terms of the market cost of housing, the number of dependents the service person has, and other variables including rank. For example, service members living in San Diego, California—a relatively expensive location for housing—receive higher allowances for housing than those living in less expensive areas. Similarly, a service member with two dependents will receive higher allowances than a service member without dependents.

Military personnel in special situations or who possess special qualifications may receive special pays and allowances beyond these categories of regular military compensation. Individuals who are deployed at sea or in combat zones, who are separated from their families in the course of their duties, or who perform particularly hazardous duties receive special pays for these situations. Similarly, aircraft pilots and other crew members receive flight pay, airborne-qualified soldiers receive jump pay, and submarine personnel receive submarine pay, so long as they are actively using their qualifications. These special pays can be awarded simultaneously. For example, a paratrooper deployed to a combat zone may receive jump pay, hostile fire pay, and family separations pay in addition to his or her basic pay and allowances. The amount of these special pays can vary: Hostile fire pay, for example, is \$225 per month, while flight pay ranges between \$150 and \$250, depending on the service member's rank.

Finally, certain categories of military personnel receive higher levels of pay for their professional qualifications. For example, attorneys and medical professionals (doctors, dentists, and nurses) enter service at officer rank and are also eligible for special pays related to their legal and medical qualifications. Special operations personnel, many of whom are in the enlisted ranks, may benefit from accelerated promotions, special pays, and retention bonuses.

Bonuses for enlistment or reenlistment may vary from year to year, from service to service, from military occupation to military occupation, and from pay grade to pay grade, depending on the specific needs of the service. For example, in 2008, retention bonuses for U.S. Army infantry captains

were around \$35,000 for a 3-year contract extension, while in 2009, reenlistment bonuses for army infantry sergeants who were ranger and parachutist qualified ranged between \$11,000 and \$12,000 for a 3- to 4-year reenlistment. Individuals with special qualifications—doctors, nurses, attorneys, and special operations personnel—may be eligible for special retention bonuses as well. Bonuses can be phased out once the recruitment or retention targets are met, making them an especially attractive way for policymakers to equalize supply and demand in the labor market.

Current Issues in Military Pay

Although the U.S. all-volunteer force competes with civilian employers for recruits, its pay system continues to differ markedly from compensation practices in the civilian world. Many critics argue that the traditional military pay system fails to take advantage of efficiencies that are increasingly common in the civilian sector. They suggest that officer pay may be too low to retain midlevel officers whose skills and experience can command high salaries in the civilian labor market, while enlisted pay may be more generous than necessary to recruit and retain junior enlisted personnel, whose comparative lack of training and educational credentials are not at a premium in the civilian labor market. These critics also argue that the system of allowances for housing and subsistence creates economic incentives for military personnel to marry earlier and have more children than their civilian counterparts. Finally, these critics suggest that the inflexibility of the military pay system may also contribute to difficulties with recruiting specialized workers, like information technology workers and special operations personnel, whose skills can command a wage premium in the national and international labor markets.

These criticisms have led to periodic proposals to overhaul the military compensation system. It is not clear, however, that all of the military's personnel problems can be solved simply by creating a system that mirrors the compensation practices of the civilian world. Many of the differences between civilian and military compensation systems can be traced to the special circumstances of military service: for example, the military's traditional insistence on a close connection between pay grade and military rank, service members' expectations of a broad

level of pay equity within the services and within pay grades, and the logistical necessity of providing noncash benefits like housing and medical care. Although the U.S. military and other militaries around the world are working to transform themselves and their personnel policies, wholesale adoption of civilian compensation policies seems unlikely, at least in the foreseeable future.

PEACE MOVEMENTS

Peace activism and peace movements have played a vital role in the nation's history. The problem is that their contributions to social reform have barely been chronicled in history texts. Yet the American peace movement has occupied a major part of our reform tradition. People have been drawn to peace activism for a variety of reasons. There are those who subscribe to various pacifist ethics, religious or otherwise, or the belief that peace is based on continuing human relationships. Many—not pacifists—have limited their commitment to specific antiwar actions, opposing U.S. involvement in various wars

for a number of reasons. A large number have supported the crusade for internationalism, urging the creation of world bodies designed to mediate disputes among nations. Finally, there are those who support the doctrine of antimilitarism, arguing that large, standing armies threaten constitutional democracy and individual liberties. Whatever the reasons, peace activism and organized movements to end warfare have been a part of the American past. This entry examines the history of peace movements in the United States and discusses the antiwar groups and individuals active today.

The Early Years

From the early years of settlement in the New World to the American Revolution, religious sectarians established a social commitment to the importance of organized peace. The most notable of the pacifist/reform sects was the Religious Society of Friends, or Quakers. Their influence on the early American peace movement during the late 17th century and throughout the 18th century was significant in terms of promoting the doctrine of passive nonresistance, more popularly known as conscientious objection. The Quakers, along with the Mennonites and the Church of the Brethren, formed the core of the Historic Peace Churches. These sectarian peace groups continue to promote nonviolence and refuse to take up arms as part of their religious beliefs. While not politically active today, they still remain vital to the American peace tradition.

The first modern organized efforts to eliminate war from society began in the United States at the conclusion of the War of 1812. This movement, while bolstered by the spreading spirit of evangelical Christianity and romantic faith in human perfectibility, was nonsectarian. In 1828, the American Peace Society was created to publicize the benefits of peace. It was one of the first national peace organizations in history and represented the views of the various local peace societies that sprang up after the War of 1812. The membership of this group and the local branches was composed primarily of preachers, lawyers, merchants, women, and public servants. During the pre-Civil War period, supporters of world peace established periodicals and published tracts designed to convince humankind that war was un-Christian, wasteful of life and treasure, and ineffective as a method of solving disputes between nations.

After the Civil War, in response to industrialization, the movement for world peace moved away from socially concerned pacifism and nonresistance and became a more cosmopolitan endeavor dominated by an elite cadre of lawyers, business leaders, and politicians. This group valued arbitration, Anglo-American cooperation, and an industrial world of Great Power interdependence. More than 130 new international, nongovernmental organizations, such as the International Arbitration League (1880) and the National Arbitration League (1882), were created in the last quarter of the 19th century. This new movement gave birth to the term *international organization*.

The 20th Century

Prior to the First World War, the movement to abolish war was considered a prestigious calling. It was devoted to the legal settlement of disputes, the maintenance of government contacts, the development of an “international mind,” and the encouragement of the “scientific” study of war and its alternatives. Between 1901 and 1914, 45 new peace organizations appeared, including the American Society of International Law, the World Peace Foundation, and the Carnegie Endowment for International Peace. These groups had a distinctly elitist approach to solving international problems. Proponents of world peace assumed that the literate men of the upper and professional classes would better understand and identify with the “civilized” quality of their movement than the “unenlightened” industrialized masses. Many internationalists were prominent citizens and highly patriotic. Yet in spite of all this intellectual and economic firepower, the movement failed to prevent the greatest war in history up to that time.

The Great War (World War I) led to the modern American peace movement, a movement insisting that peace required social reform as well as social order. Antiwar dissidents included radical groups and socialists who viewed the war as a capitalist conspiracy—one that would lead to further repression of the working classes and other dispossessed peoples. It now became fashionable for government officials to label antiwar protesters as “unpatriotic,” even though they were interested in making America a better place to live. Inspired by organizations such as the Women’s International League for Peace and

Universal Military Training: A Debate. World War I pamphlet cover of the American Union Against Militarism.

Freedom, War Resisters League, and the religious Fellowship of Reconciliation (FOR), the new movement understood justice as the amelioration of social wrongs and not simply the adjudication of courts. It rejected Anglo-Saxon exclusivity and supported cultural diversity. War was seen as a by-product of militarism, nationalism, and imperialism, not merely as an irrational outburst of mass ignorance. The new peace activists sought a reformed and democratized international system by which responsible policymakers would manage peace through world agencies by promoting social justice. Peace became something more than the absence of war. The "modern" American peace movement and its various manifestations characterized antiwar activists until the mid-1950s, when a new coalition of pacifists

and internationalists turned their attention to the threats posed by nuclear destruction.

During World War I, the formation of the American Friends Service Committee (AFSC) signified a dimension to peace work other than opposing militarism and conflict: war relief. The committee sent many young men and women to France, where they worked in cooperation with British Friends to feed and care for refugees, build a maternity hospital, and repair and rebuild destroyed homes and schools. Reconstruction and medical care represented a major part of the committee's relief efforts in both France and Belgium. Once the war ended, the AFSC extended its work to Russia, where relief workers helped fight famine and disease; to Serbia and Poland, where they assisted in agricultural development and constructed orphanages; and, finally, into Austria and Germany, where they fed hungry children. Its efforts established a new trend among peace activists to translate their words into deeds and overcome the stereotypical label of "obstructionists." From that point forward, the newly established post-World War I peace organizations would devote money and volunteers to the area of war relief.

The policy of war relief continued during the Spanish Civil War, when the AFSC and FOR sent food and medical supplies to the victims of the fascist aerial bombings. This policy remained in effect during the Second World War. Peace groups provided more than \$300,000 in assistance to war-torn areas in Poland, France, India, China, and England while also sending relief workers and supplies to France and China. The AFSC operated the Friends Ambulance Unit in China, aided in relief work in India, and cared for war victims in France. The FOR headed up a War Victims Fund during the war, with aid going to individuals and organizations such as the school and community at Le Chambon, France, and to homes for children from concentration camps in Czechoslovakia. Pressured by the Women's International League for Peace and Freedom, moreover, President Franklin D. Roosevelt accepted a plan to expand the number of refugees admitted to the country by establishing the War Refugee Board.

The early Cold War years stunted the effectiveness of the peace movement due to national security concerns and the rise of a garrison-state mentality in America. While war relief and pacifism were the

benchmarks of the traditional peace groups, a more direct-action movement surfaced with the Vietnam War (groups such as the AFSC and FOR still sent numerous supplies and aid to Vietnamese peasants whose farms and lands were destroyed by aerial attacks and chemical defoliation). The most visible and widespread antiwar demonstrations in American history took place during the Vietnam War. Acts of civil disobedience and direct action highlighted the antiwar dissent. The war in Vietnam produced a wide variety of resistance activities—including teach-ins on college campuses; the largest peace march in American history, held in Washington on October 15, 1969, involving nearly 2 million people and known as “The Moratorium”; and a mass, nonviolent attempt to shut down the machinery of government in Washington in May 1971. The demonstrations of this era were no longer limited to handfuls of peace

workers but grew from hundreds to thousands and then to tens of thousands of people. The shockwave of opposition covered the political spectrum, from respectable conservative leaders to New Left radicals to the returning veterans, who formed the Vietnam Veterans Against the War.

In the 1980s, the American peace movement not only called for a “freeze” on the development and deployment of nuclear weapons but also began publicizing crimes against humanity—first orchestrated at the Nuremberg Trials in 1945–1946. When former U.S. Marine platoon leader and seriously wounded Vietnam veteran Bobby Muller traveled to Cambodia in 1984, he was shocked to witness the chilling effects of genocide. He was also moved by the tragic reality that many land mines, which remained after the Vietnam War, had killed innocent civilians. With his own group Veterans for America,

he cofounded the International Campaign to Ban Landmines, which received the Nobel Peace Prize in 1997. Continuing to promote world peace and to assist innocent civilian victims in war-ravaged countries, Muller promoted other programs like Information Management and Mine Action Programs. His efforts alerted other peace organizations to focus their attention on ending acts of genocide and encouraging governments to locate and dismantle land mines wherever they existed.

Persian Gulf War

The peace movement's focus on nuclear arms reduction and the indiscriminate use of land mines during the decade of the 1980s gradually shifted to anti-war activism at the start of the 1990s. In response to Iraq's invasion of Kuwait, President George H. W. Bush prepared for a Mideast war. Prior to the commencement of Operation Desert Storm, an antiwar movement was organized. On October 20, 1990, some 15,000 protestors marched in New York and 15 other cities across the country. Between October 1990 and January 1991, when the war began, there were various forms of protest. In San Francisco, a

TV station was interrupted during its broadcast, and the Golden Gate Bridge was blockaded on several occasions. In New York City, groups of protestors, organized by the War Resisters League, marched outside the stock exchange on Wall Street to condemn a possible war fought in the name of oil. Other protestors also gathered outside the United Nations carrying signs urging the Security Council to disapprove a U.S.-sponsored resolution calling for military force.

The FOR, moreover, sent delegations of religious leaders and peace activists to Iraq to try to prevent the war. One peace mission delivered 1,000 pounds of vitamins and antibiotics to evacuees in Jordan and Americans in Iraq and successfully obtained the release of four American citizens held in Baghdad.

When the war started on January 16, 1991, more than 3,000 Bostonians immediately turned out to protest against it. On January 26, a week after

15,000 turned out in force for a demonstration in Washington, D.C., a much larger crowd returned; estimates ranged from 70,000 to as high as 250,000. After only 100 hours of fighting on the ground, however, Iraq accepted an UN-imposed cease-fire. The quick end to the war and the patriotic sentiment expressed over the airwaves mitigated the antiwar protests.

Although estimates vary, Iraqi casualties numbered about 25,000 dead. Some 140,000 U.S. service personnel were exposed to low levels of sarin, and by 2002, more than half had sought medical care or some type of disability assistance. The Iraqi people were subsequently forced to battle typhoid, cholera, and imposed UN sanctions—military and economic—resulting in many more deaths and depravation. In fact, the imposed sanctions from 1990 to the start of the 2003 Iraq War resulted in the death of thousands of Iraqi children. Peace groups in America, such as Voices in the Wilderness and the FOR, provided tons of medical supplies and basic necessities to Iraqi civilians in defiance of U.S. law and despite heavy fines and threatened imprisonment.

Iraq War

Although the peace movement did not condone American military action in Afghanistan despite September 11, 2001, the war in Iraq captured its full attention. While the nation strongly endorsed military action against the Taliban and al Qaeda in Afghanistan, many questioned the legitimacy of the claims raised by the George W. Bush administration that Saddam Hussein's regime in Iraq had weapons of mass destruction. As Bush laid out his justification for going to war in the fall of 2002, peace groups quickly mobilized. On October 3, 2002, an antiwar group, Americans Against War With Iraq, ran a full-page ad in the *New York Times* with blaring headlines, "Bush's Weapons of Mass Distraction: War With Iraq." Surrounding the ad were hundreds and hundreds of names endorsing it as well as encouraging Americans to call on their senators and congressional representatives to vote against an invasion of Iraq. Three days later, thousands rallied at Central Park's East Meadow in New York City. Speaker after speaker denounced the impending invasion. The newly formed antiwar group, Not in Our Name, organized the rally. On October 26, 2002, a

massive antiwar rally, with the antiwar International ANSWER acting as the clearinghouse, was held in Washington, D.C. In December, 99 people were arrested in front of the U.S. mission to the United Nations for protesting the impending war in Iraq; they were arrested for disturbing the peace. Among those arrested were Daniel Ellsberg, author of the Pentagon Papers, and Ben Cohen, cofounder of Ben and Jerry's Ice Cream.

One of the salient aspects of this antiwar movement has been the sheer size of protests and its global scale. The antiwar coalitions were composed of people from all walks of life. There were the elderly, former veterans young and old, college students, and people from all races. Opposition to this war cut across all race and gender lines. Rich and poor also came out to protest the war. Most noticeable, perhaps, were women and men who were in their 70s and 80s. One unique aspect of the anti-Iraq War protests was the focus on saving soldiers' lives. Activists worked hard to avoid the charge of being "unpatriotic" that veterans groups attached to antiwar protest during Vietnam.

As the number of American soldiers killed in action mounted (the number is presently well over 7,000 for Iraq and Afghanistan, with the number as of September 1, 2012, in Afghanistan at 2,109), the American Friends Service Committee initiated its own novel protest. Called "False Pretenses" or "Eyes Wide Open Exhibit," AFSC first introduced the idea of a memorial by placing 500 pairs of boots at the Federal Building Plaza in Chicago to symbolize graphically the number of soldiers killed at that point in the war. Other antiwar activists built mock coffins and stretched out on busy roads.

One antiwar group that did capture the national media's attention is Grandmothers Against the War. This organization is primarily a local, responsive coalition in New York. In late 2005, 17 grandmothers, ranging in age from 49 to 90 years, were arrested. On October 17th, these aging but fiercely determined activists attempted to enlist in the military at New York City's Times Square recruiting station. When they were refused entry into the station, they then sat down and were promptly arrested. At their arraignment, one of the protestors, 65-year-old Eva-Lee Baird, called her arrest "a badge of honor." Their actions inspired other elderly women to take up the cause in cities such as Chicago, San Francisco, and Los Angeles.

Perhaps no one individual did as much to call attention to the antiwar cause as Gold Star Mother Cindy Sheehan from California. Her personal campaign began in 2004, after her son, Army Specialist Casey Sheehan, was killed in Iraq. She first attracted worldwide attention when, in August 2005, she conducted a 26-day vigil outside President Bush's Texas ranch at Crawford. In September, she was arrested while protesting outside the White House. She was among several hundred demonstrators who marched around the White House and then sat down on the pedestrian walkway on Pennsylvania Avenue. As the police came to arrest the demonstrators, all were singing and chanting, "Stop the war now." Her most dramatic act of civil disobedience occurred in 2006 at the State of the Union Address. Sheehan was removed from the chambers wearing a T-shirt that read "2245 Dead. How many more?"

Numerous peace groups, including CODEPINK for Peace, World Can't Wait, ANSWER, Veterans for Peace, Peace Action (formerly the Committee

for a SANE Nuclear Policy), Historians Against the War, and Not in Our Name, have undertaken traditional and not so traditional forms of protests. These have included staging a war crimes tribunal in New York City to look into the alleged abuses, independent filmmaking such as Michael Moore's controversial movie *Fahrenheit 9/11*, bringing Iraqi women to the United States to describe the horrors of the war, guerrilla theater, opposing military recruiters on campus, mass letter writing to members of Congress as well as to news and media outlets, extensive use of blogging, and protest music, such as the Dixie Chicks and Raging Grannies.

One of the unique aspects of the current peace movement, moreover, has been its online organizing, which has helped many antiwar groups succeed in their efforts to mobilize at the grassroots. One antiwar organization relying heavily on Internet usage is Americans Against Escalation in Iraq. Americans Against Escalation in Iraq is a broad-based coalition of activists, policy outfits, and labor unions that

were brought together in 2007 by MoveOn.org, the 3.4-million-member liberal advocacy group. Using conference calls and e-mail messages to Congress, this organization represents the new wave in protest movements—one aimed at influencing votes in Congress rather than organizing street theater and mass demonstrations. The web-based antiwar network WHY WAR? has provided news and analysis, along with strategies for political activists. Another popular group, United for Peace and Justice, encourages campus activism by offering updates as to what other student activists are doing around the nation, as does ANSWER (aimed at organizing the masses for protest marches), Peaceful Tomorrows (founded by family members of 9/11 victims to encourage non-violent solutions to terrorism), and Win Without War (designed to increase global awareness to prevent future wars). There are also online sites encouraging veterans to participate in a campaign to bring the soldiers home, such as Veterans for Common Sense, Operation Truth, and Iraq Veterans Against the War.

One of the most perplexing problems associated with the Iraq War's unpopularity has been the issue of torture. The revelations at Abu Ghraib in Iraq and Camp X-Ray at Guantanamo Bay, Cuba, were troubling to peace and human rights activists. The American public was stunned to learn of the ill-treatment of prisoners at both the detention camps. In addition, many of the captured enemy combatants have been classified as prisoners of war and have not been afforded legal counsel as required by the Geneva Conventions.

By 2008, peace demonstrations had diminished in number and size. In part, the American public had become tired of this prolonged conflict, and the demand that American troops leave Iraq was pronounced in the presidential election that year. In June 2009, all American combat forces were required to withdraw from Iraqi cities, thus turning over security measures to the Iraqi government and its army. This represented the first clear drawdown of American military presence since the troop surge of late 2007 and 2008. During the 2008 presidential election, Barack Obama promised an end to the Iraq War by the year 2011. Obama's election thus signaled the rejection by the American people of his predecessor's military policies in Iraq. All American troops did depart from Iraq in December 2011. With the departure of all American combat troops, however, it was agreed that a small number of U.S. service members remain in a noncombatant role

to assist and train Iraqi police and security forces. That role has since been turned over entirely to the Iraqi government, and the only remaining American presence is in the form of economic assistance and reconstruction.

The costs of the war in Iraq and the damage inflicted on the Iraqi people were staggering. The cost of the war was estimated by many fiscal experts to be well over \$500 billion and is still rising. The hidden total cost of the wars in Iraq and Afghanistan (oil market disruptions, forgone investments, long-term health care for veterans, and interest payments on borrowed funding for the wars) is expected to balloon to \$3.5 trillion in the decade after 2010.

Furthermore, despite attempts by the American government to reconstruct Iraqi society, the loss of lives and the attendant poverty have led many peace groups to raise money to purchase necessities for many of the displaced Iraqi refugees living in nearby countries, such as Jordan and Syria. A recent estimate put the death toll of Iraqis at more than 110,000. Since the start of the war, the AFSC and the FOR have been sending in food, medicine, and basic survival supplies to the Iraqis. Peace groups have also assisted the War Kids Relief Program, started in 2005 by Captain Jonathan Powers, who served with the Army's 1st Armored Division, as a way to help Iraqi children deal with the devastating effects of the war. War relief has now become one of the peace movement's primary objectives in dealing with the Iraq situation.

Conclusion

The American peace movement that emerged after 9/11 reflects the interconnectedness associated with globalization and new communication technologies. While military theorists state that the future of warfare will revolve around social and communication networks worldwide, antiwar and peace groups are echoing the very same theme and using them to get out the message of peace and justice. Although the Iraq War has finally ended, the battle against the Taliban and al Qaeda in Afghanistan continues gaining the attention of peace groups, although in a less dramatic way—very few antiwar protests or peace marches—since the deadline announced by President Obama for American withdrawal. Presently, one of the more controversial issues is the continuing use of deadly drone attacks against suspected al Qaeda and Taliban leaders in the region. Press reports

indicate that, in the past 3 years, 14 terrorist leaders have been killed by drone strikes, while Pakistani sources estimate that some 700 civilians were killed. This amounts to more than 50 civilians killed for every militant killed, excluding specifically targeted Taliban and al Qaeda leaders. Nonetheless, the number of terrorist leaders killed in 2012, for instance, was nearly doubled through further drone strikes, thus increasing the tension between neighboring Pakistan and the U.S. government. Only time will tell, however, whether or not the peace movement will be able to generate the support it had garnered in its condemnation of the Iraq invasion. Given the targeted year of 2014 for a complete pull-out of U.S. forces, it appears that peace organizations around the globe and in the United States are focusing their efforts on economic reconstruction.

Since the time of colonization to the end of the first decade of the 21st century, sectarian and non-sectarian peace groups have played a vital role in American history. The development of an organized peace movement in world history actually began in the United States in the early part of the 19th century. It continues to be one of the most important social reform endeavors. Moreover, with respect to peace movements, globally, it is safe to say that their importance has grown in size and stature given the realities of modern warfare and nuclear annihilation. The American peace movement is now part of the larger global peace community due to the Internet. While the American peace movement, historically, may not have been effective in preventing past and current wars, it has been responsible for informing the public as to the destructiveness of modern warfare and its effects on the lives of innocent civilians.

PEACEKEEPING

Peacekeeping is mostly associated with the United Nations and traditionally took the form of military forces from neutral countries deployed to supervise a cease-fire between adversaries. Initial UN peacekeeping operations during the Cold War era generally involved a relatively small number of lightly armed troops patrolling a neutral zone separating opposing forces. Impartiality remained the hallmark of these operations, which stressed supervising a political agreement or truce negotiated between warring nations. Troops participating in UN operations served in national contingents under the flag of the United Nations and traditionally donned blue helmets to identify themselves as peacekeepers.

With the end of the Cold War, peacekeeping operations expanded in size and scope, increasingly morphing into peacemaking operations.

Instead of supervising a truce or political settlement, peacemaking operations entailed intervention in a failed state to bring stability, provide humanitarian relief, and, in a number of cases, supervise elections to establish a new government. In the 1990s, these operations grew in size, complexity, and cost. Their record included modest success in places like Cambodia and Namibia, and to a degree in Haiti, and clear failures, especially in Somalia, the former Yugoslavia, and Rwanda.

Since its founding in 1945, the United Nations has overseen a total of 67 peacekeeping operations. In 2012, the organization carried out 16 operations costing \$7.2 billion and involving 81,339 troops, 2,006 military observers, 13,552 civilian police, and 5,404 international civil servants. Some current operations are quite small, such as the United Nations Truce Supervision Organization, which was established in 1948 and consists of 149 military observers and a support staff of international civil servants and local civilians totaling 236. One of the largest operations, the United Nations Organization Stabilization Mission in the Democratic Republic of the Congo, includes 16,996 troops, 721 military observers, 1,392 police, and 965 international civil servants. This operation alone has cost more than \$1.4 billion. In fiscal year 2012–2013, approximately \$7.23 billion was budgeted for UN peacekeeping operations. In fiscal year 2011–2012, the United States underwrote 27% of the cost of these operations, with Japan providing 12%, the United Kingdom 8%, Germany 8%, and France 7%, and the remaining cost apportioned to other member nations.

During the Cold War, the United States and the Soviet Union generally embraced a minor role in most peacekeeping operations. UN commanders tended to be drawn from nations that were not permanent members of the UN Security Council. Nations that contributed forces tended to be non-aligned countries, such as Austria, India, and Ireland, or to have a strong commitment to the United Nations, such as Canada and the Nordic countries. With the end of the Cold War, American involvement in peacekeeping operations initially increased but soon diminished after the failed intervention in Somalia in 1993. As UN operations expanded, the participation of troops from foreign nations dramatically increased, with countries including Pakistan, Bangladesh, India, Ethiopia, and Nigeria contributing most of the UN personnel.

Although most peacekeeping and peacemaking operations are conducted by the United Nations, other multilateral organizations have sponsored them, including the North Atlantic Treaty Organization (NATO) and the African Union. Some nations have also responded unilaterally; for instance, in 2007, the British sent ground forces to Sierra Leone to bring stability after a lengthy civil war.

Origins of Peacekeeping/Peacemaking

In 1942, President Franklin D. Roosevelt proclaimed the alliance fighting against the Axis Powers of Germany, Italy, and Japan as the United Nations. The Charter for the United Nations Organization, drafted and ratified in 1945, envisioned the organization promoting collective security, through military force if necessary. Organizationally, the Charter established a military staff committee consisting of the chiefs of staffs of the armed services of the five permanent members of the Security Council to advise the Security Council on military matters. This body quickly became dormant and never played a significant role in advising or planning UN peacekeeping operations.

Early in the organization's history, the United Nations deployed military personnel lent by member nations to supervise truces in the Middle East between Israel and her neighboring countries (United Nations Truce Supervision Organization, 1948) and in the Kashmir region between India and Pakistan (United Nations Military Observer Group in India and Pakistan, 1949). In 1950, the Security Council invoked collective security guarantees to urge member states to come to the aid of South Korea in repelling the North Korean invasion. The United States provided the bulk of the troops for what President Harry S. Truman deemed a police action, with other nations including Canada, Great Britain, France, Turkey, Australia, and New Zealand also contributing contingents.

The first modern peacekeeping operation took place in response to the Suez Crisis of 1956, when Great Britain, France, and Israel seized control of the Suez Canal. Under pressure from both the United States and the Soviet Union, all three countries agreed to return the Canal to Egypt. As part of the settlement, the United Nations deployed an international military force to the region to supervise the withdrawal of the British and French forces and to

serve as a buffer between Egypt and Israel. These UN forces were withdrawn in 1967 on Egypt's request; shortly thereafter, war broke out between Israel, Egypt, Jordan, and Syria (the Six Day War).

The Cold War polarized the Security Council; any action required the agreement of the Soviet Union and the United States since both nations possessed the veto. In the early years of UN history, the Soviet Union made frequent use of its veto. In the 1970s, the U.S. use of the veto increased, often to protect Israeli interests. As a result, UN peacekeeping missions generally reflected either agreement between the Soviet Union and the United States or instances where neither great power had significant national interests. In 1964, one of the longest UN operations was authorized to separate rival Turkish and Greek communities on the island of Cyprus.

The deployment of a UN force to southern Lebanon in 1978 would prove to be one of the most difficult operations of the Cold War era. The force deployed to this region supervised a fragile cease-fire that frequently broke down. For instance, the presence of the United Nations Interim Force in Lebanon (UNIFIL) did not prevent small-scale attacks by the Palestine Liberation Organization against Israel, and in several instances, UNIFIL troops came under attack. In 1982, Israel invaded Lebanon, and the UNIFIL troops were powerless to stop this incursion.

Peacekeeping and the Growing Mandate for Peacemaking

The end of the Cold War expanded the UN role in matters of peace and security. When Saddam Hussein invaded Kuwait in 1990, President George H. W. Bush decided to seek Security Council authorization for a military operation to liberate the country. As a result of skilled negotiation by the U.S. secretary of state James A. Baker, the UN Security Council adopted resolutions calling for military force to be used against Saddam Hussein unless he ended his aggression. The Bush administration not only gained Security Council support for an operation dominated by American and Saudi Arabian forces but also assembled a large and diverse international coalition.

The end of the Cold War proved immensely destabilizing in several world regions, most notably Yugoslavia and the Horn of Africa. A number of nations, including the United States, initially saw UN

action as key to reestablishing stability. In Somalia, the results would be disastrous not only for the Somali people but also for the future of UN peacekeeping/peacemaking measures. Initially, the UN intervention was humanitarian, with the deployment of relief workers to alleviate starvation caused by the ongoing civil war and to supervise a fragile cease-fire. In December 1992, President George H. W. Bush deployed a substantial American force to aid the UN humanitarian relief efforts and to bring stability. This task proved complex, exemplified when a raid designed to capture a major Somali warlord cost the lives of several American servicemen. In 1993, President Bill Clinton withdrew from Somalia. The ending of American support contributed to the collapse of the entire UN effort in Somalia, and the nation descended into chaos.

Somalia had a profound impact on America's support for UN interventions and peacekeeping operations. In the wake of the Somalia intervention, the United States exercised caution in making commitments to UN operations that sought to provide peace and security in failed states. The Clinton administration would not commit ground troops to UN operations in Yugoslavia despite Canada, Great Britain, the Netherlands, and France committing substantial forces, even refusing to intervene in 1994 when there was clear evidence of genocide. Although the United States intervened decisively in 1995 and in 1998, those actions only encompassed the use of U.S. air power under a NATO operation. When the United States did send ground forces to Kosovo in 1999, it did so as part of a larger NATO force.

Support for the United Nations waned among U.S. conservatives after President George H. W. Bush left office. Congressional critics suspended American aid to the United Nations for several years, arguing that the institution squandered funds and worked against American national interests. Widespread criticism existed regarding the practicality or wisdom of supporting nation-building efforts by international organizations. Congressional criticism was not without merit, and even supporters of the United Nations argued that its bureaucracy was bloated and often failed to properly manage UN peacekeeping operations, leading to wasteful spending, failure to provide logistical support to personnel on the ground, and even corruption.

UN operations floundered during this era because of lack of support from the United States and other

major powers, as well as the failures of the secretary general and the UN bureaucracy. In the case of Yugoslavia, UN peacekeepers were placed in the midst of war to enforce nonexistent cease-fires. Although the peacekeepers provided humanitarian assistance to civilians, their presence proved inadequate to provide security. At one point in the conflict, the United Nations tried to create a safe haven for civilians in Kosovo threatened by Serbian forces. UN peacekeepers, however, allowed defenseless individuals under their protection to be taken into custody and murdered at Srebrenica without putting up resistance. In the case of the UN operations in Rwanda, peacekeeping forces proved woefully inadequate, failing to stabilize a delicate political situation and even less prepared to cope with a systematically organized genocide. Despite pleas from the UN commander on the ground for reinforcements, the UN headquarters and the Security Council failed to mount a vigorous intervention until it was too late.

Should the United States or any nation support operations that do not appear to directly bolster their interests? Critics within the United States argue that America should avoid intervening in parts of the world simply for humanitarian reasons or to bolster collective security under the UN Charter. At the same time, allowing failed states to fester clearly incurs a cost for the world community. The failure to stabilize Somalia resulted in that nation becoming a safe haven for pirates, disrupting international commerce on the high seas and costing billions in higher insurance rates, ransom payments, and the deployment of naval forces by a number of nations to the region. Failed states, such as Afghanistan in the 1990s, offered a haven for al Qaeda and other terrorist organizations. In the case of Haiti, UN efforts to stabilize the country potentially benefited the United States by diminishing the number of Haitians fleeing the nation to escape political oppression or impoverishment. In 1994, President Clinton intervened in Haiti and supported a UN peacekeeping operation, partly to stop the flood of refugees seeking asylum in the United States.

UN Operations: Structure and Continuing Relevance

Most UN military operations are authorized by the UN Security Council and require the assent of a majority of that body, including the support of the

five permanent members. In the case of several such operations, such as the Korean and Persian Gulf Wars, member nations were empowered to take necessary military action with no attempt at direct oversight by the UN secretary general. The bulk of peacekeeping operations, however, mandate the creation of an international force with member nations providing troops and contributions.

The United Nations does not possess military forces of its own and depends on member nations to provide forces and underwrite their cost through special assessments. Coordination usually comes under the authority of the secretary general, with the Department of Peacekeeping assuming responsibility for implementation and the Department of Field Support providing logistical support. UN operations include both ground troops and a strong civilian staff presence, especially in operations that require administering elections or rebuilding a failed state. Many operations also include the formation of an international police presence.

Command and control of UN operations has been difficult. The secretary general's powers over peacekeeping operations are *not* comparable to those of the commander in chief of a sovereign nation. The secretary general has no standing military force that can be immediately deployed and no discretion to unilaterally send UN forces to intervene in a conflict. There exists no uniformed military command structure at the United Nations. The lack of adequate military expertise in planning operations represents a long-standing criticism of the organization. Some have suggested attempting to have the military staff committee established under the UN Charter actually carry out this role with regard to peacekeeping/peacemaking operations. Every peacekeeping operation must be created from scratch, and even under the best circumstances, it can take weeks, even months, to secure the necessary troops and funding for them. Countries contributing troops to UN operations have been reluctant to put their forces in harm's way under international command. UN commanders have generally been cautious about how they deploy troops in peacemaking operations, for fear that supporting nations will pull out their units. Moreover, the missions given to UN peacekeepers, UN police, and their civilian support staff are incredibly complex, often calling for disarming rebels, maintaining law and order, ensuring that government services are provided, and supervising free elections.

As they have expanded, UN operations have also resulted in increasing interaction with civilians. Charged with protecting innocent civilians, in several instances UN peacekeepers have engaged in systematic rape and sexual exploitation of civilian populations, most notably in the Congo. To address this issue, the United Nations has sought to increase the number of female soldiers and police officers participating in these peacekeeping operations.

Given the failures of the 1990s, optimism regarding the creation of a new world order has faded. At the same time, there is a realization within much of the international community that UN peacekeeping and peacemaking operations are essential to maintaining international stability. Although their size and cost have expanded dramatically, costs are still modest in comparison with global military spending. The 7.8 billion dollars spent on UN operations constitutes only 0.5% of global military spending, which stood at 1.6 trillion dollars in 2010.

PENTOMIC ERA

The Pentomic Era is the period in U.S. military history between the Korean and Vietnam Wars known for widespread integration of tactical nuclear

weapons into all four branches of the armed forces. The name is derived from the U.S. Army's five-battle-group division created for the atomic battlefield. This entry examines the origin and development of tactical nuclear weapons in the U.S. arsenal and discusses the structure and criticisms of the Pentomic division.

Ideas for using atomic weapons in a tactical role can be traced back to World War II and the idea of employing the atomic bomb in support of a projected invasion of Japan. The strategic use of the bomb and the ending of the war halted these plans. However, the concept of using nuclear weapons on the battlefield remained, even if nuclear war planning reflected U.S. Air Force strategic bombing.

As strategic weapons grew in yield, weapons of smaller yield coupled with warhead miniaturization enabled planners to imagine a variety of tactical roles. Before the Korean War, the U.S. Army began development of atomic artillery projectiles, as all branches sought various nuclear-capable platforms for tactical purposes.

The Korean War stimulated further thinking when the 1951 joint service "Vista Project" study recommended fielding tactical nuclear weapons in support of ground forces. Concurrently, the Department of Defense began studying the tactical use of atomic weapons at the "Desert Rock" exercises at the Nevada Test Site. In 1952, the North Atlantic Treaty Organization began readying options for tactical nuclear weapons. Planning for a resumption of the UN offensive in Korea in 1953 also included possible nuclear support.

Soon after the Korean Armistice, the Eisenhower administration sped up integration of nuclear weapons at the tactical level as a result of a "New Look" defense policy aimed at curtailing defense spending primarily from manpower reduction. Resulting in a dispute between the army and air force over strategic vision, the air force, reflecting the Eisenhower administration's policy of nuclear deterrence by threat of massive retaliation, saw future general war as a "strategic" bombing campaign of large-yield nuclear weapons. Should deterrence fail, this war would be short, with neither the time nor the need for mobilizing large land forces. The downsized army sought many ways to prove its relevance and "modern" qualities in a general war, and increasingly in a limited war, where, it argued, large strategic nuclear weapons were of little value. Not to

be underestimated as a major driving force, many viewed nuclear armaments as modern—the future of land combat—and that any “modern army” must possess the firepower even in a limited war. Battlefield nuclear weapons could also offset the numerical advantage of the communist bloc and even allow cuts in funding for troop strength.

By 1957, all branches of the U.S. armed forces had tactical nuclear weapons platforms in service or development for a variety of tactical missions. Army reorganization yielded a new dual-capable (atomic-nonatomic) “Pentomic” division. Organized as five semi-independent battle groups for greater mobility and dispersion on a highly lethal atomic battlefield, the division reduced manpower and increased firepower. All divisions included low-yield nuclear artillery in guns and missiles. The army also fielded nuclear nondivisional missile commands and 280-millimeter “atomic cannon” battalions. Engineer units could deploy tactical atomic demolition munitions to block enemy axes of advance. The army also developed atomic surface-to-air missile systems.

The Air Force Tactical Air Command role in supporting army ground forces focused training and procurement on nuclear-capable fighter-bombers. For responding to limited-war crises, the Tactical Air Command created the Composite Air Strike Force and trained primarily to deliver low-yield nuclear bombs. Additionally, the air force deployed nuclear surface-to-air and air-to-air missiles.

The Marine Corps developed greater mobility for amphibious forces by refining helicopter assault from offshore, believing traditional amphibious operations too risky in the atomic age. Marines fielded nondivisional atomic-capable artillery, and marine aviation could provide nuclear support.

Naval aviation was primarily trained and equipped to deliver tactical nuclear ordnance in support of ground forces. In addition, the U.S. Navy followed a nuclear path with atomic depth bombs for antisubmarine warfare and nuclear-capable surface-to-air missiles. Even shore bombardment from 16-inch battleship guns had optional nuclear warheads.

The Pentomic division received much criticism for not being mobile enough to survive an atomic battlefield and for not being strong enough to fight a conventional battle without using its nuclear artillery. By 1964, the army replaced it with a

traditional three-brigade structure. The new division maintained a nuclear capability, but the emphasis lay with conventional firepower. This change came from the realization that conventional war is more likely, especially in limited war. For the European battlefield, U.S. forces always maintained a tactical nuclear capability for the North Atlantic Treaty Organization; however, doctrine emphasized non-nuclear support of ground forces.

The end of the Cold War brought the Presidential Nuclear Initiative of September 27, 1991, which withdrew tactical nuclear weapons from the army, navy, and Marine Corps arsenals. As of 2012, only the air force maintains a stockpile of low-yield nuclear bombs, including the B61 Mod 11 deep-earth penetrator. Today, the use of low-yield nuclear weapons *in any role* is often popularly termed “tactical” use.

The September 11, 2001, attacks spurred debate over further developing tactical nuclear weapons for “bunker busting.” With unknown threats from rogue states given high priority, including the international crisis over Iranian nuclear ambitions, proponents argued that the United States needed improved capabilities to destroy deep underground facilities manufacturing or storing weapons of mass destruction.

However, despite this debate, the U.S. armed forces have not returned to the Pentomic Era, when the future of land combat appeared to include a nuclear battlefield that required dual-equipped forces. The capability remains for U.S. forces to be supported by low-yield “tactical” nuclear firepower; however, the vision of a nuclear battlefield and the perceived requirement for tactical nuclear weapons in multitudinous roles has faded.

PERSIAN GULF WAR

The Persian Gulf War was an international military conflict that occurred from August 2, 1990, to April 11, 1991. The conflict began with the invasion and subsequent occupation of the sovereign State of Kuwait by military forces of the Republic of Iraq. The invasion and occupation drew worldwide criticism, including from fellow Arab countries, which resulted in the passage of several UN Security Council resolutions condemning the aggression. Within hours of the occupation, military forces from the United States were quickly deployed to the region to defend Saudi Arabia against further Iraqi aggression. Over the next several months, an international coalition led by the United States began to assemble and train in the southern deserts of Saudi Arabia. On January 17, 1991, coalition air forces launched a massive air campaign to cripple key military targets both in Iraq and in portions of Kuwait itself. On February 24, 1991, coalition ground forces attacked Iraqi defensive positions along the Kuwait-Saudi and Iraq-Saudi borders. After just 100 hours of deadly combat, coalition ground forces ceased combat operations following the withdrawal of Iraq's military forces from Kuwait. This entry describes the political and military events of the conflict and discusses the war's legacy in its aftermath.

Background

State of Kuwait

In 1899, Sheikh Mubarak bin Sabah Al-Sabah, ruler of Kuwait, entered into an agreement with Great Britain wherein the British would provide military protection in exchange for Mubarak agreeing not to accommodate any foreign dignitaries or emissaries and to seek approval before any land cession or sale. Being perpetual in nature, the agreement also applied to any of Mubarak's future successors. In 1903, a railway proposed by Imperial Germany that would link Berlin with the Ottoman-controlled city of Baghdad was to provide access to the numerous trade routes in the Persian Gulf. Fearing that this railway would provide easy access to British holdings in the region in the event of war, Great Britain signed the Anglo-Ottoman Convention of 1913, which formally defined the limits of Ottoman rule in the Persian Gulf and established the official boundaries

of Qatar, Bahrain, and Kuwait. Ratification of the agreement, however, never came to be, providing a catalyst that later Iraqi rulers would try to exploit.

World War I

With the outbreak of the First World War in 1914, Great Britain, fearing German and Ottoman aggression, officially declared Kuwait an independent district but continued to provide military protection due to the strong German and Ottoman presence in neighboring Iraq. In the aftermath of the war, the newly created League of Nations mandated that Great Britain assume control of most parts of the region, ultimately granting independence to Iraq in 1932 and to Kuwait in 1961. Iraq would not officially recognize Kuwait or the location of its border until 1963. Large oil reserves had been discovered in Iraq in the late 1920s, and then in Kuwait and Saudi Arabia in the 1930s. The discovery of the natural resource resulted in an economic boom in the region but also caused disputes to erupt over border locations and drilling rights for the oil. Through its exportation of oil to nations such as the United States and China, the state of Kuwait had become one of the richest nations in the world by 1990.

Iran-Iraq War (1980–1988)

In 1980, fearing that the revolution that had taken place in neighboring Iran would spread to his country, Iraqi dictator Saddam Hussein ordered Iraq's military forces to invade Iran. Secretly, it was also Hussein's intention for Iraq to replace Iran as the major power in the region, and he believed that the political turmoil in Tehran would enable him to gain a quick victory. The Iraqi offensive quickly stalled, and the war became a stalemate. In 1988, both sides accepted the terms of UN Security Council Resolution 598, and the war came to an end. Despite having oil reserves of its own and accepting large amounts of financial support from Kuwait and Saudi Arabia, Iraq had incurred a huge war debt and faced a mounting financial crisis as the decade came to a close.

Provocation and Invasion

When the Iran-Iraq War ended in 1988, a virtually bankrupt Iraq asked its creditors, of which Saudi Arabia and Kuwait were the primary holders, to forgive its war debt, which totaled more than

\$80 billion. However, both Arab nations refused, citing economic problems of their own due to the surplus of oil on the world market, which was keeping crude prices low. Finding no relief through negotiation, Hussein began to make accusations that members of the Organization of the Petroleum Exporting Countries, particularly Kuwait, were intentionally ignoring the production limits it had set in an effort to keep prices low, which, in turn, prevented Iraq from gaining the badly needed export revenue. Hussein also directly accused Kuwait of stealing oil from Iraqi fields through the practice known in the oil industry as “slant drilling,” a process that allows access to oil that cannot otherwise be obtained through the normal practice of vertical drilling. Elevating his rhetoric, Hussein began making threats that he would attack any oil-producing nation that did not cease the overproduction of oil and began moving troops to the Iraq-Kuwait border in late July 1990. Diplomatic efforts by the United States to stave off an armed conflict between the two Arab nations seemed to hit road blocks at every turn.

The 19th Province

While attempts at a diplomatic solution continued between the United States, Kuwait, and Iraq, Saddam Hussein ordered his military forces to invade Kuwait. During the predawn hours of August 2, 1990, Iraqi military forces crossed the border and overwhelmed the emirate in just a matter of days. To avoid capture and set up a government-in-exile, Kuwait’s emir, Jabir al-Ahmad al-Jabir al-Sabah, along with his family, government officials, and the remaining military forces, fled Kuwait City and sought refuge in neighboring Saudi Arabia. Within hours, the UN Security Council convened and passed Resolution 680, condemning Iraq for its aggressive behavior and demanding that all Iraqi military forces be withdrawn. Meanwhile, a victorious Saddam Hussein proudly announced to the world that Kuwait had become Iraq’s 19th province, claiming that the Anglo-Ottoman Convention of 1913 never received ratification, had no authority, and therefore Kuwait remained a part of Iraq.

Multinational Response

By the time the emir arrived in Saudi Arabia, international outrage over the invasion already had taken center stage thanks in part to the burgeoning

new form of media that broadcast news around the clock. After quickly occupying Kuwait City and its oil fields, the Iraqi military moved south and swiftly closed the border with Saudi Arabia. In addition to asking for the UN Security Council to convene and demand Iraq’s immediate withdrawal, President George H. W. Bush consulted with his top political and military advisors to formulate a response. A strategy that would use a combination of political, economic, and military pressures to force Iraq out of Kuwait took form and was then implemented.

Political and Economic Pressure

Knowing that the United States would be hard pressed to force Iraq out of Kuwait on its own, President Bush began the arduous task of assembling an international coalition. Bush also knew that he would need to work through the UN Security Council to justify and authorize both military and nonmilitary actions that might be implemented. Bush also dispatched Secretary of Defense Dick Cheney and U.S. Central Command Commander General H. Norman Schwarzkopf to Saudi Arabia to personally inform the Saudi king Fahd bin Abdul Aziz Al Saud that if needed, military forces from the United States were available for defense of his kingdom. The king immediately asked for military assistance for Saudi Arabia’s defense and indicated that he would provide troops from his own military forces not only to help in his nation’s defense but also to participate in the eventual liberation of Kuwait. The United Nations imposed severe economic sanctions on Iraq beginning just after the invasion. The European Community imposed economic sanctions of their own in the form of embargoes of oil imports, arms sales, and various other goods and services. Known Iraqi assets in the United States, Great Britain, France, and other coalition countries were frozen, denying Iraq access to millions of dollars in revenue. President Bush also ordered that the United States, for the purpose of denying Iraq revenue gained from trade, impose a complete economic embargo against Iraq.

Israel

Since its official creation in 1948, the State of Israel had fought several wars with its Arab neighbors; so when Iraqi military forces swept into Kuwait, the Israeli government, led by the Israeli

prime minister Yitzhak Shamir, ordered the Israeli Defense Forces to prepare for the possibility of a conventional military strike by Iraq and also a chemical weapons attack. For more than 40 years, Israel had maintained a posture of retaliation to any aggressor, Arab or otherwise, and Saddam Hussein knew that if he could provoke Israel to respond militarily, the Arab members of the coalition forming against him might feel the pressure to come into the conflict as allies or withdraw altogether.

An Unprecedented Military Coalition

To defend Saudi Arabia from possible further aggression by Saddam Hussein, the United States took up defensive positions along the Kuwait-Saudi border and along the Saudi-Iraq border. As the conflict progressed, more than 30 nations, including Muslim nations located in the Middle East, would form an unprecedented yet solid international coalition in support of the effort to free occupied Kuwait. The United States, Saudi Arabia, and the United Kingdom would supply the majority of military personnel, equipment, and supplies needed for ousting Iraq from Kuwait.

Operation Desert Shield

On August 7, 1990, under the operational code name Desert Shield, President Bush ordered naval, ground, and air forces of the United States to Saudi Arabia for its defense and, if needed, for possible offensive operations. Within 48 hours, aircraft and ground units began to arrive. Supplies that had been prepositioned for just such an operation were sent to the region. Within 14 days, the first armor and cavalry units, fielding the new M1A1 Abrams main battle tank, began to arrive. These highly trained units were deployed to help support the light infantry forces that were maintaining a thin line of defense positions just inside the Saudi border with Kuwait. Over the next several weeks, the U.S. Department of Defense began flexing its logistical muscle by activating the forces necessary to meet the demand for supplies required not only to maintain a military force but also to support offensive combat operations when called on to do so. As a result, the Strategic Air Command of the U.S. Air Force and the Military Sealift Command of the U.S. Navy immediately implemented the necessary action plans that had been in place since the 1950s.

Desert Training

General Schwarzkopf and his commanders knew that operating in a desert environment presented challenges for both the military equipment that would be necessary and, more important, for the troops themselves. Schwarzkopf also knew that during the Iran-Iraq War, Saddam Hussein had ordered the use of chemical agents against Iranian military forces, and he stressed this point to his commanders. Among the troops sent in support of the coalition were chemical warfare specialists from the Czech Republic who were familiar with the chemical weapons that Iraq had obtained from Warsaw Pact members and could be deployed. By January 1991, more than 695,000 troops, 1,650 aircraft, and 174 warships from Argentina, Australia, Bahrain, Bangladesh, Belgium, Canada, Denmark, Egypt, France, Greece, Italy, Kuwait, Morocco, The Netherlands, New Zealand, Niger, Norway, Oman, Pakistan, Portugal, Qatar, South Korea, Saudi Arabia, Senegal, Sierra Leone, Singapore, Spain, Syria, the United Arab Emirates, the United Kingdom, and the United States itself were positioned in the Kuwait theater of operations.

One problematic issue regarding the buildup of coalition forces on the Arabian Peninsula concerned how Israel would respond if attacked by Iraqi military forces, as had been insinuated by Saddam Hussein and his foreign minister, Tariq Aziz. Both the Israeli Defense Forces and the coalition forces now assembling in southern Saudi Arabia knew that the Iraqi military had Soviet-built Scud medium-range ballistic missiles in its arsenal. What concerned them the most was an upgraded version of the Scud known as the "Al Hussein," which had an extended range and could be fired from mobile launchers, making it easily concealable and difficult to defend against.

Desert Shield Becomes Desert Storm

On November 29, 1990, the UN Security Council passed its final resolution demanding that Iraq must unconditionally withdraw from Kuwait. This resolution, however, added a deadline for withdrawal of January 15, 1991, and authorized the use of military force if Iraq did not comply. With Saudi Arabia's airports jammed with coalition war planes and the waters of the Persian Gulf crowded with coalition warships, the world held its breath as this final

deadline approached and then passed. On January 17, 1991, with Iraqi military forces still firmly occupying Kuwait, the coalition forces launched their military campaign, codenamed "Desert Storm," to liberate Kuwait.

Air Campaign

During the early morning hours of January 17, 1991, more than 700 coalition aircraft assembled and then proceeded to their designated targets in Iraq, most notably Baghdad. As the opening attack unfolded, Cable News Network reporters Bernard Shaw, John Holliman, and Peter Arnett reported on the attack live from Al-Rashid Hotel in Baghdad. Engineered by U.S. Air Force Lieutenant General Charles A. Horner, more than 110,000 sorties would be flown over the next 43 days, with more than 88,000 tons of ordnance being dropped on targets in Iraq and Kuwait. U.S. Air Force Captain Steve "Tater" Tate recorded the first aerial kill of the campaign when he downed an Iraqi Mirage F1 near Baghdad on January 17, 1991.

Scud Missile Attacks

During the later part of the air campaign, coalition air forces began an active search for any remaining targets, especially Scud missile launch sites. From the outset, the problematic issue of a possible Israeli military response if attacked by Iraq remained a primary concern. Leaders of both the Israeli Defense Forces and the coalition forces now assembling in the desert knew that the Iraqi military maintained an arsenal of ballistic missiles capable of delivering not only a conventional high-explosive warhead but also a warhead loaded with biological and chemical weapons. Another concern involved the fact that these missiles could be launched from a stationary platform or from a mobile launcher that could easily be moved between launch sites and could also be hidden in buildings or even underground. Hussein knew that a military response by Israel against Iraq would hurt the efforts of the United States to keep the coalition forces together. On January 18, 1991, Iraq launched its first Scud attack of the war, targeting Israel and Saudi Arabia. Uncharacteristically, Israel did not respond to the attack or to any of the more than 40 other Scud attacks during the war. To aid in its defense, the United States sent a battalion of MIM-14 Patriot missile batteries to Israel. Though

largely ineffective, one Scud missile did hit a barracks that housed U.S. military personnel in Dhahran, Saudi Arabia, killing 28 and wounding more than 100 others. U.S. and British Special Forces had been operating for several weeks in Iraq before the actual air and ground campaigns began.

Ground Campaign

For 38 days, coalition air forces pummeled Iraqi defense positions, air defense and radar stations, known troop locations, airfields, and other military emplacements that posed a threat, inside Kuwait and Iraq itself. Coalition ground forces had been building and training for months, and on February 24, 1991, they began a massive ground campaign to liberate the State of Kuwait. Two days earlier, at designated points along the heavily defended border, two U.S. Marine Corps Task Forces crossed into Kuwait and began clearing minefields, tank traps, and bunkers. Iraqi intelligence had expected the attack to begin in the exact spots where the marines were now operating, and the area had been heavily reinforced. As the Iraqi military forces focused on the actions of the marines, they failed to notice the northern movement of other coalition forces along the Saudi-Iraqi border. On February 24, 1991, spearheaded by the U.S. VII Corps (the army unit deployed during Operation Desert Storm) and XVIII Airborne Corps (designed for rapid deployment anywhere in the world), along with the British 1st Armored Division and the French 6th Light Armored Division, the coalition forces quickly drove through the lightly defended border and executed what would be described as a "left-hook" blow. The plan called for coalition forces that had been spread out along both the Kuwait and Iraq borders with Saudi Arabia to quickly destroy and maneuver through the Iraqi defenses and penetrate deep into southern Iraq. Then, at the appointed time and place, the coalition forces turned 90 degrees right and hit the Iraqi military, just like a boxer would turn his body right to throw a left-hook punch at his opponent. Stunned and overwhelmed, Iraqi troops could only offer token resistance and began to retreat or surrender in large numbers. On the right flank of the advance, British units attacked Iraq's elite Republican Guard, which put up a much stiffer defense than those Iraqi units encountered during the early hours of the attack. The advance moved

much quicker than expected, and within 48 hours, coalition forces had reached the Euphrates River, had turned south, and were approaching Kuwait from the north.

Liberation and Cease-Fire

Simultaneously, on the eastern end of the line of attack, the 1st Marine Expeditionary Force, consisting of the 1st and 2nd Divisions and the U.S. Army's 1st Brigade of the 2nd Armored Division, and supported by various units of Islamic troops, attacked and pushed through the Iraqi defenses on its way to securing the Al-Jabr air field. As the force approached Kuwait City, the Iraqi defense hardened but quickly collapsed altogether when the coalition forces secured Kuwait International Airport and began preparing for the final push into Kuwait City itself. On February 27, 1991, after Saddam Hussein ordered his troops to withdraw from Kuwait, resistance collapsed as coalition troops from Saudi Arabia and Kuwait spearheaded the final push into the city. With coalition forces approaching from the north and the south, the situation became hopeless for the retreating Iraqi forces. Hundreds of tanks, trucks, artillery pieces, and weapons systems that had not already been destroyed were abandoned as the Iraqi troops retreated. In the final hours of the conflict, a road clogged with fleeing Iraqis came under attack by coalition aircraft and was decimated, with hundreds of destroyed vehicles and lifeless bodies littering the highway. A few hours later, realizing that the coalition's primary objective of liberating Kuwait had been achieved, President Bush ordered a halt to offensive military operations, effective February 27, 1991, 100 hours after the operation to free Kuwait began.

Legacy

Coalition forces began to redeploy back to their homelands beginning in March, but military forces would remain in the area until 1995 due to the volatility of the region, caused primarily by the formidable military force still brandished by Saddam Hussein. From 1991 until his capture by the allied forces in 2003, Saddam Hussein would pose a threat not only to his Arab neighbors but also to his own people. For the United States, the Persian Gulf War forced the Department of Defense to

further rethink its offensive and defensive strategies beyond what changes had taken place as a result of the decline of the communist influence in Europe in 1989. For years, the United States, along with its North Atlantic Treaty Organization allies, had concentrated on defending Western Europe against a Soviet-led attack. Now, these forces had to take into consideration the Middle East in its military planning. The changes would include the possibility of a long-term presence in the area, such as what occurred in Europe in the aftermath of World War II. Also, new and improved equipment for the military forces would have to be designed for the harsh desert climate. Many questions concerning what the future would hold for the region were answered when another coalition, led by another President Bush, invaded Iraq in 2003.

PERSONNEL EVALUATION

Just as many of the country's civilian, private sector employees receive personnel evaluations assessing their on-the-job performance, so, too, do our nation's men and women in uniform. Each of the five branches of the U.S. armed forces evaluates its personnel somewhat differently; although personnel are generally evaluated annually, raters are usually the immediate supervisor of the individual being evaluated, and an appeals process exists for those who feel they have been evaluated unfairly. These military personnel evaluations record that raters and ratees agree about the ratees' responsibilities. They assess the ratees' performance to date, and they explain in writing how the ratees might better realize their potential in the future. The reports generated help guide an individual's career path and aid military leadership in the identification and selection of future leaders. Though seemingly sensible and well intentioned, some commonly cited flaws plague these evaluation systems. This entry discusses the personnel evaluation systems of each of the branches of the U.S. armed forces and examines the impact of these evaluations.

Army: The Army Evaluation Reporting System

The U.S. Army Human Resources Command, under the army's deputy chief of staff for personnel, or G1, oversees *the army's evaluation reporting system*. Governing documents are Army Regulation 623-3, *Personnel Evaluation: Evaluation Reporting System*, and Department of the Army Pamphlet 623-3. According to these documents, the evaluation reporting system provides a framework to assess the quality of an individual soldier. It produces a report card, if you will. This helps not only to determine the course of the said soldier's career (what assignments, trainings, and promotions he or she might receive) but also to identify future army leaders.

Air Force: The Air Force Officer Evaluation System and Enlisted Evaluation System

The Air Force Personnel Center oversees the air force's evaluation programs. Governing documents are Air Force Policy Directive 36-24, *Military Evaluations*, and Air Force Instruction 36-2406,

Officer and Enlisted Evaluation Systems. Air Force Instruction 36-2406 explains that the purposes of the Officer and Enlisted Evaluation Systems are threefold. First, they affirm that ratees know what is expected of them, assess how well they are currently meeting those expectations, and explain how they might better do so in the future. Second, the systems provide a written, long-term record of performance and an individual's potential based on that performance. Third, the evaluations help the chain of command identify and promote future leaders.

Navy: The Navy Performance Evaluation System

The Navy Personnel Command administers the navy's performance evaluation system (PES). Bureau of Naval Personnel Instruction 1610.10C, with enclosures, explains the system, which consists of Fitness Report and Counseling Records on officers, chief petty officer evaluations on chief petty officers, and Evaluation Report and Counseling Records on other enlisted personnel. The evaluations are used for many career actions, including selection for promotion, advanced training, specialization or subspecialization, and responsible duty assignments.

Marine Corps: The Marine Corps Performance Evaluation System

The deputy commandant of Manpower and Reserve Affairs administers the Marine Corps PES. Marine Corps Order P1610.7F governs the system and explains that the PES primarily supports the centralized selection, promotion, and retention of the most qualified marines. In other words, the Marine Corps sees the system as first and foremost a framework to identify future leaders. Second, in the near term, if you will, the PES aids in the assignment of personnel and supports other miscellaneous personnel management decisions as required.

Coast Guard: The Coast Guard Officer Evaluation System and Enlisted Evaluation Reporting System

The Coast Guard Pay and Personnel Center administers Coast Guard evaluations. The Guard recently cancelled its personnel manual, also known as Commandant Instruction M1000.6A, and replaced it with 12 new manuals or instructions, loosely

aligned with the existing chapters in the former personnel manual. These new manuals state that the Coast Guard's officer evaluation system provides information for important personnel management decisions such as promotions, assignments, career development, and retention; sets performance and character standards to evaluate each officer; prescribes the organizational values by which each Coast Guard officer can be described; and provides a means of feedback to determine how well an officer is measuring up to the standards.

Similarly, the enlisted evaluation reporting system sets standards by which to evaluate the performance and behavior of all enlisted members; informs enlisted members of the performance standards against which they will be measured; provides a means by which enlisted members can receive feedback on how well they are measuring up to the standards; captures a valid, reliable assessment of enlisted members' performance, so the Coast Guard may advance and assign members with a high degree of confidence; and provides critical information that may affect discharges, reenlistments, good conduct, advancement eligibility, and reductions in rate.

The Impact of the Personnel Evaluation

The importance of accurate and constructive military personnel evaluations cannot be overestimated when the reports generated from the evaluation programs have such an impact on individual servicemen's and servicewomen's livelihoods, on selecting the future leadership of the military, and arguably, by extension, on national security. Yet the systems have some obvious flaws.

While critiques of military personnel evaluation systems abound, inflated evaluations might be the most lamented problem. Such evaluations result when raters "inflate" assessments to allow ratees to remain competitive among their peers, instead of recording the constructive criticisms truly needed. Most of the regulations and governing documents discussed above warn against inflation, and academic papers and military studies on this topic abound. An inflated rating can be more than unfair; it can be positively dangerous if it earns a less than qualified individual an ill-fitting assignment or an undeserved promotion.

The inflated evaluation occurs when a rater, consciously or even subconsciously, seeks to protect

and promote the career of a presumably well-liked subordinate. But just as a rater can exploit the subjectivity inherent to the evaluation process to "help" an inferior, so, too, can he or she exploit the process to hinder a subordinate's career. The evaluation becomes a tool with which the rater can punish a subordinate and mark him or her for unjust failure. This may occur simply due to personality conflicts, or it may allow for more targeted discrimination on the basis of race or gender.

Other detractors of military personnel evaluation systems question their methodologies, effectiveness, ethicality, and so on. At the heart of most of the issues raised lies the fact that the personnel evaluation systems are unavoidably subjective. One rater's "excellent," to use a generic term, is another's "satisfactory." Critics even argue that changes made to personnel evaluation systems in an attempt to ensure fairness and objectivity have been circumvented by raters. For example, mandatory quantifications of "excellent" ratings simply mean that the rater must write an inflated explanation of the "excellent" rating in addition to checking the "excellent" box. Fortunately, the military realizes that there remains work to be done.

It should be noted that appeals processes allow personnel who feel they have been inaccurately rated to seek recourse, but those appeals can be long and arduous battles. Real reform, which is ongoing, is needed to ensure accurate and meaningful personnel evaluations.

PETRAEUS, DAVID

General David Howell Petraeus was born on November 7, 1952, in Cornwall on Hudson, New York. He graduated from the United States Military Academy at West Point in 1974 as a distinguished graduate, finishing in the top 5% of his class. Petraeus received the George C. Marshall Award for graduating first in his class at Command and General Staff College in 1983. He earned a master's degree (1985) and a PhD in international relations (1987) from Princeton University's Woodrow Wilson School of Public and International Affairs. After early assignments in mechanized units, Petraeus principally served in light infantry units. He commanded the 3rd Battalion of the 101st Airborne Division (1991–1993), served as chief of operations of the UN peacekeeping mission in Haiti (1995), and commanded the 1st Brigade of the 82nd Airborne Division (1995–1997). After promotion to brigadier general, he served as assistant division commander (operations) of the 82nd Airborne Division and chief of staff of the XVIII Airborne Corps (the corps of the U.S. Army designed for rapid deployment anywhere in the world), before deploying to Bosnia and Herzegovina in Operation Joint Force as assistant chief of staff for operations of the North Atlantic Treaty Organization Stabilization Force and deputy commander of the U.S. Joint Interagency Counter-Terrorism Task Force (2001–2002). He led the 101st Airborne Division in combat in Operation Iraqi Freedom (2003–2004) and returned to Iraq as the first three-star commander of Multi-National Security Transition Command, Iraq, which trained and equipped Iraq's security forces (2004–2005). He headed the U.S. Army Combined Arms Center at Fort Leavenworth (2005–2007), before returning to Iraq a third time to command Multi-National

Forces, Iraq (2007–2008). He led the U.S. Central Command (2008–2010) and assumed command of U.S. Forces-Afghanistan and the North Atlantic Treaty Organization International Security Assistance Force in Afghanistan in June 2010, following the relief of General Stanley McChrystal. This entry looks at the career and views of David Petraeus.

General Petraeus has made three principal contributions to military thought and art. First, he refined the precepts of counterinsurgency for application in the 21st century and successfully inculcated understanding and acceptance of counterinsurgency among U.S. conventional forces, which had shunned it in the wake of its defeat in the Vietnam War. More broadly, he embodied and championed intellectualism and innovativeness as essential qualities for military leadership. Finally, he understood how to implement and lead change in large, hierarchical organizations to make them more agile and adaptive.

Shaping Views

The most profound influence on the young officer's development was General John R. Galvin, a soldier-scholar and, later, statesman, whom he served first as aide de camp (1981–1982) when the latter commanded the 24th Infantry Division (Mechanized) and then as his special assistant when Galvin led the U.S. Southern Command and served as Supreme Allied Commander, Europe, in the 1980s. Galvin, who later became diplomatic envoy to the Balkans, engaged Petraeus in lengthy discussions about the challenges of leadership and the issues of the day and encouraged him to attend graduate school. Petraeus received his first exposure to counterinsurgency with Galvin at Southern Command, which was preoccupied with the insurgencies then roiling Latin America. He helped Galvin write an article, "Uncomfortable Wars: Toward a New Paradigm," published in *Parameters* in 1986 that argued that instead of preparing to fight in ways that fit "our plans, our assumptions, our hopes, and our preconceived ideas," the U.S. military needed to be prepared to grapple with conflicts that lay outside its comfort zone. The "uncomfortable" wars of that time were the insurgencies, postcolonial liberation struggles, and Cold War proxy contests between the United States and the Soviet Union not only in

Central and South America but also in Africa and Afghanistan.

Petraeus explored this issue and the legacy of Vietnam in his doctoral dissertation *The American Military and the Lessons of Vietnam: A Study of Military Influence and the Use of Force in the Post-Vietnam Era*, which he completed during his assignment as an assistant professor at West Point from 1985 to 1987. He interviewed a wide range of military leaders as part of his research and concluded that, just as in the aftermath of the Korean War, the post-Vietnam military leadership had become extremely cautious about involvement in conflicts abroad. This stance, which became known as the Weinberger and later the Powell Doctrine, held that the U.S. military should only intervene when vital U.S. interests were at stake, ample American public support existed, and a clear exit strategy had been developed. Petraeus sided with those who judged that the United States, as a world leader, would likely need to intervene in conflicts that posed serious if not existential threats and would be forced to make difficult choices about the degree and duration of involvement warranted.

Debates over U.S. intervention continued as the Cold War-era conflicts gave way to various humanitarian crises and ethnic turmoil in Haiti, the Balkans, and elsewhere in the 1990s. Petraeus witnessed these firsthand with assignments in multinational peacekeeping operations, and as aide to Army Chief of Staff General Carl Vuono and as executive assistant to the chairman of the Joint Chiefs of Staff General Hugh Shelton (1997–1999), he also gained additional firsthand lessons in leadership and the military's role in advising civilian decision makers. In the latter position, he observed the intersection of politics, policy, and strategy during the Desert Fox operations against Iraq, the strikes on Osama bin Laden in the wake of the East Africa embassy bombings, and the Kosovo campaign.

Counterinsurgency Field Manual Revision

During his first tour in Iraq, Petraeus waded into the intricacies of Iraq's multiethnic and multisectarian society, foreseeing that postwar strife would erupt if a stable balance of power were not struck. On his second tour, he grappled with the demands of building Iraq's police and armed forces while the insurgency gained in strength. He then moved

to Fort Leavenworth as commander of the army's Combined Arms Center, the subordinate entity of the army's Training and Doctrine Command, with orders from Army Chief of Staff General Peter Schoomaker to "shake the army up." The army had been undergoing a transformation from division-focused organization to modular brigades, but as the grim reality of a failing war effort in Iraq set in, Petraeus made his top priority the revision of the U.S. Army counterinsurgency field manual in partnership with the U.S. Marine Corps. An interim manual had been hastily issued, but no full-fledged revision of the manual had been undertaken since the Central American wars 20 years earlier.

In what would become a signature method, Petraeus convened a diverse group of top counterinsurgency experts in and out of uniform rather than rely solely on his doctrine-writing division. In deliberations resembling a free-wheeling, high-level graduate seminar, academics, diplomats, aid workers, representatives of nongovernmental organizations and human rights groups, journalists, and others with experience in recent wars gathered at Fort Leavenworth to debate intensively and critique an initial draft of the manual written by a group of hand-picked associates. Petraeus eventually assumed control of the document and produced numerous further iterations before its publication in December 2006 as U.S. Army Field Manual No. 3-24 and Marine Corps Warfighting Publication No. 3-33.5 (hereafter referred to as FM 3-24).

The central idea of the manual is that the population is the decisive terrain in counterinsurgency. This insight draws on the work of David Galula (which emphasizes the need to protect the population), historical British counterinsurgency experience, and Max Manwaring's work on the importance of legitimacy in inherently political struggles. The population is deemed to be the decisive terrain in a counterinsurgency because insurgents hide among the people and rely on them for sustenance. A successful counterinsurgency therefore depends on gaining the population's cooperation in identifying and isolating the adversary from his means of support. The population ultimately determines a campaign's success, because the people decide which side they will support and which side they view as legitimate. Protecting the population is the principal means to gain the population's support, which is not only a strategic goal but also a tactical

necessity to obtain the intelligence needed to isolate the insurgent.

The Field Manual identifies and refines several key corollaries to this central idea, including the need to secure the population by dispersing counterinsurgent troops to live among the people and protect them. This precept is sometimes misinterpreted as meaning primarily U.S. or coalition forces, but the ideal counterinsurgents are local forces of the host country if they exist in sufficient numbers and are capable and accepted by the population. In Iraq, U.S.-led coalition forces initially outnumbered and/or outperformed the host forces.

FM 3-24 also calls for a persistent effort by counterinsurgents to hold territory and build governing institutions. The forces must remain in place to secure and win over the population, obtain the necessary intelligence to isolate the insurgent cadre and fighters, and assist in the provision of basic services until the host government (which may be a substate or traditional form of governance) is able to provide the necessary security and governance. Insurgents commonly attempt to wait out the counterinsurgent.

Achieving unity of effort among civilian and military counterinsurgents is vital to the success of operations. The manual also emphasizes the need for proactive and accurate information operations (“be first with the truth”) and to foster initiative at all echelons. It posits that the side that adapts fastest wins the contest; therefore, a premium is placed on rapidly processing lessons from the field and adapting the campaign plan as necessary. Another key tactic, which Petraeus emphasized even more following his third tour in Iraq, is an effort to turn insurgents who prove to be “reconcilable,” while targeting and capturing or killing those deemed “irreconcilable.”

While these precepts are rooted in historical experience and literature, Petraeus refined them for application to complex insurgencies with transnational elements in a highly transparent and dynamic environment. He emphasized the central importance of protecting the population and pursuing political solutions while targeting adversaries precisely in intelligence-driven operations. He propagated understanding and embrace of these ideas throughout the U.S. conventional forces and the public generally by launching an extensive communications and education campaign, which led to the publication of numerous articles, a commercial edition of the manual, its review by the *New York Times*,

and the revision of curricula throughout the military school system. Petraeus also oversaw ongoing improvement of predeployment counterinsurgency training at the national training centers and more rapid means to collect, process, and disseminate lessons from the battlefield for those in the field and those preparing to deploy.

A “Strategic Counterinsurgency Command”

When General Petraeus returned to Iraq in February 2007 as commander of Multi-National Forces, Iraq, he assembled a group of multidisciplinary, multinational experts co-led by a trusted officer and a diplomat. Commanders routinely conduct such initial assessments, but his assessment was an unusual application of operational design principles in its degree of depth, rigor, and diversity. The Joint Strategic Assessment Team’s intensive 3-month assessment of the country and the war’s history and present status led to a redesigned joint campaign plan in which the embassy country team participated. The plan identified the overarching objective of reconciliation as the war’s political solution and specified a tailored mix of political, diplomatic, economic, security, and informational operations designed to address the particular conditions and causes of conflict in the varied demographic mosaic that is Iraq. The “puzzle diagram” was created as part of the commander’s briefing to depict the campaign plan’s sophisticated application of the FM 3-24 counterinsurgency principles to the specific requirements of Iraq’s war.

To implement this campaign plan, Petraeus adapted the Multi-National Forces, Iraq, headquarters into what he called a “strategic counterinsurgency command.” He revised the traditional Napoleonic staff structure to create integrated, cross-functional, civil-military “fusion cells” and nodes that focused on critical aspects of the campaign plan—for example, strategic communications, detainee operations, efforts to “turn” insurgents, and critical issues such as energy, infrastructure, and employment. The reconciliation initiative drew 100,000 former insurgents and insurgent supporters as the campaign gained steam. Violence declined dramatically in the latter half of 2007 and remained low as the multifaceted campaign continued. Core political issues between Sunni and Shia Arabs and between Arabs and Kurds remained to be resolved as U.S. forces drew down in 2010.

Later Successes

After 2 years at the helm of Central Command, due to the strength of his successes in Iraq, Petraeus was called on to take command of the International Security Assistance Force in Afghanistan in June 2010. In April 2011, President Barack Obama nominated Petraeus to become director of the Central Intelligence Agency. Retiring from the U.S. Army on August 31, 2011, Petraeus assumed the duties of the agency's director on September 6, 2011. In November 2012, Petraeus resigned abruptly and confessed that he had had an affair with his biographer, Paula Broadwell.

Petraeus gained recognition as a skillful practitioner of large-scale counterinsurgency and more generally for his political and diplomatic acumen and military skill in orchestrating multifaceted, complex campaigns. He used these skills and methods to act as a change agent within the U.S. military to spark a climate of inquiry and innovation. Petraeus has empowered the lower echelons to take the initiative and adopt practices that produce better results. He has noted that his goal is to teach subordinates *how* to think rather than *what* to think, and many of those in uniform have responded by attending graduate school, publishing probing essays, and questioning the status quo.

PHILIPPINES

The archipelago, formally known as the Republic of the Philippines, is composed of 7,107 islands located in the western Pacific Ocean in Southeast Asia, between the Philippine Sea and the South

China Sea. The country's estimated population in 2010 was 99,900,177. The Filipino people are of a Malayo-Polynesian ethnic background. The islands' original inhabitants, Negritos, arrived about 30,000 years ago via land bridge and/or boats from Sumatra and Borneo. This settlement was followed by migration waves from Taiwan, Malaysia, Indonesia, and mainland China. As a result, more than 180 different languages and dialects are spoken throughout the Philippines, with Tagalog and Cebuano being the most common. Currently, Filipino (based on Tagalog) and English are the country's two official languages, and public education is offered in both. Ninety-three percent of Filipinos aged 10 and above are literate. More than 80% of Filipinos describe themselves as Catholic, a legacy of Spanish colonization, while about 5% embrace Islam. This entry discusses the government and history of the Philippines, with a focus on the Philippines's independence, its armed forces, and its relationship with the United States.

Geography and Economy

The Philippines total approximately 115,830 square miles, an area slightly larger than the state of Arizona, with 22,549 miles of coastline. The island nation is divided into three main geographical regions: (1) Luzon (which contains the capital city of Manila), (2) Visayas, and (3) Mindanao. Well over half of the terrain in the Philippines is mountains, with Mount Apo on the island of Mindanao being the country's highest peak at 9,691 feet. Water is the other main natural feature. Almost all the islands contain navigable rivers, numerous lakes, bays, harbors, and gulfs, plus mineral springs and waterfalls. The lush beauty of the Philippines is periodically marred by volcanic eruptions, earthquakes, and tsunamis. The tropical marine climate includes a northeast monsoon season that stretches from November to April and a southwest monsoon season from May to October.

The economy of the islands is rooted in natural resources and agriculture. The Philippines generate lumber products, salt, and petroleum; cultivate sugarcane, coconuts, rice, corn, bananas, cassava, pineapples, and mangoes; raise cattle and fish; and mine gold and silver. Overall, 19% of the islands is arable land. Industry, including electronics assembly, garment and footwear manufacturing, and

pharmaceuticals, also significantly contributes to the economy. Additionally, many Filipinos work overseas, sending the bulk of their income back home. The country's gross domestic product in 2008 was \$168.6 billion (\$3,400 per capita), with a 7.4% unemployment rate.

Government and Armed Forces

The government of the Republic of the Philippines has three branches that are modeled on those of the United States, its second colonizing power. The executive branch is represented by the president, who is both head of state and head of the government. The president, who is restricted to a single 6-year term under the 1987 constitution, and the vice president are elected by separate tickets based on a popular vote from an electorate of Filipinos 18 years old and above. The legislative branch consists of a bicameral Congress. The Senate has 24 seats; senators serve 6-year terms, with half of the members elected every 3 years. The House of Representatives has 250 seats, and its members have 3-year terms. The judicial branch is presided over by the Supreme Court, made up of a chief justice and 14 associate justices, who serve until the age of 70. There is also a court of appeals and a *Sandiganbayan*, a special court that handles corruption cases of government officials. To facilitate local administration, the Philippine Islands are divided into 80 provinces and 120 charter cities.

First designed in 1897, the flag of the Republic of the Philippines displays a banner of blue (peace and justice) and one of red (courage), plus a white triangle (equality). The three gold stars inside the triangle designate the major geographical divisions of the islands, and the eight rays of the sun represent the first Philippine provinces to secure independence from Spain.

The Armed Forces of the Philippines (AFP) are composed of three branches, (1) the army, (2) the navy (including the marines), and (3) the air force, and are headquartered at Camp General Emilio Aguinaldo, Quezon City, Metro Manila. As of 2011, there were 125,000 active members and 130,000 reservists. The president of the Philippines serves as commander in chief, working closely with the secretary of national defense. The AFP chief of staff is the military advisor to the secretary but ultimately takes his orders from the president and the secretary. The AFP's primary duty is to maintain domestic

peace, but since the 1970s, the military has become highly politicized, frequently attempting to influence the course of civilian government. Additionally, the AFP faces continuing challenges from separatist and other terrorist groups, especially in the southern islands.

History

In 1521, the Portuguese explorer Ferdinand Magellan, looking for a westward route to the Spice Islands of Indonesia, reached the Philippine Islands and claimed them for Spain. But Magellan grew overconfident after a warm welcome on Cebu, and he died at the hands of warriors on Mactan Island, who resisted the Spanish intrusion. It was not until Miguel Lopez de Legazpi was sent in 1565, with more than 2,000 additional Spaniards soon following, that Spain gained an actual foothold in the Philippines. Under orders from King Philip II, Legazpi divided the Philippines into *encomiendas* (large territories), which were administered by Spaniards who collected taxes and were in turn responsible for protecting the local inhabitants by providing law and order as well as health and educational programs. Conversion to Catholicism was also carried out in these *encomiendas*, often with the assistance of Spanish Jesuits.

The viceroy of Mexico initially directed Spain's colonial administration of the Philippines, aided by a specially designed government body called the Council of the Indies. The governor-general, stationed in the capital of Manila, reported to the viceroy until 1821, when Mexico achieved independence from Spain. Except for a period of about 2 years in the 1760s, when the British occupied Manila and the naval port of Cavite during the Seven Years' War, the Spanish maintained their colonial hold on the Philippines until the end of the 19th century.

By the second half of the 1800s, Philippine nationalism was gaining strength, especially among the *ilustrados* (European-educated Filipinos). Between Spain's loss of Mexico, its decision to open the Port of Manila for foreign trade, and the increasing wealth of Filipino *mestizo* (a term traditionally used in Spain and Latin America for people of mixed heritage or descent) families, Spain's colonial authority seemed particularly vulnerable by the latter part of the century. Even Filipino priests pushed for equality with their Spanish counterparts.

Led by Andres Bonifacio, in 1892, rebels on Luzon started the *Katipunan*, a secret organization dedicated to Philippine independence. The Katipunan engaged in armed resistance and assassinations, and it functioned as an alternate Philippine government. In 1896, the Spanish authorities learned of the existence of the Katipunan, and they executed the writer and artist Jose Rizal y Mercado, a popular nationalist. These two events launched the Philippine Revolution.

Origins of the Philippine Military

In 1897, Emilio Aguinaldo y Famy, part of an elite family from Cavite and a member of the Katipunan, emerged as the leader of a new revolutionary government. Aguinaldo then created the Philippine army, with General Artemio Ricarte at its head, and soon afterward, he formed the Bureau of the Navy. Continued Spanish advances on Filipino rebel forces led Aguinaldo to seek exile in Hong Kong later that year. As part of an agreement concerning his exile, Spanish authorities paid him several hundred thousand pesos, which he promptly used to buy weapons to continue the rebellion. When the United States declared war against Spain in 1898 over Cuba, Aguinaldo believed the time had at last come for Philippine independence. He returned to the islands, assuming that American troops would assist the Filipinos in achieving that goal. Though the United States and the Filipino rebels had the Spanish as a common enemy, the United States quickly made it clear that it intended to replace Spain as the colonizing power in the Philippines and refused to recognize Philippine independence.

Aguinaldo and other Filipino nationalists resented and resisted the Americans as much as they did the Spanish. Defying U.S. intentions, they organized a constitutional convention in 1899, created a government, and named Aguinaldo president of the new Philippine Republic. When the United States refused to recognize these actions, Aguinaldo declared war against the American troops on the islands. The Philippines Insurrection, as it was known in the United States, began in February 1899 and continued until July 1902, even though Aguinaldo was captured in 1901 and subsequently swore allegiance to the United States. At the height of this conflict, Filipino nationalists faced some 70,000 U.S. soldiers. When the fighting ended, about 4,200 Americans

were dead, as well as 20,000 Filipino soldiers, and no less than 100,000 civilians.

Despite the ongoing military conflict in the Philippines and divided American opinion at home about retaining control of the islands, the U.S. government began to lay the foundations of its colonial administration. President William McKinley appointed the First Philippine Commission in January 1899, tasked with investigating conditions on the islands and making recommendations to Congress about their administration. The Second Philippine Commission, headed by William Howard Taft, began its work the following year to establish the transition from military rule to civilian government. Taft served as the first American civil governor (the title was later changed to governor-general) of the Philippines from 1901 through 1903, and during that time, the commission set up a judicial system, a legal code, and a civil service. The Philippine Bill of 1902 established an elective representative government in the Philippines, modeled on the United States. From 1901 until 1935, when the Philippines gained commonwealth status, the U.S. Bureau of Insular Affairs oversaw colonial matters.

The United States established two Filipino military forces to keep the peace on the islands. Organized in 1899, the Philippine Scouts became part of the U.S. military (the Philippine Division) after World War I. Discontent over unequal pay and benefits prompted some scouts to stage an unsuccessful rebellion in 1924. The Philippine Constabulary was established in 1901 as a national militarized police force under civilian control. The Bureau of Coast Guard and Transportation was created to facilitate the movement of constabulary members and provide additional assistance patrolling the coastal areas. Beginning in 1910, the United States sponsored one Filipino soldier per year for education at West Point, and in 1919, the U.S. Naval Academy at Annapolis enrolled its first Filipino recruit.

Following decades of debates and vague promises, in the 1930s the U.S. government finally committed to a firm timetable for Philippine independence. The islands would spend 10 years as a commonwealth, with a Philippine president and legislature but with the continuing oversight of the United States, including a resident American high commissioner in Manila. When the new Commonwealth government was inaugurated in 1935, the National Defense Act created the Philippine army. President Manuel

Quezon brought in General Douglas MacArthur, retired from the U.S. military, as its field marshal. MacArthur unsuccessfully attempted to create an 11,000-member Philippine army, backed up by 400,000 reserve troops, to deter an anticipated Japanese attack. An offshore patrol, drawn from reserve forces, would constitute the marine division of the army.

After Japan occupied all of French Indochina in July 1941, the United States Army Forces Far East was created, bringing together American and Filipino troops. MacArthur was recalled to active duty in the U.S. military and named major general of this newly formed force, and the U.S. government allotted additional funds for training and weapons. The Japanese onslaught on December 8, 1941, ultimately forced the United States Army Forces Far East's retreat to the Bataan Peninsula and its subsequent surrender. About 54,000 Filipinos endured the Bataan Death March; around 10,000 died. Many of the survivors, gradually paroled by Japanese occupation forces, helped form a guerrilla movement that thwarted the occupation and facilitated MacArthur's 1944 return.

Independence

The Philippines achieved independence in 1946, but its foreign policy and military affairs remained closely tied to the United States. The constabulary, reconstituted at the end of the war, merged with the Military Police Command and was placed under the jurisdiction of the Defense Ministry until its dissolution in 1991. The Scouts disbanded, and those who wished to continue service in the U.S. military were granted U.S. citizenship and transferred to other army units, where they finished their military careers.

The close ties did not always signal a harmonious relationship. In 1946, Philippine politicians, exercising their commitment to national sovereignty, refused to allow U.S. jurisdiction over American soldiers and sailors stationed on the islands. With U.S. Cold War priorities focused on Europe and Japan, the United States relegated the Philippines to a low military priority and announced that it would significantly reduce its troops there and cease the construction of military bases. Fearing the negative effect this would have on the struggling postwar economy and concerned about possible communist

expansion in Asia, in 1947, President Manuel Roxas relented. The United States retained the right to try American military personnel accused of crimes in the Philippines and received authority over Filipinos employed at American bases.

Also that year, the Philippines entered into the Military Bases Agreement, wherein the United States leased 22 military bases on the islands for 99 years. Many Filipinos resented the strict terms of the leases, and the agreement was modified over the years, including a reduction in 1966 from 99 to 25 years. In addition to the bases, American military personnel, as part of the Joint U.S. Military Advisory Group, provided advice on tactics and operations. In 1950, the AFP was created, composed of four major branches: the army, the air force, the navy, and the constabulary (later dropped for the marines). Military appointments, promotions, and the national defense budget all required approval by the Philippines Congress. In 1951, while the Korean War was still going on, the Philippines and the United States signed the Mutual Defense Treaty.

From 1946 to 1954, the AFP combated the communist-inspired *Hukbalahap* rebellion in central Luzon. Ironically, the violence of the Hukbalahap soldiers prompted the United States to reprioritize its interest in the security and stability of the Philippines, as any communist threat anywhere had to be contained. By 1952, President Ramon Magsaysay had almost doubled the size of the Philippine army, to 56,000; he emphasized the use of mobile battalions and boosted morale by rewarding accomplishments and firing or demoting incompetents. The AFP also played a role in international military affairs. In August 1950, 7,500 troops went to Korea as the Philippine Expeditionary Forces. In 1964, 16 army officers were assigned to South Vietnam as advisors on psychological warfare and civil affairs. The Philippine Civic Action Group deployed army engineers and army medical personnel to Vietnam in 1965.

Martial Law and the End of the Cold War

In 1972, President Ferdinand Marcos, with support from the military, declared martial law in order to extend his presidency beyond its two-term limit. After his election in 1965, he rolled back the improved professionalization of the AFP, politicizing the military by making advancement contingent

on a soldier's regional background and on loyalty to him. Between 1972 and 1981, when he lifted the decree, Marcos tripled the size of the armed forces, to about 200,000. The AFP supported the Marcos regime by fighting back challenges from the New People's Army, the military branch of the Communist Party of the Philippines, and the Moro National Liberation Front.

By the 1980s, it was clear that the AFP believed it had the right to determine the legitimacy of the civilian government; in 1986, a faction of the military helped put Marcos's challenger, Corazon Aquino, in office. A series of reforms instituted since then have attempted to restore apolitical professionalism in the AFP. A new constitution drawn up in 1987 designated the president as the commander in chief of the armed forces. After an unsuccessful coup against Aquino in 1989, mutiny and coup d'état became military and civil criminal offenses. In 2003, President Gloria Macapagal Arroyo created the Office of the Presidential Adviser to Implement the Feliciano Commission Recommendations to try to further reform the military.

The end of the 1980s also saw an end to the Cold War, which renewed debates over the continued U.S. military presence on the islands. With the Military Bases Agreement due to expire in 1991, President Corazon Aquino attempted to negotiate an extension of the leases. The United States and the Philippines reached such an agreement in the Treaty of Friendship, Peace, and Cooperation, but the Philippine Senate refused to ratify it. The debate over the treaty was exacerbated by U.S. refusal to specify if it stored nuclear weapons on any of the Philippine bases. Also, the eruption of Mount Pinatubo in 1991 caused significant damage to the naval base at Subic Bay as well as Clark Air Base. Repairs and renovations would have been too costly, and the United States announced plans to dismantle them. Although Aquino worried about the economic effect of the base closings, the Philippine government was disinclined to offer any incentives for the Americans to stay. They were ordered to leave the bases by the end of 1992.

Since the 1990s, the AFP has actively participated in international and domestic efforts to fight terrorism, operations that have increased since the al Qaeda attack on the United States in 2001. From 1990 to 1991, approximately 200 AFP medical personnel assisted coalition forces to liberate Kuwait,

and in 2003, 60 medics, engineers, and other troops participated in the Iraqi invasion. The Moro Islamic Liberation Front renounced terrorism in 2003, and since 2008, it has been involved in peace talks with the Philippine government in an attempt to reach an agreement about territorial independence. Beginning in the early 1990s, the AFP has battled Abu Sayyaf, a group of some 400 Islamic separatists based in the southern Philippine Islands, who allegedly have ties to al Qaeda. Since 2003, the AFP's efforts have been supported by about 600 U.S. Special Forces, as well as U.S. satellite and drone technology. In 2006, the AFP launched a major offensive on Jolo Island against Abu Sayyaf and the Jemaah Islamiya, an Indonesia-based al Qaeda group. By 2010, the AFP had captured or killed 200 of the groups' members. A U.S.-backed air strike on Jolo Island in early 2012 claimed the lives of three top-ranking militants. AFP operations against Abu Sayyaf and the Jemaah Islamiya remain ongoing.

Continuing concerns over terrorist activity in the Philippines and worldwide has brought renewed cooperation between the Philippines and the United States. In 2011, the two countries celebrated the 60th anniversary of the Mutual Defense Treaty and engaged in the first Bilateral Strategic Dialogue in Manila. A second round of talks took place in early 2012. Because of China's growing military power and ongoing territorial disputes over the South China Sea, the Philippines agreed to more joint military exercises and training with the United States, to allow more U.S. troops to rotate through the country, and to purchase additional American military supplies.

PHILIPPINES INSURRECTION

The Philippines Insurrection began as a follow-up to the Spanish-American War as the Philippines had been the key Spanish colonial possession in the Pacific Ocean, an area of American interest. The American war with Spain only briefly touched the island group, first at the May 1, 1898, naval Battle of Manila Bay and then in an almost farcical ground battle for control of the city of Manila itself in August, both American victories. However, the fighting in the islands did not end there. Much like in Cuba, the Spanish-American War in the Philippines did not just involve the United States and Spain. A series of native insurgencies against Spanish rule had been active for years and constituted one of the main reasons for the war between the United States and Spain in the first place. In the case of the Philippines, an archipelago consisting of scores of islands peopled by scores of ethnic groups, the insurgency generally fell under ethnic Tagalog leadership, in particular that of Emilio Aguinaldo. Aguinaldo and his followers believed that the Spanish-American War had finally provided the opportunity for self-rule. Because of that expectation, when the William McKinley administration decided to keep the United States in the Philippines with the Treaty of Paris in late 1898, the local insurgency against the Spanish quickly turned against the Americans.

Course of the War

At the outbreak of hostilities, Aguinaldo commanded a fairly large and coherent ground force that controlled most of the islands, especially the key island of Luzon. American ground forces, number-

ing some 20,000 regulars and volunteers, occupied the city of Manila. The fighting began with shots fired on a patrol on February 4, 1899, and most of the action that followed involved a ground campaign, with American forces moving north from the city on the main insurgent army in the Manila-Lingayen Gulf corridor. The Americans, under the command of Major General Elwell Otis, launched a series of conventional assaults on dug-in insurgent positions. Initially, these assaults had a great deal of success, as tactically the Filipinos struggled to concentrate their firepower to hold even strong positions against direct American assaults. However, as the Americans left behind their resource base in Manila, their volunteer enlistments ran out, and they began to feel the effects of the tropical conditions, the offensive slowed down. When the rainy season began in the spring, the American offensive stopped altogether.

Otis came under strong criticism in the American press, and when the rainy season ended in the early fall, he ordered renewed attacks north, along with an assault from the sea at Lingayen Gulf. Caught between the American forces and suffering from internal divisions, Aguinaldo's army fell apart as a conventional force. Aguinaldo himself eluded capture, and he did not give up the fight. Instead, in December 1899, he chose to order his scattered troops to begin using guerrilla tactics to continue the fight, initiating the second, and more protracted, phase of the war. A vocal anti-imperialist movement in the United States gave hope to the insurgents that they could prolong the war, allowing the anti-imperialists to come to power and withdraw Americans from the islands. The 1900 election, pitting the avowed anti-imperialist William Jennings Bryan against McKinley, became a key point in the early part of the war. However, even Bryan's defeat in that election did not end the fight.

The second phase lasted at least until the summer of 1902 and was marked more by its variety of conditions than by any unifying theme. Aguinaldo, who had tenuous control over the whole insurgency to begin with, remained in hiding in the northeastern part of Luzon for most of the war, further fracturing the fight by geography, local population, and insurgent group dynamics and leadership. In some places, the insurgents enjoyed widespread sympathy from the population and could use mountainous or jungle terrain to great advantage. Other areas were

more geographically open or peopled by ethnic groups, such as the Macabebes, who had no use for the insurgents or the Tagalog insurgent leadership. To counter the fractured nature of the insurgency in the islands, the Americans had to respond in kind. Under the command of Major General Arthur MacArthur after May 1900, the Americans divided the Philippines into departments and districts, each with its own commander and unique distribution of units.

That is not to say that the Americans deliberately assigned leaders and forces to areas where they would be most effective, and in fact the American activities entailed a great deal of trial and error, because the Philippines Insurrection became a messy, violent affair. The insurgents adopted classic guerrilla, small-unit ambush tactics, avoiding larger engagements with the American forces. They also used violence and terror to try to cow the population of various localities into providing support for the war against the Americans. The Americans, led by MacArthur, his successor after July 1901, Major General Adna Chaffee, the administration-appointed civilian leadership in the islands under William Howard Taft, and the overall policy guidance from McKinley calling for “benevolent assimilation” of the Philippines, tried to respond with a robust modernization program. Much of the program focused on building schools and infrastructure, and the development of stronger self-governing structures at the local level. That effort had only limited success, and then only in areas where the local conditions overwhelmingly did not favor the insurgent movement. In the areas where the guerrillas proved stronger, the specific department and district commanders had to develop their own techniques for pacification, and oftentimes those techniques simply could not be very benevolent. The Philippines Insurrection thus defied any unified theory of counterinsurgency. In one district, using American troops and Filipino auxiliaries to provide population security would be vital to quelling the guerrillas; in the next, small units of highly mobile scouts, with an extensive intelligence network continually harassing guerrilla units and base areas, proved the key to breaking the resistance.

In the spring of 1901, the Americans achieved one of their greatest single military successes in the war. Brigadier General Frederick Funston, commanding the district northeast of Manila, finally gained

solid intelligence on the location of Aguinaldo in the isolated village of Palanan on the northwest coast of Luzon. Funston devised an elaborate ruse that involved friendly Macabebe scouts pretending to be reinforcements to Aguinaldo and posing a handful of American troops, including Funston himself, as prisoners of the reinforcements. The party landed on the Luzon coastline south of Palanan, went on a harrowing march to the outskirts of Aguinaldo’s base area, and managed to dupe the insurgent leader into letting them into his camp. There they took him prisoner and with uncanny timing made their way back to the coast and a waiting naval vessel for transport back to Manila. In the aftermath, Aguinaldo signed a public surrender, and although he had very little direct leadership of the guerrilla bands operating across the islands, the symbolic gesture helped spur other insurgent leaders to surrender in the months to come.

Even that positive trend did not end the Philippines Insurrection on the whole of Luzon, let alone throughout the archipelago. In September 1901, on the island of Samar, an insurgent force launched a surprise attack and massacred most of an American company in the town of Balangiga. The reprisal campaigns that followed were the most brutal of the war, as one brigade of American troops under Brigadier General Jacob Smith tore through Samar with little concern for distinguishing between hostiles and the civilian population. Brigadier General J. Franklin Bell’s campaign in the southern Luzon province of Batangas was more measured but still visited extensive destruction on the local agriculture. Bell took the further step of gathering the local population into concentration camps, where many died due to the poor living conditions. Coupled with the efforts over the previous 2 years, the harsh measures worked. The major insurgent efforts had been broken, and by July 1902, President Theodore Roosevelt declared that the insurrection had ended.

Postwar Legacy and Continued Conflict

Most accounts of the Philippines Insurrection end in 1902, but it is worth noting that the fighting in the islands did not end that year. The United States still controlled the islands with a civilian government supported by a handful of U.S. Army units and an American-led native constabulary. Most of the fighting involved low-level but persistent guerrilla

attacks by criminal bandits called *ladrones*, occasionally punctuated by larger scale uprisings, particularly in the southern islands populated by the Muslim Moro. At least two of these uprisings led to significant U.S. Army campaigns against the Moros, important both for the officers involved and for the violence they had to use in their operations. In 1906, General Leonard Wood led a campaign that culminated in the Battle of Bud Dajo on Jolo Island. Seven years later, a force led by Brigadier General John J. Pershing nearly retraced Wood's steps, concluding with the Battle of Bud Bagsak. Both battles involved significant civilian casualties, and the need for both campaigns indicated that while the Philippines Insurrection may have formally ended, the fight to pacify the islands continued. It is at least arguable that the insurrection did not really end until the violence significantly dropped off after Pershing's campaign.

Altogether, more than 100,000 Americans served in the Philippines Insurrection, with some 4,000 dying in the 1899–1900 period and a few hundred more in the years that followed. Participation and casualties on the insurgent and civilian sides remains a much more complicated issue. Initially, Aguinaldo's conventional force numbered anywhere from 12,000 to 40,000, but his numbers in the guerrilla portion of the war are even more cloudy. As in any insurgency, the boundaries between the population and the insurgents shifted all the time, so it is difficult to come to any clear numbers for insurgent forces or casualties beyond estimates in the neighborhood of 100,000. At the time of the war, the best estimates place the overall population of the Philippines between 5 and 8 million. As for the number of deaths from causes relating to the war among that population, there are still nothing like definitive numbers. Many accounts mention the number 250,000, but that figure appears to be derived from an early guess, with little empirical foundation. There is no doubt, however, that the violence, famine, and disease of the war years caused horrendous casualties among the natives of the islands.

Casualty figures constitute just one of the many historical debates over the Philippines Insurrection, most of which began during the Spanish-American War. The origins of that war created their own historical controversies, but commentators then and later pretty much agreed that the flashpoint for the conflict was Cuba. The connection between a

war over Cuba and conflict over other Spanish colonial possessions, especially those in the Pacific Ocean, was always much more difficult to explain. At the time, Americans who wanted to fight for the Philippines represented a small but powerful minority who believed that the United States needed to expand its influence to join the ranks of the great powers. For much of the previous century, while the United States had expanded across North America, the other great powers had pursued imperial agendas outside their immediate geographic vicinity, especially in Africa. With the closing of the American frontier, some Americans believed that the best opportunity for continued growth was in the Pacific Ocean. At the outbreak of war with Spain, such Americans had enough influence to see to it that the United States would fight over more than Cuba. Assistant Secretary of the Navy Theodore Roosevelt led the way, and it was largely due to his efforts that an American fleet was in position to fight at Manila Bay in May 1898. The army followed that summer, placing all-important troops on the ground in the Philippines as the United States and Spain negotiated the peace.

Antiwar Opposition and Critical Interpretations

The opposition to American occupation emerged in force during those negotiations. Most of the opponents, who quickly took on the moniker of anti-imperialists, did not have a problem with American power per se. They argued for a particular brand of American exceptionalism, that the United States should not seek greatness on the model of the European imperial powers. In their view, the continental possessions of the United States, protected by two oceans, already ensured American power. Furthermore, ruling another people would have the effect of degrading the principles for which the United States stood. Those in favor of remaining in the Philippines felt that the reality had changed, that without some sort of territorial growth the United States would stagnate while other great powers continued to progress, thus threatening American power and principles in the long term. When it came to the specific case of the Pacific and the Philippines, the expansionists saw power first in naval terms. Given the steam technology of the time, naval power and influence in the Pacific meant coaling and port

facilities. In the negotiations over acquisition of the islands, the McKinley administration at first focused on the major ports on Luzon. Very quickly, the debate shifted to the question of whether control of those ports could be maintained if the rest of Luzon were under Spanish or Filipino control. As the native insurgency had all but taken over the island from the Spanish already, Spanish control was quickly ruled out, but the solution was not as simple as leaving sovereignty in the hands of the Filipinos. Despite some initial indications that Aguinaldo would have his government, the expansionists did not believe that the Filipinos could provide stable governance for Luzon, let alone the entire archipelago. Many Americans argued that decades of Spanish misrule and revolution on the islands, coupled with clear tribal divisions among the Filipino population, meant that any native government would quickly fall apart. The resulting instability would not only threaten American ports on Luzon but would provide a power vacuum into which other powers, particularly Great Britain or Germany, could step and assert control. That reasoning led President McKinley to support the acquisition of Luzon, and the same logic applied to the further step of the acquisition of the entire island group.

In the years that followed, the difficulties of fighting the Philippines Insurrection and the slow and painful withdrawal of European powers from overseas colonies helped lead the United States to give up such imperial adventures, but that did not end the historical debates over the onset of the war. Beginning in the 1930s, but expanding much more in the 1960s, critiques from Marxist-inspired historians on the left began to question American power and exceptionalism directly. Such works argued that the United States was as subject as any other power to the rapacious materialistic demands of capitalism and that security and ideology were excuses to cover those real demands. Since the 1960s, scholars have shifted perspective, emphasizing the cultural aspects of the American acquisition of the Philippines. Two such views stand out. One makes the case for race as the driving factor: White Anglo-Saxon Protestant Americans saw the Filipinos, among others, as racially inferior and therefore incapable of self-governance. It became the duty of superior races to govern the inferior ones, a view that only gained urgency as the “superior” race saw their positions at home threatened by increased immigration from southern

and eastern Europe and Asia during the same years. The other cultural view highlights the role of gender in expansion by noting the perceived links in the turn-of-the-century era between manhood and a strenuous life, with adventure and war in far-off lands as the greatest indicator of living such a life. The Philippines provided such an opportunity at just the right time, and so American men seized the chance.

There may be no consensus on the exact origins of the war, and it is unlikely that any one of these interpretations stands on its own. Some sort of combination of the ideological, security, material, and cultural factors provides a solid foundation for grasping the complexity behind the American decision to occupy the islands. On the other side, an understanding of the decision of the insurgents to fight the Americans, and especially of the decision of other Filipinos to remain neutral or ally with the Americans, is developing but is generally overshadowed by literature that emphasizes the war as an event indicating the emergence of Filipino nationalism.

Conduct of the War

The other major debates over the Philippines Insurrection have revolved around the American conduct of the war, especially as that conduct relates to the commission of atrocities. At the time of the war, anti-imperialists seized on reports of American misconduct to question the whole endeavor and make the case for withdrawal. Throughout the fighting, especially as the guerrilla portion of the war dragged on, some American soldiers and officers committed theft, destruction of towns, the killing of civilians, the torture of prisoners, and the summary execution of captured insurgents. The accusations led to denials, investigations, courts-martial, and public hearings. At the time some reports were confirmed and more were found false, but that did not end the issue. Historical works, especially during and after the Vietnam War, depicted atrocities as common behavior among American troops in war. Activities that were considered technically legal at the time came under critique. As in their interpretations of the origins of the war, scholars who focus on culture have especially emphasized racial motivations for the atrocities, with White (and sometimes Black) American troops driven by the belief that

Asian natives were lesser humans or less than human. Other works have sought to rehabilitate the American soldier in the war, acknowledging some atrocities but trying to place the blame on either the individuals responsible or the nature of such guerrilla wars themselves.

In recent years, historical interpretations from within the contemporary military have sought to find the lessons learned from the American counterinsurgency in the war. Most have emphasized that the U.S. Army did not want to fight such wars, so it ignored the lessons, only to have to relearn them in places such as Vietnam, Iraq, and Afghanistan. More nuanced views have looked closer at the Philippines Insurrection and found that the lessons were not so simple. As purely war-winning measures, some of the harsher techniques employed by the Americans also proved to be the most effective. But the attendant controversies over such measures threatened American public will at home to keep up the fight. Current U.S. Army doctrine does not believe that such measures prove effective in the long run, in part because they undermine public support, but more because of a conviction that population security is more productive than the use of force in a counterinsurgency. To soldiers who hold such a belief, some of the very lessons to be learned from a few of the localities in the Philippines do not match their belief of what works in a contemporary counterinsurgency; therefore, such lessons only confuse matters.

The complexity of the issues involved means that the controversies over the Philippines Insurrection are ongoing, and the war remains a vital area of study in the field of military science.

PHOTOGRAPHY, COMBAT

Combat photography is a wartime documentation method designed to capture close and personal images of soldiers engaged in warfare. These images document battle scenes, the aftermath of combat, and the lives of soldiers in the war zone. This entry discusses the history of combat photography, examining how evolving technologies and the advent of the Internet affected the way war is documented.

Early History

The roots of combat photography trace back to the mid-1800s, when an anonymous photographer took

a series of daguerreotypes (an early form of photographs) to document the Mexican-American War.

Early on, the technological limitations of bulky, slow photographic equipment meant that photographers were unable to capture moving images and, instead, would take still images of the battlefield after fighting had ceased. Original combat photographs highlighted the bloodshed and loss of life that followed epic battles such as Gettysburg and Antietam during the American Civil War. Many viewers of these early photographs questioned their authenticity, believing the new technology to be artistic creations akin to paintings.

While photography advanced beyond the public's understanding of it, some early images from this period do appear to be staged due to either the photographer's interference or manipulation of subject matter over simple image captures. Photographers, often employed by well-known photographers like Matthew Brady, were sent off on horseback with their bulky equipment to capture images of the battlefields once the battles ended. The photographers' work produced images of war that were sometimes created by moving corpses or standing in for soldiers and officers. Intentional manipulation of the film and negatives emerged well after the war, as technologies improved near the turn of the century, aiming to erase the mechanical look of photos that baffled the public. Despite primitive manipulation on the part of the photographer, even staged photos from the Civil War battlefields capture life, death, and the landscape of the war in such a way that can only be replicated but never wholly repeated.

In the decades following the Civil War, camera technology evolved tremendously from expensive, cumbersome machines with long production times to compact digital devices capable of photographing and videotaping discretely, with instantaneous results and playback. By the late 1800s, the U.S. Army began recognizing the value of combat photography, training soldiers to use cameras, publishing an instruction manual, and opening a lab for processing and development of images. By the early 1900s, camera technology advanced to include motion picture, land, and aerial photography. However, in spite of these advancements, the equipment remained cumbersome and difficult to maneuver, in effect continuing to keep cameras off active battlefields. Even so, technological advances made images starkly realistic, able to showcase the

extremes of warfare, and as the physical limitations of equipment disappeared, combat photography became part of embedded journalism, giving civilians an honest look at soldiers' lives.

Combat photography has been present in every war since the 1840s and over time has become an integral part of telling the war story, from daily activities such as meals and roll call to heavy battles on land or sea and in the air. In spite of the significance of combat photography, no accepted legal, ethical, or widespread publication standards exist, and images can be subject to controversy specific to each war. A continually advancing form of media, combat photography is responsible for some of the most definitive investigation and reporting of wartime conditions, in addition to producing a number of iconic images.

World War I, World II, Korea, and Vietnam

While the roots of combat photography reach back to the 1800s, it was not until the First and Second World Wars that combat photographers began to document actual battles. By the time the United States entered the First World War, the military had developed what would be known as the Photographic Division, employing some 600 soldiers by 1918. However, these photographers were often stymied by their equipment and could not always capture the unfolding battles for safety reasons. In addition to safety concerns, the government began to censor combat photographs, typically highlighting soldiers marching, generals convening, ships sailing, and clean hospital scenes.

It was not until the Second World War that a number of notable combat photographs entered the public consciousness via newspapers, popular magazines, and wartime propaganda, giving citizens a look at the gritty reality of war. One recognizable example is that of the U.S. Marines raising the American flag over Iwo Jima in 1945, which has been reproduced and replicated thousands of times, even serving as inspiration for a physical memorial in Washington, D.C. Still, government censorship played a huge role in controlling the war narrative. President Franklin D. Roosevelt established the Office of Censorship to monitor any and all photographs and press coverage. As the war went on, the government began to release more combat photographs to help the public see and understand the war, even showing images of U.S. soldiers suffering.

Following the Second World War, combat photography evolved rapidly with the integration of journalists and photographers into physical combat units, creating the field of embedded journalism. During the Korean and Vietnam Wars combat photography became far more explicit, moving away from the stirring, patriotic images of previous wars to a more realistic and, oftentimes, disturbing portrayal of combat. With journalists and photographers following combat units, the images provided a first-hand account. Photographs began to appear weekly, via news organizations such as the Associated Press and publications such as *Life* magazine, of injured soldiers and civilians, burning villages, dead bodies, massacres, and the like.

On the home front, still photographs coupled with nightly news coverage caused various forms of controversy since the majority of citizens had never witnessed the carnage and suffering of war on the front page of the newspaper and were uncertain how to react. Body counts were given, commentary narrated the images, and the media became an influencing factor. Notably, the most infamous combat photographs from Vietnam included the Pulitzer Prize-winning image of General Nguyen Ngoc Loan executing Viet Cong officer and prisoner Nguyen Van Lem in the street during the 1968 Tet Offensive and 9-year-old Kim Phuc running naked down the street after being doused with napalm in 1972. As a result, combat images began to raise moral and ethical questions previously undiscussed by the media, a trend that persisted well into the 21st century.

While World War I remained hard to capture, World War II became the first to be heavily documented. The Vietnam War, and the Korean War to an extent, began to break the patterns set by the preceding wars as combat photographers took to the front lines, taking photos of the action as it unfolded, including deployment, injuries, and atrocities. Though Vietnam War photographers still relied on traditional development techniques, the images sent home were broadcast and rebroadcast across television and print media channels. Images from the Vietnam War still persist, in large part because of digitization and online archiving.

First Gulf War

After the Vietnam War, the techniques and methods of combat photography were reviewed and

updated within the field and in scholarly literature. Controversial images were examined as camera technology continued to evolve and photography became part of the push toward online documentation versus the limitations of print media. Even some 15 years after the Vietnam War ended, the images were still visible in the war's historical memory.

During the First Gulf War, sometimes referred to as the Persian Gulf War, combat photography became less of a media presence than in previous involvements. Photographers documented carbonized bodies and the widespread physical destruction of homes and structures resulting from air strikes and bombing. Combat photographs covered areas such as the Highway of Death between Kuwait and Iraq, which saw heavy battle during the final days of the war.

However, a government consensus within the administration of George H. W. Bush ruled that such images should remain out of the public eye and it moved to completely ban the publication of soldiers' coffins. This ban meant that photographers were not allowed to shoot at military funerals in Arlington National Cemetery or on military bases such as the Dover Air Force Base, which was responsible for receiving the returning coffins. As a result, much of the combat photography from the First Gulf War remained private until well after the war ended. Only after the beginning of the Second Gulf War and fighting in Afghanistan were a number of these photos released and are now accessible online and in archives.

Post-9/11 Status

In the wake of the attacks of September 11, 2001, the combat photograph was once again reconsidered as the United States reeled from the terror attacks and entered into involvements in both Afghanistan and Iraq. The country was inundated with disturbing photos of the World Trade Center and Pentagon, and there was a general sentiment that combat photography should be kept clean and focused on patriotic, inspiring images. The issue was even analyzed by the Pentagon, which studied different forms of combat photography and, ultimately, opted to lift the Gulf War-era ban on photos of soldiers' coffins in 2009.

Additionally, those photographers embedding in Afghanistan and Iraq were required to sign contracts

that ensured that each photographer would not divulge any information that would endanger a unit's position, future movements, weapons, or any additional movement. In effect, these contracts acted as restrictions on the combat photography produced and its subsequent publication.

Despite rapid advances in the technology of combat photography, the subject matter saw a slow series of evolutions. In the first few years after 9/11, a number of newspapers refused to publish disturbing images, given the atmosphere in the country, which was still healing from the attacks. Self-censorship permeated the photography world, and some newspapers even toned down coverage to avoid offending readers, omitting descriptions of battles, injuries, and soldier deaths. However, as the wars progressed, this sentiment began to fade around 2005, making images more readily available.

Within a few years of 9/11, many news outlets began reporting an increase of disturbing images, the result of continued fighting and changing technology. Notably, a number of extremely disturbing photographs that pushed the boundaries of previous controversial photographs were published, including images of prisoner abuse, the beheading of an American civilian, and the dead bodies of Uday and Quasay Hussein, sons of the ousted Iraqi leader Saddam Hussein. Similarly, other controversies arose over embedded media disclosing confidential locations and information vital to the war and leading some to question the authenticity of certain images.

The Digital Age

As digital photography became the standard of combat documentation, newer cameras allowed photographers to see their images immediately after capture. Digital photography made photo manipulation and distribution far easier, giving embedded photojournalists the ability to send photos to their editors almost instantly after upload, even from the battlefield. Coupled with the rise of the Internet, combat photography went viral and entered private homes via web searches and online news stories.

Combat photography websites and blogs began to appear where site visitors could browse images at their own discretion, following a possible disclaimer. With the advent of websites, such as YouTube and WikiLeaks, combat photography and graphic images began to permeate the Internet as soldiers

with cell phones began to assume the role of amateur combat photographers.

As a result of soldiers producing their own images, military branches moved to regulate combat photography to prevent the spread of manipulated or disturbing images of both soldiers and the enemy. The Department of Defense now offers military photography workshops to interested enlisted men and women. There is also an annual award series given out by the military in the categories of Photographer of the Year, Videographer of the Year, Portrait, Pictorial, and Combat Camera among others. At present, it seems the military has responded to the inevitable involvement of soldiers as photographers by adapting to the trend rather than denouncing it.

Modern State of Combat Photography

Due to the spread of digital and online technologies, combat photography entered into a period of flux. After 9/11, the majority of combat photographers were considered to be embedded, or traveling with military units. In addition to embedded photographers, there were a number of unembedded combat photographers who acted as rogue documenters of the war. And finally, there are the soldiers who document their missions and actions through whatever means of technology they carry on their person.

Typically, the embedded and unembedded combat photographers are professionals, who travel with long-range lens, multiple cameras, and equipment that will ensure quality photography of whatever subject matter they encounter. However, the soldier variety of combat photographer usually relies on cell phone cameras or small digital cameras that produce grainy stills and short video clips. Still, the quality of the image has proven to be less important than the subject matter when it comes to what global news organizations choose to publish. Controversial or enlightening photos are often published above the more traditionally based battle scenes because of the raw, realistic quality these images provide viewers.

Without legal regulation and with the aid of the Internet, combat photography continues to change and is currently headed toward a freer format. In place of the classic combat photography nomenclature, the style is now often referred to as war or military photography.

PHYSICAL FITNESS

Physical fitness has always been a key element in winning ground on the battlefield. As the battlefield has evolved, tactics have as well; in modern situations, soldiers carry multiple weapons and ammunition. Soldiers must maintain their physical fitness if they want to remain lethal over the duration of a patrol or battle. Soldiers must be able to move quickly over a long period of time, while carrying their ammo, weapons, and any other supplies they may need to sustain themselves. This can push an individual's physical stamina to the limits and, at the same time, requires the soldier to stay mentally alert for possible threats. Being exposed to the stress of a battlefield can create physical fatigue and mental sluggishness; hence, maintaining one's physical fitness is vital to success on the battlefield.

History and Background

Most armies throughout history have used some sort of systematic physical training to prepare their troops for battle. Although much of this training focused on specific military skills—swordsmanship, horseback riding, and so on—training for general strength and endurance was also an important part of the regime. According to Vegetius, soldiers in the Roman army were specifically trained to be able to cover long distances by foot, marching up to 20 miles in 5 hours.

For armies less professionalized than the Romans, sports and other games were an important way to measure fitness and to improve it. Among the non-Spartan Greeks, for example, athletes trained in the events of the ancient pentathlon—running, long jump, javelin throw, discus throw, and wrestling—which were thought to be directly related to battlefield performance. However, in eras where even normal civilian life was physically demanding, training for strength and endurance probably was not as important as in the modern era. Systematic physical training became increasingly important in the modern era as scientific methods of measuring fitness became available and as everyday life became increasingly sedentary. Many advances in military physical training—and even in the realm of civilian fitness—have been motivated by the need to maintain a stream of recruits fit for military duty.

In general, physical fitness in military organizations is attained through a process of selection for basic physical health and through training to a standard of fitness. Candidates for military induction are put through extensive medical examinations to ensure that they are healthy enough to endure the rigors of military service. After joining the service, they are generally put through a demanding course of physical training, including calisthenics and extensive running, to develop the key components of physical fitness to military standards. Those in combat arms units, those who perform more specialized jobs, and those who belong to more selective units (e.g., paratroopers or special operations units) typically undergo an even more exacting training and selection process.

Key Components of Physical Fitness

The American military defines physical fitness as the performance of demanding physical tasks, the maintenance of physical health, and the maintenance of personal appearance. Differences between civilian and military physical fitness standards generally reflect each group's individual goals. While civilian physical training may be focused on cosmetic goals or promoting longevity and is largely optional, physical training is mandatory for the entire military population and is fundamentally aimed at success on the battlefield. Widely recognized components of physical readiness include aerobic fitness, muscle strength, muscular endurance, flexibility, speed and agility,

and the skills necessary to complete specialized tasks such as swimming, mountaineering, or cross-country marching. Physical fitness in the military, then, is maintained through a combination of systematic training and measurement to ensure that servicewide and specialized standards are met and maintained.

Origins of American Military Physical Fitness

The U.S. military's interest in physical fitness originated with the creation of the Department of Physical Education at the United States Military Academy (USMA), West Point, New York, in 1814. Pierre Thomas, a fencing instructor, was the first full-time physical educator at a higher education institution in the United States. The creation of the Cadet Physical Fitness Test (CPFT) represents the first concerted effort to promote physical fitness among USMA cadets. Thomas had the support of Superintendent Alden Partridge, who worked to secure the USMA Board of Visitors' support for physical training. In 1826, the Board of Visitors reported that physical education was crucial for a military officer. Between the years 1815 and 1885, military physical education consisted of sword exercises, military drills, and an earlier version of football. The key goals of these three exercises were to strengthen the cadets' bodies, stimulate ambition, prevent idleness, and keep minds sharp.

Herman J. Koehler's assumption of control over the physical education program at West Point in 1885 brought about the expansion of the military cadet exercises with the inclusion of calisthenics, swimming, gymnastics, boxing, wrestling, and bayonet exercises. Following Koehler's efforts, the U.S. Army, with its entry into World War I, would adapt these training exercises as the basis of its field training manuals. CPFT training exercises remained the same until they were revised in 1923. In that year, Koehler established the first standards of evaluation for cadets. With Koehler's standards, a cadet would be measured in seven strength areas, including body measurements and the administering of a 10-minute breaststroke swim test. The use of an outdoor track was introduced in 1927 to test cadets' endurance and stamina. Between 1936 and 1943 the USMA experimented with many new versions of the physical fitness test.

World War II brought great changes to the CPFT. The year 1944 witnessed the first dismissal

of a cadet from one of the military academies due to his lack of physical ability. A grading system was introduced in 1946, which included a physical efficiency grade based on a cadet's physical ability. Following the Service Academies' admission of women in 1976, female cadets took part in the PFT, which continued to adhere to high standards. By this time, however, many doubted the physical ability of U.S. troops. Most notably, President Jimmy Carter noted that the U.S. military fitness level lagged behind that of Mexico. This brought about more drastic changes to the Army Physical Fitness Test (APFT). Secretary of Defense Harold Brown was designated to redesign a physical standards test for the military to measure each U.S. soldier's fitness level. Brown formed a committee in 1980 to create an all-U.S. military fitness test for future soldiers. Representatives from the army and the Marine Corps, civilian educators, and members of the Army Fitness School created a physical fitness test that focused on three areas of a soldier's physical fitness: (1) aerobic capacity (a 2-mile run), (2) upper-body strength (push-ups and pull-ups), and (3) abdominal strength and endurance. These new testing strategies benefited the army by increasing the efficiency by which the physical fitness of soldiers was assessed as well as by highlighting areas for improvement. These tests became standard across the military in 1981.

The USMA also adopted these new APFT standards in 1981. These tests were administered to cadets, requiring them to perform the actions in combat boots and fatigue pants. Cadets generally scored well based on the military scoring standards, with most receiving B+ grades. Continued efforts to improve soldiers' fitness, however, pushed the academy to revamp its assessment scores and require a minimum score of 201 out of 300 points to receive a passing grade, with each event worth a total of 100 points. The year 1985 brought about new testing standards for cadets, and uniforms were changed to include shirts and athletic shorts. Seeking to emphasize the importance of measuring the fitness levels of cadets, in 1987 the army changed the name of the physical fitness test from Army Physical Readiness Test to Army Physical Fitness Test. The grading scale was again revised, increasing the standard 100-point army score per event to 125 points per event. Once the change in grading scale was complete, the name was changed from APFT back to CPFT. Testing

standards have varied only slightly during the past 20 years.

Testing Fitness Standards in the Contemporary U.S. Armed Forces

The basic tests for physical fitness in the U.S. armed forces measure upper-body strength, cardiovascular strength, and core strength. In the army, navy, and air force, upper-body strength is measured by the maximum number of push-ups performed in a 2-minute period, and in the Marine Corps, it is measured by the maximum number of pull-ups. Aerobic endurance is measured through timed runs (2 miles in the army, navy, and air force and 3 miles in the Marines), and core strength is measured by the maximum number of sit-ups or crunches in a 2-minute period. Infantry units, paratroopers, and special operations forces have more stringent standards. The physical fitness test for U.S. Army Rangers, for example, also measures pull-ups, a 5-mile run, a timed 16-mile hike with a heavy load, and a relatively short swim with combat gear. U.S. Navy SEALs test swimming extensively, both for speed and for distance. In recent years, the U.S. military has begun to emphasize other physical capabilities, such as speed and agility, in an attempt to make the measurement of physical fitness more relevant to the demands of the battlefield. In 2008, the U.S. Marine Corps adopted a new combat fitness test that emphasized short-distance running, agility, and functional tests of upper-body strength; a similar test is under development for the U.S. Army.

Training Methods

The training methods employed in the armed forces are not markedly dissimilar to those employed in the civilian world. In fact, the basic principles—muscular overload, endurance, and skills training—are often very similar. However, the armed forces work under constraints of budget, time, and space. With large numbers of personnel to train, much of the military physical fitness program focuses on exercises that do not require expensive specialized equipment. Although gyms and swimming pools are provided for American military personnel to exercise in their leisure time, military fitness programs tend to emphasize push-ups, pull-ups, other callisthenic exercises, and running. These are often done in unison in a group setting, thereby offering the military

additional opportunities to enhance unit cohesion and identity. In addition, military units—especially basic training units—often emphasize runs in formation and other group activities. Finally, recruits and other military personnel are put through obstacle courses to develop complex motor skills and agility, which are useful in the unpredictable terrain of the battlefield.

The Army Physical Readiness Test

Today's U.S. Army infantry troops are more physically fit than Special Forces troops from the Vietnam era; the Army is also engaged in an ongoing effort to update the APFT to reflect the physical demands of diverse combat environments and other contemporary duties. As of late 2012, implementation of a new version of the test—to be called the Army Physical Readiness Test (APRT)—was on hold while army officials determined how best to measure soldiers' fitness and ability. There had been talk of incorporating the Army Combat Readiness Test (ACRT) into the training regimen, but at present, this has not come to fruition. The army plans to continue using the APFT pending a study of how best to measure soldiers' baseline physical readiness.

Current Issues

As epidemic levels of obesity become more common in Western countries, physical fitness standards and training are receiving increasing emphasis in the U.S. military. Weight control standards are becoming more prominent, and military organizations are providing counseling and exercise facilities in an effort to maintain standards. Women's increasing presence in the military also raises questions about the proper way to assess and promote physical fitness. At present, all military branches have separate physical standards and tests for servicemen and servicewomen, which continue to evolve in parallel. As more women enter the armed forces, however, issues of physical difference continue to be highlighted, especially with regard to women serving in combat zones. Additionally, fitness standards are continuing to evolve to reflect the functional requirements of the battlefield and to incorporate recent developments in civilian physical fitness. All of these issues suggest that military physical fitness continues to evolve in a dynamic environment as all the services strive to put

the best trained, fittest, and best equipped servicemen and servicewomen in the field.

PIRACY, HIGH SEAS

Piracy is a global concern, particularly in the busy waterways around the Gulf of Aden near the Horn of Africa. Since 2003, pirate encounters have rapidly escalated and have been reported off the coasts of Bangladesh, Nigeria, Brazil, Peru, and Singapore, as well as other coasts around the world. In 2009, there were reports of attacks off the coast of Haiti and Columbia in which coastal tankers were hijacked. Even though piracy does not affect a large number of ships, the frequency of attacks has increased significantly. Piracy is a problem that benefits not only the criminal activities in the country where the pirates originate or work out of but other nations as well. Piracy promotes lawlessness and instability and supplies criminals as well as terrorists with the means of continuing the crimes they commit through the trading of illegally obtained materials. This entry describes the routes and type of ships targeted, the procedures of pirates, and the actions being taken to protect shipping lanes from pirates.

While piracy is not yet a direct threat to the vital national interests of the United States, criminal activities on the high seas, especially around Africa, do affect American interests in the region and the freedom of the seas, where 80% of global commerce takes place. An increasingly important component of the global economy is maritime commerce, and it is defined by large, containerized shipping, moving through mega ports, forming the major component of just-in-time international trade. Other types of ships that are usually targeted include trawler vessels, vessels with chemical products, general-cargo ships, bulk carriers, and sometimes tug boats or barges. Yachts and ferries are very rarely attacked.

An example of important trade materials that pass through mega ports via ships are the barrels of oil exported from West Africa. Ten percent of the goods crossing the high seas near African coasts are oil. West African oil will be a large part of imported oil in the United States by 2015. In all, 25% of the oil in the United States will come from West Africa, and as of 2010, countries in the region around the

Gulf of Guinea had lost approximately \$1 billion in oil annually due to piracy. In turn, this will, and has, affected the world oil market prices.

The amount of piracy taking place around the world is a major factor when shipping companies consider shipping routes, particularly around the Gulf of Aden, covering a width of 300 miles and flowing 920 miles between Somalia, Yemen, and Djibouti, overall covering 205,000 square miles. This is a key shipping route of the Suez Canal, linking the West with Asia. Using shorter alternative routes because of fear of pirates scouting in the Suez Canal decreases the time, energy, and cost of shipping. Because of this, more than 20,000 ships pass through the Gulf of Aden each year, as it takes 2,700 miles off a cargo ship's alternative voyage, which is around the tip of Africa. If a shipping company is forced to take the route around the tip of Africa due to the threat of pirates, this can add to the fuel

costs of transporting cargo. Such increase in the cost of fuel adds up to around \$3.5 million annually, and additional costs in charter expenses can be as much as \$14.6 million. This, as well as the dangerous navigation through winter waters at the tip of Africa, is another concern for shipping companies and ultimately disrupts the supply chain.

While pirate activity has been reported all over the world, many of the Suez Canal and Indian Ocean pirates operate out of the failed state of Somalia. Since March 1995, when the United Nations pulled out, the country has lacked a central government that is recognized as legitimate by the Somali people, and the lawlessness continues, with pirates playing a key role. Most of the major pirate bases of concern are in Somalia, principally in Eyl, which is in the northeastern Puntland region. There is also activity in Xarardheere, in the central part of the country. However, due to the increase in UN-authorized

Members of the visit, board, search, and seizure team and U.S. Coast Guard Maritime Safety and Security Team 91104 enter a rigid hull inflatable boat from guided-missile cruiser USS *Anzio* (CG 68) before boarding a skiff containing suspected pirates on September 1, 2009, in the Gulf of Aden. *Anzio* is the flagship of Combined Task Force 151, a multinational task force established to conduct counterpiracy operations off the coast of Somalia.

Source: U.S. Navy photo by Mass Communication Specialist 2nd Class Brian K. Fromal (released).

naval activity by the United States, Europe, and Asia in the region, which is used to help protect foreign interests, pirates have worked around these increased security measures. For instance, while international shipping companies and fleets began to move away from the coasts of Somalia in the Indian Ocean, pirates moved north to the Gulf of Aden and can be found as far south as the Mozambique Channel and the Seychelles, as well as east toward India. There are an estimated 1,000 armed pirates, comprising former militiamen and fishermen working in these waters.

The criminal activities in the Horn of Africa are of major concern in that pirates aid the lawlessness and enterprises of the criminals. In turn, this empowers extremist groups such as the Harakat al-Shabab network, which is an al Qaeda-linked Islamist militant group. Al-Shabab benefits from the pirate activities in numerous ways. Pirates are used to smuggle goods and weapons from various ports to Somalia, making it a port of entry for foreign fighters. There are documented cases where pirates transported the foreign fighters into Africa and terrorists out, including the individuals responsible for the March 2009 bombing in Yemen. In turn, pirates are allowed to operate in the areas controlled by the Islamist groups. Pirates pay their suppliers through the profits made off hijacked and pilfered ships. Additionally, not only are pirates used as a way to transport potential terrorists and criminals, but also the cargo pilfered from hijacked ships may contain weapons, drugs, or other potentially useful materials that could ultimately find their way to the terrorist organizations.

The primary goal of pirates is to make money. This is achieved through the robbing of a ship's crew and the pilfering of cargo, but a lot of the money made by pirates also comes from kidnapping crewmembers and demanding ransom from the shipping companies. The amount of ransom a pirate can get is about \$1 million to \$2 million per ship. In 2008, \$30 million was the minimum obtained from pirate activity, in addition to other crimes such as smuggling. In 2009, 214 ships were attacked by pirates and 47 seized. From those ships, 867 people were taken hostage, possibly doubling the \$30 million made in 2008. In addition to this \$30 million, it was reported that 4 mariners were killed and another 14 presumed dead or missing. Even though kidnapping and sometimes fatalities occur, it is only rarely that the crew of a hijacked ship is harmed.

Pirates usually have a network of depots established along coasts, which not only allows them to sell their goods, rearm, and resupply their ships but also allows them the opportunity to contact spies who may be working for them in the area, gathering vital information about the ships that may be passing through. Profits from hijacked cargo are dispersed to the pirate suppliers, organizers, and investors who support the pirates during their time on the sea. Profits also benefit those in their clan, which includes family and friends. The money made from pirating serves as a significant means of income for not only the criminals who supply the pirates but also the thousands of people in the country in general. In addition to the dispersal of the profits among suppliers, friends, and family, they also go toward upgrading vessels and weapons used to hijack ships, strengthening and helping pirate activity grow.

Pirates go to sea in their "mother ship," which is usually a fishing vessel that is first hijacked and then used as a scouting ship. These ships will last longer at sea than the skiffs used to find a potential mother vessel. Once a passing cargo ship has been spotted, the mother ship deploys two to four smaller high-speed vessels that flank the target. To slow or stop the ship, pirates use various means of intimidation, which include firing automatic weapons and rocket-propelled grenades. Once the target has slowed, a team of 7–10 pirates uses ladders and grappling hooks to climb aboard, taking the ship and its crew hostage. The team of pirates is usually armed, and the low number of crewmen (usually no more than a dozen) aids in the easy hijacking of a ship.

The International Maritime Bureau of the International Chamber of Commerce reports that in 2004 there were 38 recorded pirate attacks in the Strait of Malacca. In 2008, there were only two. This is an example of the public-private cooperation with the Regional Cooperation Agreement on Combating Piracy and Armed Robbery Against Ships in Asia and is credited with reducing sea crime in that region. Sixteen nations participate in this regional cooperation.

The United States, in partnership with other countries, takes action in protecting shipping lanes in areas of high traffic. Recently, North Atlantic Treaty Organization ships have been replaced by a European Union task force, in addition to U.S. naval forces, to create a multinational antipiracy effort known as Combined Task Force 151. Other nations

that are participating in operations include Great Britain, Greece, Italy, Germany, France, Denmark, Turkey, Russia, Pakistan, India, Saudi Arabia, China, and Malaysia, with the Republic of Korea and Japan looking to join the efforts of combating piracy.

Because of the lack of government since the 1980s, and the pirates' network of benefiting supporters and suppliers, Somalia is one of the key countries to look at for stopping pirate activity. Ending piracy in Somalia will help aid in the efforts to end it elsewhere. The increase in the frequency of attacks from Somali pirates shows the need to defeat piracy in and around Africa. A strong central government must be established. In the absence of government, the brazen acts of pirates with regard to human trafficking, drug and arms smuggling, and other criminal activities will not stop. They will continue to serve as an example to other potential pirates or terrorist groups in other countries as ways of preparation and procedure.

PLANS, OPERATIONAL

Operational planning is a means by which commanders conceive of more desirable future conditions and devise a means to attain these conditions. The operational plan is also a tool through which the commander communicates how his or her unit will achieve this more desirable condition. Operational plans act as a guide to military action. In war, planning can also help commanders make the best use of scarce or precious resources. Failure to conduct careful planning may result in a waste of time, money, or the lives of soldiers. This entry discusses the steps

in the planning cycle, characteristics of good operational plans, and changes to planning doctrine in the U.S. Army and Marine Corps.

How and Why Operational Plans Are Created and Utilized

Operational plans may be created to address events, expected future events, or possible contingencies. Such planning may be conducted because of a current or emerging threat. For example, the Germans conducted extensive planning before launching Operation Albion, an amphibious assault on several islands in the Baltic Sea in 1917. Once the operation was under way, however, planning did not stop. The Germans adjusted their plans to meet changing conditions as the battle unfolded. In some cases, planning is conducted during times of peace to address the conditions that may emerge in the future. The planning done by U.S. forces to meet Soviet invaders in Germany's Fulda Gap during the Cold War is but one example.

Military units of all sizes conduct some form of planning before conducting any activity. At the conceptual level, the planning process of each of these units is similar, regardless of size. Each leader, commander, or staff attempts to attain the best possible understanding of the current situation. This understanding, viewed through the lens of the friendly mission, is the basis for determining possible courses of action to achieve the assigned mission in the conditions that prevail. These courses of action are examined and evaluated, and one of them is selected. This course of action is then communicated to those who must put it into action. It is worth noting that this description closely mirrors the OODA (Observe, Orient, Decide, and Act) loop, or decision-making cycle, put forward by the military theorist Colonel John Boyd, U.S. Air Force.

General Planning Cycle

The first step in planning is to determine the nature of the problem. It is critical that the problem is clearly identified. A planner's understanding of the problem plays an important role in determining the approach that will be taken in attempting to solve the problem.

The next step is to develop potential courses of action that will effectively address the problem. These courses of action need not be perfect. In fact,

attempts to devise the “perfect” solution are likely to take up a great deal of valuable time. Even in those rare instances in which time is not a factor, it is unlikely that planners will possess all the information necessary to make a “perfect” decision.

Courses of action are then tested, usually through war gaming, to determine how well they will withstand the shocks likely to be administered by the enemy or by simple chance. Potential courses of action are then compared to determine which one will best meet the requirements of the mission and the desires of the commander. Once a course of action is selected, that course of action must be communicated to subordinates so that they can put it into action.

Characteristics of Good Plans

The true value of planning is to establish an intellectual and conceptual framework within which leaders may conduct operations. Plans should be flexible enough that they will retain some value in spite of the unforeseeable actions that always occur in military activities, whether due to enemy action or the role of chance. When based on a careful appreciation of the enemy’s capabilities and probable intentions, it is likely that some aspects of the plan will still be relevant, even if the enemy acts in an unexpected manner.

The utility of any operational plan should be measured by its effectiveness during execution. One of the most common errors in planning is that plans are often viewed as a “script” for how the battle is intended to unfold. This is a gross error, and planners must curb the natural tendency to be overly prescriptive. There is often an unfortunate tendency to judge the value of a plan by the level of detail included. As a result, plans can become so complex that they are unable to cope with the multiplicity of possible events that the actions of enemy forces and friendly forces may present. Due to the complexity of war, little often goes precisely as planned.

The best plans are usually fairly simple. Even simple plans are challenging to execute due to the entropic force that the historian and theorist Carl von Clausewitz labeled “friction.” A plan that is too complex is likely to fail even before enemy action is encountered, simply due to the effects of friction. In planning, simplicity also extends to the means of communicating the plan to subordinates.

Good plans are models of clear and concise communication. The commander must clearly describe what he or she wishes the operation to achieve. If there is room for misunderstanding or misinterpretation, the commander is ultimately responsible. No more and no less information should be given than is necessary.

Plans should not include unnecessary information, such as recapitulation of doctrine or descriptions of a standard procedure, if it can be found elsewhere and is widely understood. Such unnecessary information does not aid subordinates in understanding the commander’s strategy for accomplishing the mission or the role each subordinate element is expected to play. Such frivolous additions simply obscure the message and may even have the unintended consequence of discouraging subordinates from reading the order.

In addition, to give subordinates the ability to accomplish the mission in a dynamic combat environment, the commander should brief the subordinates about their mission and not dictate the manner in which the mission should be accomplished. Planners and commanders should limit the flexibility of subordinates as little as possible. Good planning creates a framework within which subordinates are able and free to adapt as unforeseen challenges and opportunities arise.

Organization

Plans must be communicated in a logical, coherent manner to those who are responsible for their execution. The method that most modern forces use is known as the “Five Paragraph Order.” The order is preceded by a brief orientation. The orientation provides subordinates with a broader perspective regarding the prevailing conditions that warranted creation of the plan.

The first paragraph is the “situation” paragraph. This refers specifically to the enemy that the force issuing the order must face. The situation paragraph also provides an analysis of the effect that terrain will have on friendly and enemy forces. In a counterinsurgency context, the situation paragraph may also contain information regarding the local population.

The second paragraph is the “mission” paragraph. This contains a brief statement of what the unit is to accomplish. The third paragraph is the “execution” paragraph. It details how the unit will

accomplish the mission and establishes tasks for subordinate units. The next paragraph is the “administration and logistics” paragraph, which details the support that subordinate elements can expect from their higher headquarters. The last paragraph is the “command and signals” paragraph. This describes the means by which command and control will be exercised. Although most operational plans generally adhere to the foregoing organization, format is less important than content and clarity. Plans may also contain numerous annexes and appendices to clarify or provide the necessary detail.

The Role of Planning in Military Decision Making

Good plans play at least three important roles in aiding military decision making. First, good planning provides commanders and staff with an understanding of the possibilities and limitations that the situation offers to both friendly forces and the enemy. Even in the unlikely event that some occurrence renders all the planning products irrelevant, as long as the unit is operating on the same terrain, the time spent in planning will be of value. Second, even if the situation does change and parts of the plan are no longer applicable, some elements may still be useful and will provide the basis for a new plan to be crafted. Third, it is also possible that with enough time and thought, the plan will accurately envision the options open to the enemy commander. In such a case, branch plans and sequels can be created to deal with likely or possible enemy actions (branch plans are plans created to deal with possible enemy actions, while sequels are plans for actions that follow the current operation, based on the likely outcome). These branches and sequels facilitate friendly decisions and allow more rapid friendly actions.

Changes to Planning Doctrine

Both the U.S. Marine Corps and the U.S. Army have introduced changes to their planning doctrine in response to the lessons learned during the wars in Afghanistan and Iraq. Before Iraq and Afghanistan, conventional military operations dominated much of the preparation for future conflict. Planning doctrine largely reflected this mind-set. Little attention was devoted to nonmilitary factors. For instance, previous planning doctrine did not adequately address the requirement to understand the influence of the

local culture and population in military operations. The indigenous population, largely found in urban areas, was to be avoided and battle sought with potential enemies in the open. While it was realized that potential enemies would be able to influence where combat took place, efforts to revise urban warfare doctrine were largely incomplete when the campaigns in Iraq and Afghanistan commenced.

In addition, the complex nature of modern warfare “among the people” required a more holistic approach to problem solving. In many cases, enemy forces may not be the greatest obstacle to mission accomplishment facing friendly forces. Local governance, indigenous security force capacity building, and economic improvements are intractable problems with which military forces may be confronted.

Recognizing the complexity of many modern conflicts, the U.S. Army and the U.S. Marine Corps have attempted to adjust their planning processes to better meet current challenges. The result is that each service has introduced “operational design” (or just “design”) into its doctrine. Operational design is a focused attempt to understand the nature of the problem as broadly as possible. Our understanding of a problem often dictates our approach to solving the problem. An improved understanding of the nature of the problem facilitates a comprehensive solution. Given the complexity of modern problems, if design does not lead to a solution, the objective is to conduct operations that will lead to an improved situation.

Conclusion

Planning plays a critical role in the successful conduct of military operations. Planning allows commanders to conceptualize and articulate desired future conditions to their subordinates. Operational plans also provide a tool for commanders to articulate their vision to subordinates. Operational plans allow the efforts of many units to be combined and harmonized in order to achieve the established objectives. The goal of this coordination is to make the best use of scarce resources. In addition, good plans are simple and clearly communicated, and provide guidance to subordinates without being overly prescriptive.

PLANS, WAR

Throughout the 20th and 21st centuries, the U.S. military's interest in planning for war has increased exponentially, as has its ability to do so, often in response to lessons learned from past military actions. From early plans aimed at fighting a single enemy determined to violate the Monroe Doctrine or threaten the Open Door, a U.S. policy that supported open trade in China and discouraged further colonization of the weakened Chinese Empire, to more recent plans to defend vital interests in far-flung regions, war planners have labored to develop proposals to defend the nation's interests. In some cases, including the Pacific War against Japan, existing plans were put into practice, while other, elaborately detailed plans, including those to wage atomic war against the Soviet Union, were not. Initially, civilian leaders often remained aloof from war planning, but by World War II, presidents and influential leaders of the civilian bureaucracies began to leave an indelible imprint on war plans and planning, contributing to victory in America's epic global struggles but leading to far less-clear cut results in more recent conflicts. This entry discusses the history of war planning by the U.S. military and provides details on the planning for the War in Afghanistan, Operation Enduring Freedom.

To World War I

At the start of the 20th century, a host of issues and ideas at last prompted the U.S. military to formalize

the process of war planning. Beginning in the 1880s, the increased professionalization of leading foreign armies, particularly those of Germany and Japan, prompted leaders such as U.S. Army general Emory Upton to call for the establishment of an army general staff to develop war plans on a systematic basis. While the army was slow to act on these recommendations, the U.S. Navy in 1884 established its own war college, the entity that eventually spearheaded that service's war planning activities. Following the Spanish-American War, both the army and the navy, as well as senior civilian leaders, recognized the need for reform and professionalization of the armed services. In 1900, President William McKinley approved the creation of the 11-member Navy General Board. In 1901, under the auspices of Secretary of War Elihu Root, the U.S. Army established the U.S. Army War College and, just 2 years later, created a U.S. Army General Staff. In short order, the secretaries of war and the navy established the Army-Navy Joint Board to, among other things, coordinate army and navy war planning.

Early-20th-century war planning, which designated potential enemies by color and/or initials, had little civilian oversight or coordination with major government departments such as the Departments of State and Treasury. War planners particularly focused on Japan (Orange), whose victory over Russia in the 1904–1905 Russo-Japanese War and clashes with Washington over discriminatory treatment of Japanese living along the Pacific coast caught the attention of the army and navy. Continued disorder in Mexico (Green) led army planners to direct their attentions to the republic's southern border, while fear over German expansion into the Western Hemisphere led naval planners to create War Plan Black.

War Plan Black, which envisioned a decisive naval battle in the Caribbean and the repulsing of a German landing either there or on the U.S. coast, ended up being not completely useful when the United States entered World War I in April 1917. The task of revising plans to defeat Germany then fell to General John J. Pershing and the staff of the nascent American Expeditionary Force beginning in May 1917. While prewar planning against Black proved of limited value, the U.S. Army did put into effect its prewar plan for war with Green in 1916, when General Pershing led an expeditionary force south into Mexico following Pancho Villa's repeated raids on U.S. territory.

The Interwar Period

As was the case after the Spanish-American War, both civilian and military leaders made important changes to improve planning for future conflicts during the interwar period. The General Board, for example, was reorganized in 1919 to include a joint planning committee. General Pershing with his wartime experience, meanwhile, led the U.S. Army General Staff to reorganize in 1921 and to include a new war plans division, tasked with developing army war plans and coordinating strategic planning with its sister service, the U.S. Navy. The navy organized its own war plans division that same year, based in part on the wartime experiences of Admiral William S. Simms, who commanded the U.S. naval forces in Europe during World War I.

During the early interwar period, planners concentrated on a host of potential threats. Simmering differences over immigration, quarrels involving the Open Door, and the seizure of Manchuria in 1931 led planners to focus their greatest attention on War Plan Orange. During the Second World War, both the army and the navy used parts of the various interwar versions of War Plan Orange, including a naval blockade of Japan and attacks on the Ryukyus.

Revolution and nationalism also influenced war planning during the 1920s and 1930s. The Bolshevik victory in Russia, the spread of the revolution into Finland, Hungary, and Germany, and the concern that revolution might spread to the United States led the Army War Plans Division to begin formulating Plan White (domestic uprising) in late 1919. Active planning to suppress a domestic insurrection continued for another two decades. The Bolshevik specter in China and the reality of Chinese nationalism and its apparent anti-foreignism also led to a new Plan Yellow in 1924, which remained in effect until the end of the 1930s and envisioned the dispatch of up to 40,000 soldiers to protect Americans in China.

World War II

The spread of war, first to Asia in 1937 and then to Europe in 1939, along with the conclusion of the Tripartite Pact (or Axis Alliance) in September 1940, led to the creation of a series of Rainbow War Plans aimed at fighting the Axis coalition. The Rainbow Plans recognized that Germany posed the greatest threat to the United States, and therefore advocated waging a defensive war in the Pacific while allocating

the majority of men and materiel to the European theater. In early 1941, war planners began to consult America's soon-to-be wartime allies, including Great Britain and Canada (the ABC 1 talks), about the various Rainbow plans, which unlike earlier planning was Cassandra-like in its accuracy. By late 1941, when the planners finalized Rainbow 5, they foresaw the conflict that America was on the eve of entering, a simultaneous war against Japan and Germany waged by an Anglo-American coalition.

With America's entry into the war, British and American leaders created a Combined Chiefs of Staff. The creation of the Combined Chiefs of Staff, which underscored the need for greater cooperation within the U.S. military, quickly led to the creation of the U.S. Joint Chiefs of Staff a month later. This machinery, argues Steven T. Ross, the preeminent historian of U.S. war planning, allowed the Allies to plan operations and air differences far more successfully than the Axis countries.

The Cold War and Atomic War

World War II, much like previous major wars, led to modifications in American war planning. The 1947 National Security Act sought, among other things, to provide greater coordination between the various branches of the armed forces through the creation of a new Department of Defense. Conflict with the Soviet Union and the use of nuclear weapons dominated the new war-planning machinery during the Cold War period. Long before the term *Cold War* became embedded in the American lexicon and the national psyche, the Joint Chiefs of Staff began to formulate plans in the event of war with Moscow. Early planning, which assumed that a conflict would begin accidentally, presumed that despite initial losses in Asia and Europe, which were every bit as catastrophic as those suffered early in World War II, the United States would win a total, as opposed to limited, war against the USSR (Union of Soviet Socialist Republics) by compensating for Western conventional inferiority with nuclear superiority. Significantly, war planners accepted that in a major conflict with the USSR the United States would strike first, using nuclear weapons, a decision formalized by President Harry S. Truman in NSC (National Security Council) 57.

With Russia's development and subsequent expansion of its atomic stockpile, the historian Lori Bogle notes, war planners conducted their trade

“with a regularity and intensity unprecedented in peacetime.” Led by planners within the Joint Chiefs and the Strategic Air Command, often with scant guidance from the newly created National Security Council, strategists planned to deter conflict through tactics such as massive retaliation, in which the United States would employ America’s massive nuclear arsenal, a policy first publicly announced by Secretary of State John Foster Dulles in 1954 and adopted by the North Atlantic Treaty Organization 2 years later. Initially, the army, navy, and air force developed separate operational plans for the use of their nuclear arsenals in the event of war against the Soviet Union. In 1960, the Defense Department, at the behest of President Dwight Eisenhower, developed a Single Integrated Operational Plan to coordinate nuclear war planning across service lines.

As Soviet and American stockpiles increased, the new theory of mutually assured destruction (MAD), which recognized the practical inability of either side to win, let alone survive an all-out nuclear exchange, came to the forefront of war planning and nuclear deterrence strategy. By the mid-1970s, however, advances in technology allowed some Pentagon war planners to chart a course embodied in President Richard Nixon’s National Security Decision Memorandum 242 and later in President Jimmy Carter’s Presidential Directive 59 (PD 59), which disavowed mutually assured destruction, in favor of a massive first strike using precision-guided nuclear weapons that would allow the United States to win a nuclear war.

Post–Cold War Planning

Reflecting the lessons learned from the Vietnam War, a new generation of post–Cold War strategists produced war plans that embraced Joint Chiefs of Staff Chairman Colin Powell’s doctrine that the United States would employ massive rather than limited military force against its enemies. For Operation Desert Shield, which protected Saudi Arabia and the Gulf states following Iraq’s August 1990 seizure of Kuwait, the United States and its coalition allies built on plans recently formulated by the Navy War College and the U.S. Central Command’s (CENTCOM) own Operation Internal Look, which called for sending 150,000 Americans to defend the Gulf. By early November, just 3 months after the fall of Kuwait, CENTCOM’s commander, General

Norman Schwarzkopf, had assembled over 200,000 Americans on the ground in or near Saudi Arabia. To dislodge the Iraqis, Schwarzkopf needed to double the American contingent, and with Powell’s enthusiastic support, Operation Desert Storm, which liberated Kuwait in February 1991, used more than 500,000 American and an additional 400,000 coalition personnel.

Success in the Persian Gulf War validated the Powell Doctrine, yet despite Powell’s ascension to secretary of state in the first George W. Bush administration, his doctrine fell out of favor. Planning for Operation Enduring Freedom, the war in Afghanistan, began at the behest of Secretary of Defense Donald Rumsfeld a day after the 9/11 attacks and aimed at the destruction of both al Qaeda and the Taliban. Relying heavily on air power, special forces, and CIA (Central Intelligence Agency) paramilitary, as well as troops from the anti-Taliban Afghan Northern Alliance, Enduring Freedom, which began on October 7, 2001, and ended the following March, used few U.S. ground troops. Despite State Department misgivings, Secretary Rumsfeld and General Tommy Franks, CENTCOM commander, opposed a large deployment of U.S. forces both during the invasion and in the aftermath of the Taliban defeat. They therefore limited the size of the U.S. presence in Afghanistan during 2002 to 8,000, which, while sufficient to topple the Taliban and weaken al Qaeda, could not adequately stabilize the country. An intractable insurgency soon developed, and this so-called light-footprint approach came under increasing fire as the war in Afghanistan dragged on into its second decade.

The light-footprint approach favored by Secretary of Defense Donald Rumsfeld’s office was clearly evident in Operation Iraqi Freedom, a war plan that discounted the Powell Doctrine as well as the views of senior officials, including Army Chief of Staff Eric Shinseki, who maintained that the U.S. troops leading the invasion would prove inadequate in the immediate postwar occupation. In 1996, war planners had produced the basic outline of what would eventually become Operation Iraqi Freedom, War Plan 1003V, which envisioned needing 1,000 aircraft and three corps to defend the Gulf allies and successfully drive to Baghdad. During the run-up to Operation Iraqi Freedom, war planners from CENTCOM and V Corps faced intense pressure from the Department of Defense to forgo a slow buildup and to attack with a

small U.S. ground force. During 2002, CENTCOM commander General Tommy Franks pared the number of troops from War Plan 1003V's 400,000–500,000 to approximately 275,000. Subsequent plans, including Running Start and Generated Start, increasingly featured fewer troops and a shorter air campaign. On the eve of the invasion, V Corps leaders determined that current war plans did not provide enough ground troops to secure captured territory. Nonetheless, the U.S.-led invasion of Iraq commenced 6 weeks later with an American force of fewer than 150,000. As in the case of Afghanistan, the forces at hand proved more than adequate to decisively defeat the enemy but were spread far too thin to stabilize the country.

Conclusions

From its inception, war planning has proved an invaluable tool in the effort to defend the United States. Although sometimes flawed and other times manipulated by those whose political or other ambitions dictate unrealistic approaches to success, war planning nonetheless has fostered security through its proactive activities as well as by promoting coordination among the various branches of the armed forces and the civilian bureaucracies.

POLICE, MILITARY

Military police have a challenging position within the armed forces. On the one hand, they must provide law enforcement duties at army posts and air force, marine, and naval bases and stations, which, in part, resemble those performed by civilian police. These duties include combating crime by service personnel and, in some circumstances, by civilians, whether they are U.S. citizens or foreign nationals; maintaining discipline among members of the armed services; providing security for military installations; and administering military confinement facilities. This entry discusses the history, roles, and organizations of military police in the U.S. armed forces.

Wide Range of Duties

One of the major differences between civilian and military law enforcement agencies is that the military police not only enforce the law, but they also maintain the equivalents of jails and prisons. The armed services' experiences with confining prisoners can be extremely useful during expeditionary service, when there are likely to be enemy combatants or civilian internees, or both, who must be held, at least temporarily.

On the other hand, police services are much needed in combat situations and as an element in military expeditions when combat is a possibility. Police services on or near battlefields may include keeping combat troops in their places at the front when some of them may want to flee the dangers of battle. The processing and supervision of prisoners

of war and the management of prisoner-of-war and internment camps outside the battle zone are other vital contributions. Effective military police handling of prisoners has been the norm. The bizarre behavior of some prison staff at Abu Ghraib in Iraq, however, necessitated improvements in prison administration.

Controlling vehicle traffic is a major assignment for military police. Delays in the movement of personnel and supplies can have a serious impact on military operations. Traffic bottlenecks may, moreover, become targets for enemy artillery and air attacks. Expeditionary force commanders must be kept aware of such combat duties. If they think that the police act primarily in a rear area support role, commanders may fail to include sufficient numbers of police in their personnel planning.

Organizations and Training

The need for effective law enforcement organizations and suitably trained and indoctrinated personnel within the various branches of the U.S. armed forces became apparent soon after those branches were established. Yet for much of their history, the armed forces have employed makeshift approaches to law enforcement. They frequently assigned officers and enlisted personnel to police duties without doing much or any screening and without providing specialized training. When leading the Continental Army during the American Revolution, George Washington tried to form an effective, centralized military police force, but for the most part, he had to utilize short-lived units. The most extensive use of military police during

wartime was the Provost Guard of the Confederate States Army, which, in addition to enforcing discipline within the army, extended its reach to civilians through the use of internal passports that regulated travel.

Permanent organizations devoted to law enforcement duties and schools for training police are largely a product of World War II and its aftermath. The army, for example, only established the Military Police Corps on September 26, 1941; it became a permanent part of the army on June 28, 1950. Army officers who command military police at various levels, such as a division or an army post, are designated as “provost marshal.” The army’s highest military police officer is the provost marshal general. The growing role of women in the military police has been underlined by the appointment of the first woman provost marshal general, Brigadier General Colleen L. McGuire, in 2010. Appointment of military policewomen dates to World War II.

Military police are uniformed personnel, some of whom can carry out investigations of misdemeanors, but more extensive investigations are left to other agencies such as the army’s Criminal

Investigation Command (CIC), which was called the Criminal Investigation Division (CID) for many years and is still often referred to by that designation. Military investigators generally wear civilian clothing, in part because they need to be seen as somewhat apart from the military chain of command. The army also employs some civilian investigators.

From its earliest years, the navy designated some personnel to combat crime and to assist the officers in preventing lapses in discipline aboard ship. The use of such “masters-at-arms” has developed into a structure similar to the army’s military police. The Law Enforcement/Master-at-Arms School was established in 1985 as part of the Naval Technical Training Center at Lackland Air Force Base in San Antonio, Texas. Owing to the constant movement of vessels, the navy has had to employ and continues to employ large numbers of officers, petty officers, and lower-ranking enlisted men and women as temporary law enforcement personnel as part of the “shore patrol” organizations that are established in ports.

The Naval Criminal Investigative Service (NCIS) resembles the army’s Criminal Investigation

Brigadier General Colleen L. McGuire assumed responsibility as the first woman provost marshal general of the army and also took command of the U.S. Army Criminal Investigation Command in a ceremony at Fort Belvoir (June 2010).

Command in its duties, but it has a quite different organization. It is headed by a civilian, and the majority of its agents and employees are civilians. The CIC remains a largely military force and is headed by an army officer. The NCIS evolved as part of the Office of Naval Intelligence (ONI), which was established in 1882. It became the Naval Investigative Service in 1966, although it remained within ONI. In 1982, NCIS achieved independence from ONI, and the first civilian director was appointed in 1992.

As in the Royal Navy, U.S. Marines assigned to larger warships were intended, in part, to constitute a deterrent to organized resistance by mutinous sailors to the authority of their officers. Larger organizations of military police within the Marine Corps only came with World War II. In 1944, the 1st Provisional Military Police Battalion was established within the Fleet Marine Force Pacific. It lasted until 1946. Military police companies were employed in Korea, and two battalions were deployed to Vietnam. Detailed training for police duties only began during the Vietnam era, when marines began to be schooled by the army. The air force then undertook marine police training during most of the 1980s, but after the Gulf War, marines returned for training to the Army Military Police School at Fort McClellan, Alabama; it was subsequently transferred to Fort Leonard Wood, Missouri.

In 1999, there was an agreement that the Marine Corps Criminal Investigation Division (CID) would be “integrated” into NCIS. The marines’ CID has been left with the responsibility for dealing with a number of offenses, but investigations of the most serious crimes are the province of NCIS, which also includes some marine CID agents. Like the marine military police, marine investigators are trained by the army.

Shortly after the U.S. Air Force won its independence from the U.S. Army in 1947, a military police force was formed, although its members continued to wear what were essentially army uniforms for some time and were not called Air Police until 1948. The Air Police School and the Air Base Defense School were instituted in 1950 and 1952, respectively. The Air Police was somewhat different from the police of the other services because of the composition of the air force. That service was, and is, largely composed of air crews and a much greater

number of support personnel. Except for the Air Police, it lacked a significant land combat contingent. Hence, the Air Police had to fill this role and often engaged in ground combat when defending air bases in Vietnam and other later wars. They also play a critical role in guarding nuclear weapons and nuclear systems. The title “Air Police” was replaced by “Security Police” in 1966, and in 1997 it was renamed the Air Force Security Forces. Small numbers of women entered the force in 1971, and in 1985, restrictions on women in combat assignments were eliminated.

The air force also established the Air Force Office of Special Investigations in 1948. Agents for this investigative arm are drawn from both the uniformed ranks and civilians. Headquartered in Quantico, Virginia, it currently has a strength of about 2,700 active-duty and civilian personnel. Along with criminal investigations, a major mission of the Office of Special Investigations is to neutralize terrorist threats to the air force.

Hiring of Civilians as Uniformed Officers

A controversial move by the armed services in recent years has been the employment of civilians as uniformed police officers for security duties in the United States. One such force is the Department of the Army Civilian Police. The Pentagon Force Protection Agency operates in the area of the nation’s capital, and it has several components, including the U.S. Pentagon Police. There are pros and cons associated with the use of civilian police. On the one hand, civilian police officers can free members of the armed forces for other duties, including deployment overseas. On the other hand, many members of the armed forces believe that military personnel should provide their own security, even within the United States. Carrying out police services at installations in the United States is likely to produce experience that can be valuable for personnel and organizations that are deployed overseas.

Handling Stress

Like their civilian counterparts, military police forces are beginning to understand the emotional demands that their duties place on policemen and policewomen. Although other military personnel generally have a respite from trauma when they are

outside combat areas, military police have a relatively constant level of stress. People in law enforcement generally suffer to a greater degree than others from problems such as family violence, divorce, and suicide. Therefore, the army's Criminal Investigation Command has introduced a course of instruction called "Critical Incident Peer Support" to foster skills for dealing with the unusual stressors in police work. One technique is an informal debriefing that includes all the personnel involved in a given episode.

Expanded Role

Modern warfare, especially in the form of insurgency and counterinsurgency, is coming increasingly to resemble civilian law enforcement operations, although calling insurgents "bandits" or "criminals" is both inaccurate and unproductive. Thus, law enforcement training and experience can help military police render increasingly valuable services on counterinsurgency battlefields. A major factor in making military operations more like police work is the tighter rules of engagement, especially with respect to the use of weapons, for combat troops. Consequently, military police are particularly suited for counterinsurgency, and they may furnish additional contributions by training both U.S. and foreign military personnel for counterinsurgency and operations short of war. They can also be of great assistance in helping train foreign police.

In recent years, owing to the nature of current military assignments and the continuing threat of terrorist attacks, the armed forces have assigned more and more personnel to police duties. The numbers of military people assigned to police duties have increased significantly for the air force and dramatically for the army and navy. The army, for example, has considerably expanded the number of police assigned to protecting military and civilian leaders of the Department of Defense. The military situation has resulted in the rapid training and appointment of "provisional military police" by transferring some members of the National Guard to the Military Police Corps. Once prepared, they could replace the permanent military police, who would be transferred to higher priority assignments, or they could themselves be ordered to battle areas.

Their diverse roles make permanent organizational structures and planning for the military police

difficult. Nevertheless, military police forces have moved forward considerably since World War II, making them far better trained and administered today than at any time in the past.

POLITICAL SCIENCE AND INTERNATIONAL RELATIONS

The academic field of political science and the sub-field of international relations both emerged in the early 20th century. Scholars in the field seek to move beyond the study of individual events and develop a general conceptual framework to allow them to describe, explain, and predict actions in the

international system. Partly reflecting the impact of the two World Wars and the Cold War, the field's early work primarily focused on questions related to why countries go to war, how they reach peaceful accommodations, and why some move to form truly cooperative bilateral ties or international institutions. As the field matured and the international agenda shifted toward other issues, such as trade, development, the environment, and so on, the academic literature also expanded, but issues related to war and peace remain a high priority. This entry examines the diverse field of political science and the subfield of international relations, focusing on scholars' attempts to understand and predict a state's actions.

The field's work can be divided in a number of ways: by the method employed, by the level of analysis explored, or by schools of thought, such as realism, liberalism, Marxism, constructivism, and so on. Any typology, though, will leave out some important work and lead to disputes about which scholarship fits into each category. Because of the field's diversity and because of the huge number of changes in international actors, actions, and norms over the past century, a number of international relations hypotheses have been widely advanced and accepted, but there are few, if any, universally agreed-on rules of behavior.

Many policymakers, especially those dividing their careers between government service and academic theorizing, have been influenced by the existing academic work. This influence highlights the complicated issue of whether academic work is merely descriptive or also prescriptive. For example, if policymakers accept the descriptive idea that all states seek their national interests and will use force if necessary, they may prescribe following an aggressive policy, which in turn reinforces the descriptive idea.

Methods Employed

Before political science emerged as a distinct field, the study of international politics was dominated by historians, philosophers, and legal scholars. Political scientists sought to move beyond historians' case method to find general rules of behavior, beyond philosophers' abstractions to study the real world, and beyond legal scholars' applications of law to explore state actions that rarely were constrained

by international law. At the same time, the field inherited many assumptions, terms, and methods of study from its predecessors, so it mainly consisted of qualitative studies of states' security and diplomatic actions. Following World War II, behavioralists in political science suggested that the field needed greater methodological rigor to make it approach the scientific method of the natural sciences. These scholars brought in new ideas from economics, psychology, and statistics and took advantage of emerging computer technology to conduct more quantitative studies using large samples, game theory, and formal modeling.

In the 1980s, postpositivist theorists began to bring to the field another new set of ideas from literary criticism, feminism, philosophy, and other sources. These scholars questioned the idea that human actions can be studied in an objective and value-free way. Some also questioned the metanarrative of the field, arguing that existing understandings were not universal truths but, instead, intellectual constructs of the dominant discourse. Some also challenged the existing focus on state actors and high-level security issues by studying women, minorities, and others who saw personal security concerns and international transactions in their everyday life. Global surveys of today's international relations scholars find that a majority report that they employ qualitative methods but many report also using some quantitative analysis. In the United States, quantitative study is more prevalent than it is elsewhere. Smaller percentages of scholars, primarily in Europe and Australia, use postpositivist theory, but some of its concepts are incorporated into the rapidly emerging constructivist school of thought. Methodological disputes can be quite intense and frequently affect which journals publish certain research, which institutions employ certain scholars, and how new scholarship is treated by the academic community. These disputes are often difficult to categorize because they involve disagreements on both what to study and how to study it.

Levels of Analysis

Existing international relations scholarship also can be divided by whether its prime focus is on the system (third level), the state (second level), or the individual (first level). Most scholars agree that no one level can provide a full understanding of a state's

action, but there is disagreement over which level provides the most information. It is important that researchers and audiences consider the level of analysis because a focus on one level will affect both the methods of study and the findings, since variables on the other levels will be excluded.

System-level analysis examines events from the top down. States and other international actors are part of a collective system in which actions are guided by system characteristics and rules. The international system is characterized by anarchy, meaning that there is no central authority or world government guiding the system. Individual states seek power to advance their own interests. The system is dominated by the most powerful states. Powerful states not only win the big wars and reap the biggest benefits from trade, they also establish the norms and international laws that guide action. Systems can be described as unipolar, bipolar, or multipolar depending on whether there are one, two, or multiple great powers. There is dispute about which type of polarity produces the fewest wars but agreement that polarity highly influences the types of wars and alliance patterns. For example, the bipolar Cold War period saw more proxy wars and much tighter, long-term alliances than the multipolar period of the 19th century. System-level analysis also stresses a balance-of-power model, which predicts that states will form alliances to balance their collective power against that of an enemy alliance or a single dominant state. Using system-level analysis, the researcher does not need to examine individual state or leader characteristics because it assumes that all states, led by all leaders, will rationally respond in the same way to a given set of systemic facts.

State-level analysis argues that variables such as a state's culture, its economy, or its political structure will lead countries to behave differently even under similar systemic conditions. For example, German national character or history might explain why Germany was the center of both World Wars. Similarly, capitalist states might be driven by their economic needs to be expansionist. The question of whether democratic states are more peaceful than others has received a huge amount of attention in recent decades. Most studies have concluded that democracies in general are not more peaceful; in fact, some suggest that they are prone to fighting wars trying to spread democracy or to fighting wars as they themselves transition to democracy.

Most scholars, though, do believe that democracies are more peaceful toward other democracies, since there is no accepted existing case of two established democracies fighting a major war against each other. The explanation for the "democratic peace" has been a major source of academic work and controversy. Hypotheses include the importance of democratic checks and balances—that people will not vote for politicians who will send them to fight, respect for fellow democratically chosen leaders, the existence of shared interests among democracies, and the dominant positions of democratic England and the United States. Despite doubts over its cause and future sustainability, the phenomenon is frequently cited by academics as a major finding and by politicians as a justification for spreading democracy globally.

Studies using first-level analysis focus on the human role in international politics. Some focus on whether it is human nature to be aggressive and self-interested and, if so, whether that stems from mankind being sinners, biological impulses from the animal world, psychological pressures, demands of leadership positions, broader societal norms, and so on. Other work examines individual leaders to explore how factors such as misperceptions, religious beliefs, organizational behaviors such as groupthink, or idiosyncratic factors affect decisions and why leaders often choose war rather than cooperation.

Schools of Thought

Over the past century, realism has been the leading school of thought in international relations. Realism was developed formally in the 1930s by noted scholars such as E. H. Carr, Hans Morgenthau, and Reinhold Neibuhr, but many trace its intellectual roots back to Thucydides, Machiavelli, and Thomas Hobbes. Realists argue that states are the principal actors in the international system. International institutions and substate actors have little independent influence. All states rationally pursue their national interests, with the greatest focus on guaranteeing their security and survival. An anarchic system of competitive states is a "self-help" world where states fend for themselves, cooperation is rare, and the most powerful states dominate. A state's fate depends on its power relative to others, so it will rarely pursue collective goals and will even forgo

agreements that would increase its absolute gains if other states would gain more. States fight frequently as they pursue their interests, but even more commonly, states use open or implicit threats and intimidation. Cooperation occurs only in times of shared interest, for example, defeating a common enemy, lasts only until the problem is resolved, and is never a deep commitment, because today's alliance partner may be tomorrow's enemy. Although in the 21st century fewer academics identify themselves as realists than in the earlier periods, adherents of other perspectives still often couch their work as a critique or response to realism.

In the 1970s, Kenneth Waltz led the neorealist, or structural realist, movement, which modified some realist ideas. Whereas early realists built their models up from ideas of human nature to competitive states to how that shaped systemic action, neorealists begin their analysis with the characteristics of the system. Anarchy and state actors that are all functionally the same and thus differentiated only by their power levels are the defining traits of the system. Neorealists, thus, argue not only that state or individual characteristics may matter to a small degree if you are studying specific foreign policy decisions but also that they can be ignored in generating a parsimonious general theory of international relations. Disagreements between realists and neorealists are important, but in the end, most of their theoretical conclusions are similar. In recent years, neorealists too have subdivided into two camps. Offensive realists argue that states will always try to maximize their power and act aggressively, seeking hegemony to ensure their security. Defensive realists argue that states recognize that in some eras the offense-defense balance tilts toward defense or the costs of war escalate, so states will limit aggression and focus on defensive military strategies and weapons. These different views lead to practical disputes over issues such as how a rising China will act and how others will respond. The disagreement's implications are lessened to some extent by the concept of the "security dilemma," which suggests that one state's defensive weapons procurement may be judged by another as an offensive threat, leading to an arms race and tension that leaves both less secure than originally.

A collection of liberal concepts has challenged realism. Liberalism's intellectual roots include the ideas of John Locke, Immanuel Kant, and Woodrow

Wilson and now include many strands of overlapping thought. In general, liberals hold that human nature does not inevitably drive states to aggression and that state preferences, as well as capabilities, are crucial determinants of behavior. Therefore, variables such as a state's national culture, whether it is democratic, whether it is economically integrated with others, what ethical goals it considers, or whether its citizens view themselves as global citizens are important and can lead to greater cooperation. Many liberals also argue that states are not unified actors, so substate actors like nongovernmental organizations can both lobby governments and form their own transnational networks. Above the state level, the desire for cooperation and technological advances in communications can stimulate the formation of international institutions that can constrain state members and, at times, become independent actors in their own right. Neoliberal institutionalists, such as Robert Keohane and Robert Axelrod, put particular focus on the way institutions increase cooperation through mechanisms such as increased information sharing, punishing cheaters, and repeated interactions among states. Most liberals do expect the end of war but think that force will increasingly be used to punish international rule breakers and be employed in collective action. Much early liberal work was considered hypothetical or idealist because it focused on the possible impact of changes in states or the system that did not seem imminent. However, in the 20th century, democracy spread, economies became interdependent, cultures changed, and more international institutions emerged, so debate now focuses on whether these changes are bringing the predicted increase in cooperation.

Marxist scholars, such as Immanuel Wallerstein and Andre Gunder Frank, challenge both realism's and liberalism's focus on state conflict and cooperation by arguing that economic realities and global capitalism drive the actions of individuals, states, and international institutions. They argue that the rich countries and corporations exploit the poor. Power flows from material wealth, so the rich have so much economic, military, political, and cultural power that they routinely crush any effort at rebellion. Occasionally, the rich powers will clash among themselves for control of a particular colony, region, or resource, but this does not alter the fundamental realities of the international system.

Constructivism is a rapidly emerging challenge to existing theories. Constructivists, such as Alexander Wendt and Martha Finnemore, focus on the power of ideas in shaping reactions to material factors and behavior. Whereas realists suggest that anarchy leads inevitably to state conflict, constructivists suggest that states choose how to react to this underlying fact and so may end up in conflict or cooperation. Once states choose a pattern of action, their choices become embedded in the norms of the system. In time, observers come to view the existing system as inevitable and static, whereas it is in fact contingent and malleable. Norms can change, thus ending practices such as slavery, the acceptance of attacking civilians, and perhaps some day war itself, but these norms change not from exogenous pressures but because the actors in the system have changed their ideas and perceptions of interest.

POLITICS, MILITARY PARTICIPATION IN

The military's participation in politics encompasses diverse topics within the study of military science. With a coup d'état at one extreme and military members casting ballots in civilian elections at the other, there is theoretically broad ground to cover. This entry discusses the impact of military voters on U.S. elections and the restrictions placed on service members with regard to political participation.

In the United States, the military as an institution has remained largely neutral in national political discussions, with the exceptions being far outnumbered by the norm of partisan detachment. The military is a generally well-respected institution in American politics, and because the armed forces serve as a potent symbol of patriotism and security, active and former military members have invoked their military background during elections since the beginning of the republic. Sometimes soldiers and veterans groups have vocally supported and endorsed candidates, and occasionally, they have even run for political office. From George Washington to John McCain, candidates have used their salient military experience as a springboard to win votes. While military veterans participate as candidates and voters at higher than average rates, active-duty members do not vote as often as civilians do. Members of the armed forces are mostly citizens and eligible to vote in elections, yet there have been many hurdles facing military participation in politics.

Legally, members of the armed forces do not enjoy the same freedoms of political expression as their civilian peers. Servicemen and -women may vote, and those serving overseas may cast ballots in their home precincts from afar. Members may also donate money to political efforts within the same limits as civilians. However, other forms of political activity are currently illegal for service members. The legal structure constraining members' behavior is the Uniform Code of Military Justice, which bans members from attending political rallies in uniform, running for political office, or working for a political

campaign. While protected by the First Amendment regarding civilians, these sorts of behaviors constitute excessively public partisan activity for those under arms, and hence, public electioneering efforts are prohibited for active-duty servicemen and -women. The intent of this ban is to limit the substance or appearance of the military taking sides in domestic partisan election contests.

But even if those in uniform have fewer means of participating in politics than civilians, the “soldier vote” has been important in a handful of American presidential elections. Three examples stand out as situations when the soldier vote was salient. In each, 1864, 1944, and 2000, questions of military suffrage and for whom the service members would vote were central. In the wartime election of 1864, Republican Abraham Lincoln faced his former general when trying to win reelection. The Democrats had nominated General George McClellan, who had been general in chief of all Union forces. It may seem plausible that soldiers in the Union Army might prefer a general to a president with little military experience of his own, but Republicans in many of the Union states passed unprecedented legislation enabling military men to cast ballots in their home state. They clearly believed that those in uniform would prefer their commander in chief over McClellan, and the voting returns validated their conviction: Estimates of the “soldier vote” preferring Lincoln in 1864 exceeded 75%. While not decisive in terms of the total election results, Union soldiers spoke clearly and in large numbers with their ballots, but such participation required the passage of partisan-minded and specific legislation.

In 1944, during World War II, President Franklin D. Roosevelt ran for his fourth term. The previous congressional election in 1942 had seen the innovation of a war ballot intended to make it easy for soldiers to vote, but the reform was poorly executed, and few took advantage of it. Hence, debate ensued over how to enable soldiers to vote in time for the 1944 election. Supporters of the legislation based their support on the belief that military voters would back the Democrats in office, and opponents of the legislation countered it for the same reason. A watered-down version was ultimately passed, but states were allowed to enact their own absentee balloting procedures. It is unclear what proportion of those in uniform voted; estimates suggest somewhat less than half. It is also uncertain, because of the diffusion of military ballots to home precincts and

states, whether servicemen supported Roosevelt at a rate higher than the civilian electorate.

The 2000 presidential election also made military voting significant, but not because of the high numbers. In the election contest between George W. Bush and Al Gore, Florida became the post-election battleground for recount politics, with the number of contested ballots exceeding the margin between the candidates’ vote totals. The unclear results during the multiple recounts gave both campaigns the incentive to favor their perceived bases of support. For the Democrats, this meant ensuring that every vote in urban areas was counted, and for the Republicans, the importance of military absentee ballots was paramount.

There is scholarly evidence to suggest that this presumption of Republican attitudes within the ranks was not misplaced. In 1999, the Triangle Institute for Security Studies conducted an expansive poll of military members, hoping to quantify what some observers had identified as a growing “gap” between the culture and politics of the military and the civilian society they were serving to protect. The evidence demonstrated that those in the officer corps were more likely to be Republican than Democrats. The 2000 election presented the military vote as important not for its large size but because it highlighted a growing trend toward Republican identification in the military since the end of conscription in 1973. Among the famously late overseas absentee ballots received in Florida in 2000, Bush ballots outnumbered Gore ballots by approximately two to one.

General William T. Sherman, the Civil War general who led the 1864 March to the Sea, famously refused to vote in elections while serving his country. He has been quoted as stating that “no Army officer should form or express an opinion” on partisan politics. Yet his has historically been a minority view among members of the military hoping to cast their ballot to influence elections just as civilians do. But history suggests that the suffrage of soldiers depends on political elites with their own electoral incentives.

POSSE COMITATUS ACT

The Posse Comitatus Act is a federal law that restricts certain types of military involvement in domestic law enforcement. The current statute, Title 18, U.S. Code, § 1385, states,

Whoever, except in cases and under circumstances expressly authorized by the Constitution or Act of Congress, willfully uses any part of the Army or the Air Force as a posse comitatus or otherwise to execute the laws shall be fined under this title or imprisoned not more than two years, or both.

This entry discusses the origins and provisions of the Posse Comitatus Act.

The act is statutorily inapplicable to the U.S. Navy and the Marine Corps, although it has been applied by long-standing policy and regulations to those branches of service; the Coast Guard is also not technically covered by the act. The act also is not applicable to the states' National Guard and Air National Guard so long as those forces remain under the control of the respective states (i.e., as long as they have not been federalized); in the event of local or state unrest, the states' governors are free under the act to call forth these units to assist local law enforcement in maintaining public order. To utilize active-duty armed forces without violating the act, either an act of Congress or—as is generally the case in practice—a formal executive order of the president is required.

Besides the act's injunction against military incursions into domestic law enforcement, a related series of statutes—codified at Title 10, U.S. Code, §§ 331–336 (originating as the Insurrection Act of 1807) and §§ 371–382—specifies conditions under which the president can call for federal troops to halt civil disturbances, including federalization of a state's National Guard. Exceptions to the act include a statutory authorization for the military to remove persons from Native American lands and a law authorizing

the U.S. attorney general to request the secretary of defense to provide emergency military assistance if civil law enforcement is found inadequate to address threats involving the release of nuclear materials or the use of nuclear or radiological weapons.

In common law, *posse comitatus* is generally defined as being the power or force of the county, which the civil law enforcement may require as assistance to aid in keeping the peace and pursuing and arresting felons. Premised largely in response to British military violations of the colonists' civil liberties in the 1760–1775 period—during which regular troops often served as a *posse comitatus*, among other offenses—civilian control over the military was a critical feature of American democratic institutions. Among the Constitution's checks and balances in the area of civil-military relations, it is required that state militias, not regular troops, be requested by Congress “to execute the Laws of the Union, suppress Insurrections, and repel invasions” (http://www.usconstitution.net/xconst_A1Sec8.html).

The Civil War led to substantial incursions by the military into domestic freedoms, not only in the southern states under Union occupation but also in the North after President Abraham Lincoln's 1862 suspension of the writ of habeas corpus. During Reconstruction, the ex-Confederate states were divided into federal military districts to oversee the restoration of civil authority, the holding of elections and constitutional conventions, and the ratification of new federal laws and the Fourteenth Amendment. On occasions, U.S. Army units broke up the state legislatures of Louisiana and South Carolina, and federal military governors forcibly removed the governors of Virginia, Mississippi, Georgia, Louisiana, and Texas. In doing so, federal troops were functioning as a *posse comitatus*, in an 1854 U.S. attorney general's opinion. In response to fraud allegations during the 1876 presidential campaign, President Ulysses S. Grant ordered federal troops to guard polling booths and election officials across the South. In direct response to these actions, Congress passed the Posse Comitatus Act of 1878.

After the act's passage, it was largely understood that federal troops were not available to augment civil law enforcement, and prosecutions for violations of the act have been exceedingly rare. From 1877 to 1945, federal troops were summoned on approximately 125 occasions to intervene in civil disturbances. In many of these cases, however,

those troops were dispatched by presidents without any apparent state request or federal statutory justification, in contravention of the act. The use of U.S. Army troops against the 1932 “Bonus Army” protestors in Washington, D.C., by the then chief of staff General Douglas MacArthur is a notable example where the act’s restrictions were apparently ignored. From 1968 to 1972, the federal government deployed Regular Army troops on at least six different instances—including the 1972 Republican and Democratic conventions and the 1973 Nixon inauguration—without any prior requests from the state or local authorities.

In 1981, Congress passed legislation removing many barriers imposed by the act for drug interdiction missions, and the military began to provide civil law enforcement with training and surplus equipment. Regular Army troops were deployed to assist civilian law enforcement in several high-profile incidents—notably the 1992 Los Angeles “Rodney King” riots; the 1992 Ruby Ridge, Idaho, confrontation; and the 1993 Branch Davidian siege near Waco, Texas. In 1989, Joint Task Force 6 (JTF-6) was created as an adjunct to assist the DEA (Drug Enforcement Administration), the INS (Immigration and Naturalization Service), and the Customs Service and to supplement the military’s training in low-intensity conflict. JTF-6’s rules of engagement authorized military patrols to monitor the U.S.-Mexican border to interdict drug traffickers and to use deadly force only under limited circumstances. In May 1997, the shooting of a Hispanic American teenager, Esequiel Hernandez, by a JTF-6 U.S. Marine patrol led to congressional investigations and court-martial proceedings for the patrol’s members. Although the act was not legally implicated in the Hernandez case due to its statutory inapplicability to U.S. Navy and Marine Corps personnel, the incident was widely noted as highlighting the risks of using combat-trained troops as aids to civil law enforcement.

The September 11, 2001, attacks and concerns as to future terrorist attacks, the creation of NORTHCOM (the U.S. joint command created after 9/11 to safeguard North America), and the Homeland Security Act of 2002 were viewed as suggesting that the act’s days were numbered. The Bush administration’s National Strategy for Homeland Security expressed a desire for “a thorough review of the laws permitting the military to act within the United States in order to determine whether

domestic preparedness and response efforts would benefit from greater involvement of military personnel.” In the wake of the 2005 Hurricane Katrina, the National Defense Authorization Act for 2007, as enacted, included broad enabling language authorizing the president to employ military forces to

restore public order and enforce the laws of the United States when, as a result of a natural disaster, epidemic, or other serious public health emergency, terrorist attack or incident, or other condition, [the president has determined that] domestic violence has occurred to such an extent that the constituted authorities of the State or possession are incapable of maintaining public order.

This enactment, however, was fully repealed in 2008.

While the act may circumscribe the abilities of active-duty troops to participate directly in civil law enforcement, substantial authority already exists under the act for active-duty troops to be deployed as needed on the issuance of a suitable executive order. Following the act’s 1981 amendments, few legal obstacles currently restrict civilian law enforcement’s ability to call for and receive military aid, equipment, and training. Furthermore, provided that they are not directly used in law enforcement, relatively few practical legal restrictions now exist to limit active-duty troops from being used for disaster relief, homeland defense, nuclear/radiological disasters, and many other emergency response purposes.

POSTTRAUMATIC STRESS DISORDER

Posttraumatic stress disorder (PTSD) is a psychiatric stress and anxiety condition caused by witnessing or participating in a traumatic incident. According

to the American Psychiatric Association (APA), a traumatic event creates a sense of “fear, helplessness, or horror.” However, PTSD is not necessarily an inevitable consequence of a traumatic occurrence, and research is yet to determine why some people acquire PTSD and others do not. The definition and recognition of PTSD primarily arose through the observation and recording of veterans’ post-war experiences. Often culturally associated with the Vietnam War, combat-related PTSD has been known by other names in the past, such as “soldier’s heart,” “shell-shock,” “war neurosis,” “battle fatigue,” and “combat trauma.” Throughout the 20th century, the nature and therapy of traumatic syndromes resembling PTSD endured many debates: the veracity of the disorder, the treatment methods, the best time for treatment intervention, whether or not PTSD is distinct from other anxiety and depression disorders, and the burden of compensation for military veterans. The latest research explores the elusive possibilities of predisposition and vulnerability factors, for example, gender, genetics, socioeconomic status, and childhood abuse. High rates of PTSD among veterans of the 21st-century wars in Afghanistan and Iraq called for increased attention to PTSD prevention, screening, and treatment. This entry emphasizes combat-related PTSD and examines the definition, symptoms, and diagnosis of PTSD; treatments including military frontline treatment and screening efforts; and veterans’ benefits.

Definition

The APA first officially recognized PTSD in 1980 as an emotional disorder in the third edition of the *Diagnostic and Statistical Manual of Mental Disorders (DSM-III)*. Mental health professionals use the manual to diagnose psychiatric conditions. The APA’s inclusion of PTSD in the *DSM-III* resulted from a growing awareness of the psychological effects of the Vietnam War. In the 1970s, for example, mental health professionals such as Robert Jay Lifton, Chaim Shatan, and Sarah Halay, along with veterans groups, such as Vietnam Veterans Working Group, urged the U.S. Congress and the APA to recognize PTSD. Their efforts resulted in the *DSM-III* definition and inclusion of the syndrome. The APA’s *DSM-IV* (1994) defines PTSD as a reaction to exposure to a psychologically traumatic occurrence wherein the individual encounters a threat to life or severe injury to himself or herself,

or others. Traumatic stress exposure may result in immediate or enduring psychiatric conditions. The immediate and short-termed combat stress reaction (CSR) manifests as psychological disturbance or collapse in the combat arena. CSR shares similar anxiety and aggression symptoms with the longer term PTSD. Beyond an immediate breakdown, the APA categorizes yet another immediate response to trauma exposure, acute stress disorder (ASD), which endures longer than the immediate CSR, 2 days or longer. Characteristics of ASD include the variable symptoms of CSR and PTSD. The symptoms must persist for 4 weeks before they can be classified as PTSD. Several categorizations of PTSD exist. Acute PTSD symptoms endure for less than 3 months, chronic PTSD continues for more than 3 months, and delayed-onset PTSD manifests symptoms after 3 months or more.

Symptoms

Indications of PTSD include reliving the event through flashbacks, nightmares, and invasive memories; avoiding situations reminiscent of the event; lack of emotions; anxiety and difficulty sleeping; impulse control; alienation and intimacy problems; and substance abuse. The first two most common symptoms—memories and avoidance—are paradoxical in that individuals experiencing PTSD can encounter a barrage of intrusive images while at the same time avoiding anything that might remind them of the traumatic events. The psychological community often refers to complications of PTSD as comorbidities—other psychiatric and substance abuse or dependence disorders. Complications of PTSD include the hazards of alcohol and drug abuse as a form of escape and thus self-medication. Suicide is also a risk factor. However, other comorbidities can include chronic pain and life adjustment impairments, such as marital, familial, social, and occupation instability. Therefore, the complications of PTSD may extend beyond the individual with PTSD, affecting family members and the larger community.

While symptoms often appear within 3 months following a traumatic event, they can occur at any time, including decades after exposure. Veterans of the Iraq and Afghanistan wars, for example, often exhibit symptoms of PTSD a year after returning from the combat zone. Delayed symptoms can occur for

numerous reasons, including the possibility of redeployment and adjustments to civilian life, which highlight the distinction between living in survival mode while in the combat zone and irritability on returning to the civilian workforce and family life. Some individuals who fall into the category of delayed-onset PTSD have simply gone undiagnosed. Still others have experienced misdiagnosis, as is often the case with the depression that frequently accompanies PTSD.

APA Criteria for Diagnosis

DSM-IV includes six criteria for a PTSD diagnosis, labeled A through F. The first, Criterion A, requires that the individual who experienced or witnessed a traumatic occurrence(s) that posed a risk of death or serious injury to self or others also felt a powerful sense of “fear, helplessness, or horror.” The following requirements constitute three sets of symptom clusters. The first symptom grouping, Criterion B, addresses the reexperiencing of the traumatic event and requires one of the following five symptoms: (1) recurring and intrusive memories; (2) thoughts, or images of the occurrence; (3) habitual distressing dreams; (4) behaving as though, or sensing, the occurrence is returning; and (5) mental suffering when reminded of the event. The second symptom cluster of seven avoidance or numbing symptoms, Criterion C, requires a minimum of three symptoms: (1) evading discussions, contemplations, and feelings about the event; (2) endeavors to elude circumstances reminiscent of the occurrence; (3) failure to remember central elements of the event; (4) a noticeable lack of concern for, or involvement in, important occasions; (5) a sense of alienation; (6) lack of intimacy; and (7) no long-term hopes or plans. The third symptom cluster, Criterion D, addresses hyperarousal and requires a minimum of two of the following five symptoms: (1) insomnia; (2) a bad temper; (3) trouble focusing; (4) excessive alertness; and (5) disproportionate “startle response.” Criterion E entails symptoms that exceed a month’s duration. The final criterion, F, necessitates symptoms that considerably disrupt the individual’s ability to function socially and occupationally. These diagnostic criteria demonstrate the complex nature and wide-ranging impact of PTSD on the individual and society. However, debates continue regarding the objectivity of the diagnosis criteria, due to the variability and subjectivity of symptoms based on self-reporting. Moreover, studies

continue to explore the possibilities that head injuries may contribute to PTSD or the misdiagnosis of PTSD because head injuries, especially multiple concussions, exhibit symptoms similar to PTSD.

Treatment

Because the stress levels accompanying traumatic events have an intensity that may alter brain chemistry, the most prevalent treatment for PTSD is an SSRI (selective serotonin reuptake inhibitor), a pharmaceutical frequently used to treat depression. Other common treatments for PTSD include various types of counseling—talk therapy or psychoanalysis; a holistic mind, body, and soul therapy; stress reduction techniques; group therapy; and cognitive-behavioral therapy (CBT)—a classification of time-limited therapies. CBT therapy accentuates self-awareness and

retraining so that learned behaviors can be unlearned. More recent treatments include rapid eye movement (REM) therapy and exposure therapy. REM therapy involves the affected individual conjuring up negative images while the therapist directs the eye movement patterns. Although researchers are still not certain how and why REM therapy works, the theory behind the therapy is that it may retrain pathways in the brain. Exposure therapy gradually exposes the individual to realistic renderings of the traumatic event. After prolonged exposure, the individual may become desensitized to the traumatic stimuli. Research exploring the use of virtual reality exposure therapy to create a more realistic depiction of the traumatic circumstances is under way. Moreover, experts in the fields of the neurosciences and pharmacology continue to seek treatment possibilities.

U.S. Air Force Senior Airman Joseph Vargas, a pharmacy technician with the 779th Medical Support Squadron, uses the Virtual Iraq program at Malcolm Grow Medical Center's Virtually Better training site at Andrews Air Force Base, Maryland. The 79th Medical Wing is one of the eight wings that use this new technology to treat patients suffering from posttraumatic stress disorder. The virtual reality-based software is designed to re-create a traumatic situation in a safe environment. Redeployed service members with posttraumatic stress disorder use this software as part of their therapy. *Source:* U.S. Air Force photo by Senior Airman Renae Kleckner (released).

Frontline Treatment

Frontline treatments for CSR endeavor to prevent longer term PTSD, to reinforce the normalcy and temporality of the condition, and to maintain frontline troop numbers. Common current techniques for the frontline treatment of CSR emerged in the aftermath of World War I. Rather than evacuating affected soldiers to the rear or to a hospital, frontline treatment aims to maintain the soldier's status and associations with his or her unit. There are three core elements in frontline treatment: (1) proximity to the traumatic event, that is, treatment should be administered in-theater if possible; (2) immediate treatment, as circumstances permit; and (3) an expectation that the soldier will quickly return to his or her unit. Treatment for CSR entails providing rest, nourishment, and clean clothing; permitting the individual to vent his or her feelings; assigning simple tasks; and reassuring the soldier that symptoms will likely improve in a matter of hours or days. Persisting symptoms require medical examinations, suicide prevention measures, and sometimes brief evacuations to medical or logistical units within close proximity to the soldier's unit. Treatment for prolonged symptoms also emphasizes rapid reintegration of the affected soldier into his or her unit.

In the wars in Iraq and Afghanistan, the U.S. military increased training for frontline officers and medics to aid in the identification of, and treatment for, CSR and PTSD. Attempts to make mental health professionals and treatment readily available on the front line resulted in the inclusion of mental health professionals in some medical units and the in-theater integration of combat stress teams, which provide spontaneous mental health tents where soldiers can relax, eat, and sleep. The U.S. military is undertaking efforts to provide telemedicine—videoconference and e-mail counseling and therapy—to improve access to mental health care for soldiers; yet these endeavors are dependent on infrastructure, funding, and technological limitations. However, military hospitals are implementing telemedicine to alleviate the increases in state-side demand for mental health treatment.

Military Screening

It is especially challenging to conduct predeployment and postdeployment screenings in the all-volunteer military. Predeployment screenings risk

false results among personnel who wish to deploy because the tendency among these soldiers is to minimize symptoms. Postdeployment screenings also frequently result in personnel dismissing and not reporting symptoms because their leave will be delayed, and perhaps exhausted, by further screening and interviews with psychologists or psychiatrists. In addition, psychiatric conditions clash with the warrior culture of the military, and some still regard them as a sign of weakness. Soldiers seeking a military career will also likely minimize their symptoms out of fear of damaging their chances of promotion. Reluctance to seek treatment, however, can lead to administrative discharges for patterns of misconduct that could be related to PTSD symptoms and can place the veterans benefits of the soldier at risk.

Stigma Reduction

Since September 11, 2001, and the wars in Afghanistan and Iraq, the American public is more accepting of PTSD as a scientifically proven medical condition and a normative response to extraordinary circumstances. Civilian acceptance of mental health issues and treatments, as evidenced by the common diagnosis and pharmaceutical treatment of depression, may also influence the acceptance of PTSD. Military predeployment and postdeployment screenings, education, training, and frontline treatment culminate in a concerted effort to reduce the stigma of PTSD in the military.

Veterans' Benefits

In 2010, the U.S. Department of Veterans Affairs (VA) retroactively eliminated the requirement to document specific events that may have caused PTSD in order for veterans to receive health care and disability benefits. The regulation aims to simplify claims to a diagnosis of PTSD and proof of service in a combat zone in a role consistent with the event(s) the veterans believe caused their condition. The VA intends the new requirements to help simplify and expedite the claims process for access to medical care and benefits. The VA also hopes that the new regulations will facilitate equal access for female veterans who, though barred from serving in combat branches according to official military policy, are often attached to combat units and have in the wars in Afghanistan and Iraq unavoidably experienced combat.

POWELL, COLIN

Former secretary of state and retired four-star general Colin Luther Powell served in the U.S. armed forces and government over a 47-year career, from the eve of the Vietnam War to the post-9/11 invasions of Afghanistan and Iraq. Born in Harlem, New York, in 1937, Powell joined the Reserve Officers' Training Corps in 1954 at City College of New York. A Distinguished Military Graduate, he was commissioned second lieutenant in 1958 and deployed in 1959 to West Germany. Stateside from 1960 to 1962, Powell married and was then deployed to Vietnam for the first of two tours (1962–1963, 1968–1969). In 1970 and 1971, he was promoted to lieutenant colonel and earned a master's in business administration at George

Washington University. Powell made many political contacts as a White House Fellow in the Office of Management and Budget during the Nixon administration (1972–1973), but he returned to military command and quickly rose through the ranks, earning his brigadier general's star by age 41. The Reagan administration tapped the young general to serve as military assistant to the secretary of defense and later as national security advisor (1987–1989). Rising to four-star general in 1989, Powell served Presidents George H. W. Bush and Bill Clinton as chairman of the Joint Chiefs of Staff (1989–1993) and was secretary of state under President George W. Bush (2001–2005). This entry examines Powell's career and his views on war.

Vietnam and the Formation of Powell's Beliefs on War

Though clearly influenced by the work of Carl von Clausewitz, Colin Powell's thinking about war stemmed in part from his experiences in Vietnam. Deployed in 1962 as a specially trained military advisor to the South Vietnamese, Powell quickly grew frustrated with orders from Washington that failed to correspond with the realities on the ground—he later derided the search-and-sweep techniques and body counts demanded by stateside officials as “nonsense.” Powell's (1995) memoirs reveal that his return to Vietnam in 1968 added to his frustration, particularly with fellow officers willing to “quietly acquiesce in halfhearted warfare for half-baked reasons that the American people could not understand or support” (p. 149). Not coincidentally, Powell would later develop doctrinal guidelines designed to avoid involvement in wars without clearly articulated aims, American popular support, and unflinching commitment to seeing the task through.

From Officer to Washington Insider: Powell in the Reagan Administration

Powell's thinking about war and politics developed further during the early 1980s, while he was aide to Secretary of Defense Caspar Weinberger. Weinberger's vocal opposition to American military intervention in Lebanon symbolized a view both men shared: Military deployments abroad demand caution, clarity of purpose, and unequivocal political support and should occur only as a last resort, when national interests are at stake. Powell also witnessed

the bureaucratic infighting endemic to Weinberger's rivalry with Secretary of State George Shultz, and consequently he was well prepared by 1986 to step into the role of deputy to National Security Advisor Frank Carlucci and in 1987 to replace Carlucci in that post. Powell had gained a reputation for being a cautious, moderate pragmatist, and as national security advisor he helped restore credibility and professionalism to the National Security Council in the wake of the Iran-Contra scandal. Powell's moderate views influenced Reagan's decision making on U.S. relations with Nicaragua and the Soviet Union. Unlike his old mentor Caspar Weinberger, Powell advocated U.S.-Soviet dialogue and played a role in bringing an end to the Cold War by helping prepare Reagan for summit meetings with Soviet General Secretary Mikhail Gorbachev.

Chairman of the Joint Chiefs of Staff Under Bush and Clinton

As the global Cold War receded, regional conflicts took center stage in the Americas, the Middle East, and the Balkans. As chairman of the Joint Chiefs of Staff under President George H. W. Bush, Powell coordinated several large-scale military actions in response to regional instability, including the invasion of Panama and the Persian Gulf War. The Panama intervention was the largest U.S. military action of its kind since Vietnam, but even it was dwarfed by the Persian Gulf War. As Bush's principal military advisor, Powell favored using overwhelming, decisive military force—but only as a last resort. Powell counseled the president to exhaust diplomatic avenues and sanctions before authorizing the use of force against Iraq, but simultaneously he also worked with General H. Norman Schwarzkopf of Central Command to mobilize and stage some 250,000 troops to protect Saudi Arabia. Powell's insistence that war plans required clear political goals generated friction within the administration, including clashes with Secretary of Defense Dick Cheney and even the president, but in general, he skillfully managed relations among civilian and military officials and he helped build and maintain a multinational coalition supporting military action against Saddam Hussein's forces. The UN-authorized, U.S.-led coalition force ultimately numbered more than 500,000, and when called on to expel Iraqi troops from Kuwait, it succeeded

in fewer than 100 hours. Many favorably associated the battlefield victory with the stipulations of the Powell Doctrine: Military deployments abroad require clear political and military objectives, public support for the mission, and use of overwhelming force. Critics, however, argued that the war did not require such massive troop deployments and that leaner interventions would allow the United States to have a more responsive, activist foreign policy in the post-Cold War world.

The tension between the Clinton administration's liberal internationalism and Powell's more cautious "realist" approach became palpable with Yugoslavia's bloody breakup and the consequent humanitarian emergency in Bosnia. Powell argued against limited military intervention in the Balkans, in part because he saw the proposed actions as failing to meet his doctrinal criteria. According to the biographer Christopher O'Sullivan, by comparing the Bosnian situation to Lebanon in the early 1980s and by encouraging restraint rather than intervention, Powell became "the skunk at the picnic" in administration deliberations about the crisis.

Insider on the Outside, Looking In: Powell as Secretary of State

A popular public figure after the Gulf War, Powell's struggles to fit with the Clinton administration diminished neither his popularity nor his standing in the Republican Party, and in 1995, he flirted with a run for the presidency. The election of George W. Bush to that office in 2000 led to Powell's appointment as the 65th secretary of state. Powell's military credentials allowed him to straddle the line between matters of diplomacy and defense, and he was one of a minority group of traditionalists resistant to Secretary of Defense Donald Rumsfeld's "transformational" agenda. Powell's public image initially overshadowed Rumsfeld's, but the September 11, 2001, terror attacks shifted attention and influence to Rumsfeld and like-minded unilateralists, including Vice President Cheney and prominent neoconservative officials who repeatedly undercut Powell's emphasis on multilateral diplomacy and military action as a last resort.

Powell supported the 2001 invasion of Afghanistan but warned that expanding the war could damage the international coalition being built against al Qaeda. Skeptical that Iraq posed a security threat and troubled by "Axis of Evil"

finger-pointing, Powell attempted to slow the march to war with Iraq in 2002 and 2003, with little success. His skepticism extended to war planning—he believed that the transformationalists’ reliance on lean invasion forces would leave them underprepared for postconflict occupation—but his influence over Bush and Cheney was limited, and his closed-door dissents went unheeded. At the time, Powell’s expressed concerns about a potential quagmire in Iraq remained private; in public, Powell loyally defended the administration’s decision for war against Iraq, and at the United Nations in February 2003, he argued the case for war. After resigning from office in January 2005, Powell expressed regret over the speech, which later was shown to have relied on misleading intelligence reports.

Assessing Powell

Powell is a unique, pathbreaking figure. A combat veteran who became the first African American four-star general, national security advisor, chairman of the Joint Chiefs of Staff, and secretary of state, his was a consistent voice of moderation and pragmatism in the administrations of four presidents. Powell’s accomplishments and dedication to military and public service are unimpeachable, but critical evaluation of his contributions and strategic thought is possible thanks to an array of published materials, including Powell’s autobiography and articles on war and diplomacy, reputable biographies by DeYoung and O’Sullivan, and scholarly articles evaluating Powell’s influence on foreign policy decision making.

PRESIDENT AS COMMANDER IN CHIEF

In the Constitutional Convention of 1787, the founders decided to move the war-making power from the executive, where it was exercised in Britain, to Congress. Their fear was that a president with war-making powers could become a dictator, like Oliver Cromwell in England. The Constitution therefore divided the powers, making the president the commander in chief of the military forces and giving Congress the power to fund the military and “declare” war. It did not say to “make” war, for that would have hamstrung presidential efforts to repel an invasion before Congress would have a chance to meet. In American history, there have been formal declarations of war only in 1812, 1846, 1898, 1917, and 1941. Since 1964, major military interventions have been explicitly approved by Congress without a declaration of war. This entry examines the approaches used and the strengths and weaknesses of U.S. presidents as commanders in chief.

Constitutional and Institutional Power

Although the Constitution empowers the president to serve as commander in chief, presidents have constitutionally and symbolically been viewed as civilians. In contrast to British monarchs, who don military uniforms, presidents since John Adams have worn exclusively civilian garb, even when reviewing troops. The Constitution is vague on the powers of the president as commander in chief and puts in few direct restrictions. It does declare that the writ of habeas corpus can only be suspended in time of war or insurrections and places limits on the reasons why the militia can be called up for active federal service.

Since the founding of the republic, there has been heightened conflict between the congressional powers to make war and the presidential powers as commander in chief. Congress, through the power of

the purse, does have the ultimate power to halt any military action by withholding funds. Moreover, the U.S. Senate must confirm the appointment of every commissioned officer, from the lowest lieutenant to a five-star general. On occasion, Congress has cut off funds for military operations, and the Senate has withheld or delayed confirmation to assert congressional authority. But the general pattern, especially in wartime, is to give the president wide latitude even in unpopular conflicts.

The Supreme Court has with few exceptions shied away from ruling on the powers conferred the president as commander in chief, especially in the area of making war. Congress, in the aftermath of the Vietnam War, passed the War Powers Act in 1973, which places strict limits on presidential war making. However, every president since then has questioned its constitutionality. Moreover, the War Powers Act has never been fully tested either politically or constitutionally.

World War II and the Cold War that followed had a profound impact on the institutional powers of the president as commander in chief. The creation of the Joint Chiefs of Staff by Franklin Roosevelt, later institutionalized by law in the National Security Act of 1947, afforded the president direct access to military commanders. The creation of the National Security Council in 1947 sought to provide better coordination between the State Department and the military in formulating foreign and defense policy. Although presidents have varied in how they use the National Security Council, this has served to buttress a growing consensus in Washington that it is imperative that the vice president be kept abreast of national security policy. The formation of the National Security Council fostered creation of the position of national security advisor and attendant staff within the executive office of the president. This advisor and staff have provided successive presidents with significant advice and ways to implement policy that is independent of the State and Defense Departments. For instance, under President Richard Nixon, Henry A. Kissinger as national security advisor opened direct negotiations with the People's Republic of China. A number of national security advisors and a significant portion of the staff have been active-duty or retired military officers.

On the most basic level, presidents today have much more contact with military officers than did their counterparts prior to World War II. Since the

1960s, a military aide carrying a "nuclear football" follows the president everywhere to provide the commander in chief with the ability to respond to a nuclear attack immediately. A range of White House functions, especially in the area of transportation and communication, are carried out by active-duty personnel. The presidential retreat, Camp David, established by President Franklin D. Roosevelt, is maintained by naval personnel.

The communication revolution, especially radio and satellite communication, has profoundly shaped the relationship of the president with military and naval commanders in the field. For instance, naval vessels at sea prior to radio had no direct communication contact with shore commanders until they docked in port or received a message from another ship. Radio communication, and later satellite communication, allows a president to track the movement of naval vessels and have real-time communication with commanders and subordinates anywhere in the world. Since 1961, the White House has maintained a secure Situation Room that both tracks worldwide political and military development and serves as a secure facility for communication in times of crisis.

Historical Precedents, 1794–1940

When farmers in western Pennsylvania protested the whiskey tax in 1794, they attacked federal officials and closed down the federal courts. President George Washington took immediate action. He called on governors to provide militia and personally led 12,000 soldiers into western Pennsylvania. The protesters dispersed, and the power and prestige of the president as commander in chief were confirmed. John Adams, however, was less successful in sustaining the president's role as commander in chief. A major war scare in 1798 between France and Britain led to a diminution in presidential power after Alexander Hamilton, who was out of office but controlled the Federalist Party, saw an opportunity to rally public opinion and overwhelm the Republicans as well as defend against a possible French invasion. Congress, controlled by Hamilton's allies, set up a new standing army, with George Washington in nominal control and Hamilton in actual control. Republicans, fearing the army would be used to invade states like Virginia, were ready to use their state militias to resist. While Adams in

effect had been stripped of his role as commander in chief, he averted a war by sending diplomats to Paris to arrange a compromise. The war scare ended, and the new army was disbanded, leaving behind deepening fears among Republicans of the dangers of a standing army.

When Jefferson became president in 1801, he distrusted both the army and the navy as threats to republican values and civilian control. He created the United States Military Academy at West Point to provide a republican officer corps to eventually replace the predominantly Federalist officer corps. Jefferson sent the navy's best frigates into dry dock and built numerous small gunboats that could defend American ports from invaders but would not be an offensive threat to any nation. Jefferson, and President James Madison, believed that in case of war the local militia by the tens of thousands would spring to arms and constitute a good enough army. During the War of 1812, however, the poorly led and undersupplied regular army was practically helpless, and the militias repeatedly refused to leave their home states. The gunboats proved worthless as the British raided the coast at will and, in 1814, burned the national capital in Washington. Madison was baffled by his duties as commander in chief and was unable to pull the nation together or develop an effective strategy. When James Monroe became president, he appointed John C. Calhoun as secretary of war, and Calhoun thoroughly modernized the department, moving it from a patronage office to an agency with the mission of developing officers, training professional soldiers, and fighting and winning wars. There was no more reliance on the militia.

Unlike Madison and Adams, James K. Polk, who also lacked formal military experience, did much to buttress the president's role as commander in chief. After securing congressional authorization for the war against Mexico in 1846, Polk demonstrated able leadership. He used his patronage powers to dispense some 350 officer's commissions in order to shore up support for the war, and he oversaw successful military campaigns led by Generals Zachary Taylor and Winfield Scott. Polk's leadership so impressed Abraham Lincoln that he turned to his example during America's next great war.

Abraham Lincoln had the most challenging job as commander in chief. As the war broke out in April 1861, he coordinated state and national forces

and delayed calling Congress. In the first year of the war, Lincoln proved highly successful at enlisting bipartisan support, a policy he underscored by searching out and making generals of leading Democrats. His main weakness was tolerating the incompetent, patronage-oriented Secretary of War Simon Cameron, until he finally brought in a highly energetic and successful Edwin Stanton in 1862. Lincoln issued the Emancipation Proclamation on January 1, 1863, on the basis of his war powers, realizing that the emancipation legislation already passed by Congress would be ineffective. The proclamation had the effect of freeing most of the slaves in the Confederacy, and day by day, Union troops marched through and slaves were liberated. When draft protestors rioted in New York City in 1863 and threatened the war effort, Lincoln sent in combat troops with artillery; they shot grape down the cobblestone streets and crushed the uprising. But when protestors halted the draft in the Pennsylvania coal-mining districts, he left them alone, realizing he needed the coal more than he needed reluctant draftees. Lincoln spent many hours in the telegraph office reading the war dispatches and was increasingly prompted to remove generals who lost battles. His sharp, analytical mind grasped the larger strategic picture, and his attention to detail gave him a quick appreciation of the strengths and weaknesses of his generals. By late 1863, he had found Ulysses Grant, who not only was the aggressive general he needed but also supported Lincoln's emancipation policies and was willing to use Blacks in the army so that they could validate their claims to full citizenship. Lincoln as commander in chief used his war powers to begin the process of Reconstruction in the conquered areas of the South, repeatedly challenging the radical Republicans in Congress, who were much less interested in the reunification of the nation. Lincoln's assassination emboldened the radicals as the people demanded vengeance.

President Andrew Johnson proved inept in his use of the army as an instrument of Reconstruction and was stripped of most of his control over the military by Congress. In the disputed presidential election of 1876, a compromise was reached by which Republican Rutherford Hayes would become president and would immediately withdraw the army troops that were propping up Republican state governments in Florida, Louisiana, and South Carolina. Although he won a disputed election, Hayes soon

proved himself a vigorous and extraordinarily controversial commander in chief when he ordered the U.S. Army to crush the Great Strike of 1877. Despite the fact that troops were serving without pay due to the failure of Congress to pass a new appropriations bill, the new president ordered the troops into action against their fellow citizens. The strikers fared no better under the first Democrat elected since the Civil War. Democrats advocating states' rights were astonished when President Grover Cleveland sent in the army in 1894 to break up the Pullman Strike, citing federal authority over mail routes. It was the last time the army would be used to break up strikes, although state National Guard units were occasionally called out to quell violence between strikers and strike breakers.

William McKinley made effective use of specialized staff services and modern communications. He opened the first war room of the White House and followed very closely the actions of his army and navy infighting over the conduct of the war against Spain in 1898. It was McKinley who made the major strategic decisions, often overruling or ignoring his senior generals. His weakness was in allowing an ineffective secretary of war to continue in office. Despite this shortcoming, McKinley made important institutional changes, foremost among them being the creation of the 11-member Navy General Board in 1900. McKinley's successor, Theodore Roosevelt, took a keen interest in military affairs, which was natural given his background as assistant secretary of the navy and leader of the Rough Riders during the Spanish-American War. Roosevelt's deep involvement in directing the nation's foreign policy also dictated an expansive use of his power as commander in chief. To safeguard the Open Door to China, the president dispatched America's "Great White Fleet" on an around-the-world tour, designed in part to deter Japanese expansion in Asia. To protect the Panama Canal, construction on which began in 1904, Roosevelt announced his corollary to the Monroe Doctrine, which warned European nations not to intervene in Latin America to restore order. Instead, that job fell to the United States, and as president, Roosevelt repeatedly dispatched U.S. forces to the Caribbean.

Woodrow Wilson, who led America during World War I, did not share Roosevelt's interest in military affairs, but he did share Roosevelt's concern for protecting American interests, which in turn

led the president to stretch his authority as commander in chief. Under Wilson, the United States occupied both Haiti and the neighboring Dominican Republic, and on two occasions, the 1914 occupation of Veracruz and the 1916 dispatch of General John J. Pershing and an American expeditionary force of 10,000 men, the president sent the U.S. military deep into Mexico.

In the run up to World War I, Wilson championed civilian control over the military and was outraged to learn that the army had made war plans should the nation enter the European conflict. Wilson denuded the Army-Navy Joint Board and fired his secretary of war, who was too active in preparing for war. Wilson's new secretary of war, Newton Baker, a pacifist, was effective in building the camps and mobilizing draftees after May 1918, but he too avoided all strategic discussions and decisions. Wilson only met with General Pershing once and, in effect, turned over all of the major military decisions to him. Meanwhile, the secretary of the navy was a politician uninterested in naval affairs, so the unusually dynamic assistant secretary of the navy, young Franklin D. Roosevelt, took charge of a highly efficient Navy Department. Roosevelt, however, seldom had an opportunity to talk to Wilson.

World War II and the Cold War

Franklin Roosevelt, thanks to his experiences in World War I, knew more about warfare than any president since his distant cousin Theodore; he was especially favorable toward the navy. Despite the nation's heavily isolationist mood in the mid-1930s, Roosevelt used relief spending to strengthen the navy yards and build warships. The navy secretly developed long-range submarines that could engage in unrestricted warfare against the Japanese merchant fleet—exactly as the Germans had done against the British in World War I. When Roosevelt learned about it in 1938, he seized upon submarines as a war-winning weapon that enabled him to threaten Japan. Within hours of Pearl Harbor, he had issued orders for unrestricted submarine warfare against Japan—exactly the same policy as that of Germany in 1917. Roosevelt was also an enthusiast for air power, pushing for an expansion of the Army Air Corps and supporting increased production infrastructure that ultimately produced more than 300,000 warplanes during the course of the

war. During the war, Roosevelt adopted McKinley's practice of having a war room—now called the map room—and consulted daily with his chief of staff, Admiral William Leahy. Roosevelt made sure he had the final say in every significant decision involving the army and air force, and relations with Britain and Russia as well. He was less successful with the navy, where Admiral Ernest King kept his secrets and his strategies to himself, even to the point of not asking for British aircraft carriers, which were needed in the battle of Midway. Over at the War Department, Secretary Henry Stimson had his own secrets and took full control of developing the atomic bomb.

Vice President Harry Truman was kept totally ignorant about the war plans until the day he became president. Even as president, he had a very weak White House staff and could not counter Leahy (who represented the Pentagon's position) or Stimson. In the emerging Cold War after 1947, including the creation of the North Atlantic Treaty Organization (NATO) in 1949, Truman largely ignored the new Defense Department and, instead, closely followed the advice proffered by the State Department, especially Dean Acheson. Thus, it was Acheson's recommendation to send American troops to defend Korea in June 1950 that Truman adopted without consulting his National Security Council, the Central Intelligence Agency (CIA), the Defense Department, or the Joint Chiefs of Staff. In the actual fighting of the war, Truman made few decisions, but his failure to get formal approval from Congress and instead rely on UN authorization proved disastrous. When the war turned badly after the Chinese invaded in late 1950, Truman's support in Congress and in public opinion disintegrated. Despite his slide in the polls and the concomitant drop in political power, Truman reinforced civilian control and the president's authority as commander in chief at a pivotal moment in the republic's history when he relieved Douglas MacArthur of his command in Korea. MacArthur's repeated public threats to expand the war and his open letter to Republican House Minority Leader Joseph Martin criticizing Truman's Eurocentric foreign policy and calling for a second front to be opened on the Chinese mainland by Nationalist Chinese leader Chiang Kai-shek doomed the general. Although the president received the backing of the Joint Chiefs of Staff as well as Secretary of State Acheson and Secretary of Defense George C. Marshall, his decision resulted

in demands from leading conservatives for his impeachment, as well as a sharp drop in his approval ratings. Although publicly unpopular at the time, the president's decision eventually won widespread acceptance and even admiration.

Truman's successor, Dwight David Eisenhower, had the experience and prestige to handle all major military decisions himself, including the threat to China to use nuclear weapons unless the country came to peace terms in Korea. Always worried about excessive government expenditures and the mounting national debt, Eisenhower dismayed his top generals by cutting back on land forces and relying more heavily on nuclear weapons. He rejected the advice of the Joint Chiefs to give military support to France, as it was losing its war in Indochina in 1954, but helped, starting in 1955, to nurture the infant, noncommunist state of South Vietnam. Saving this new state was left to his successors.

John F. Kennedy's presidency began with the ill-fated decision to try to overthrow the communist regime of Fidel Castro. In 1961, he approved the CIA plan to invade Cuba, only to be humiliated at the Bay of Pigs. The following year, Kennedy forcefully confronted the placement of nuclear missiles by the Soviet Union on Cuba soil by fully mobilizing American conventional and nuclear forces. Kennedy asserted his authority as commander in chief and overruled his military advisors, who sought a preemptive strike on Cuba. Instead, Kennedy imposed a naval blockade and pressed for a diplomatic solution that led to the removal of Soviet missiles and averted a war that could have quickly escalated into a nuclear one.

Convinced that the application of modern American technology and know-how could destroy the insurgency in South Vietnam, he sent in 16,000 military advisors along with CIA operatives. Kennedy and his brothers were enamored of the idea of special forces serving as the new warrior to confront the threat of communist insurgencies. The Green Berets would be imposed on a reluctant army that, apart from the paratroopers, opposed the concept of diverting resources to special forces and questioned their effectiveness.

Kennedy's goal was to build up the South Vietnamese so that they could win their own war. Lyndon Johnson did not want a war in Vietnam because it would seriously distract him from his primary goal of funding the Great Society at home.

But he could not pull out, because he was committed to a policy of containment, which allowed the communists to take the initiative where the Americans were weakest, as in Korea and Vietnam. Johnson feared that the alternative was the rollback strategy of Barry Goldwater, which risked nuclear war. To avoid the risk of another Douglas MacArthur, Johnson personally selected the generals and created a complex system of divided command, so that no one was really in charge except for himself and Secretary of Defense Robert McNamara. Keenly aware of Truman's mistake in 1950 in not getting congressional approval, Johnson used a thin episode at the Gulf of Tonkin in 1964 to secure near-unanimous congressional approval for whatever military actions he took. The result was an extreme micro-management that allowed Johnson and McNamara to bypass the generals. The service chiefs came close to resigning in protest, but Johnson had shrewdly picked the men least likely to do so. When the Tet Offensive destroyed public support for the war, Johnson was forced to end his reelection campaign. Almost two decades later, Congress, instituting the lessons learned from Vietnam, permanently blocked a president from emulating Johnson by passing the Goldwater-Nichols Act of 1986, which requires that all military orders go from the president to the secretary of defense and then to the Joint Chiefs of Staff, which has direct command of all operations. No end runs or tangled lines of command are allowed. The chairman of the Joint Chiefs, appointed by the president to a 2-year term with the approval of the Senate, is now the principal military advisor to the president, the National Security Council, and the secretary of defense and has to approve all military operations.

To bring a military solution to the war, Richard Nixon expanded the war to Cambodia and, in 1969, ordered the secret bombing of Cambodia without informing either Secretary of Defense Melvin Laird or Congress. In 1970, Nixon sent ground forces into Cambodia, and Congress responded by placing strict limits on the deployment of American troops to that country. Nixon also championed Vietnamization, a program that turned the fighting over to the South Vietnamese army. Finally, in 1973, Nixon signed a peace agreement with North Vietnam, recovered the captured prisoners of war, and brought the military home. Nixon made secret promises to Saigon based on his powers as commander in chief, but they

became void when he resigned in 1974. Nixon also used his powers as commander in chief to suspend the draft, moving the country to an all-volunteer force. Nixon's conduct of the war quickly produced a congressional backlash against the "Imperial Presidency," and Congress passed the War Powers Act, designed to limit the president's powers as commander in chief. There have not been direct confrontations over the War Powers Act, but every president has regarded it as unconstitutional. Thus, when Ronald Reagan used his war powers to invade Grenada in 1983, he covered his international position by gaining the approval of the Organization of Eastern Caribbean States (the regional defense organization), and he was careful to strictly abide by the terms and timetable of the War Powers Act.

Ronald Reagan's most controversial role in expanding the power of the president as commander in chief would be his conduct of relations with Iran. Despite a public pledge that the United States would not negotiate with terrorists, Reagan authorized the United States to sell arms to the Iranian regime, in part to secure the release of American hostages held in Lebanon by Iran-supported terrorists. The sale of arms to a regime that, only a few years prior, had taken over the U.S. embassy and held Americans hostage remains in hindsight perplexing. The United States had discreetly supported the Iraqi regime of Saddam Hussein in its war against Iran that began in 1980.

To carry out the Iranian policy, the administration bypassed the State and Defense Departments and relied on the national security advisor to execute the policy. Funds derived from the sale of arms to Iran were funneled to support the Contra rebels, who were seeking to overthrow the Sandinista regime in Nicaragua. These actions were undertaken to circumvent congressional restrictions placed on funding the Contras. The disclosure of the arms sales in 1986 led to a major public scandal that resulted in both congressional hearings and the establishment of independent counsel to investigate the affair. While the Iran-Contra scandal tarnished many reputations, the president remained popular, as did his vice president, who won a convincing election of his own in November 1988.

Post-Cold War to the Present

The collapse of the Berlin Wall in 1989 and the end of the Cold War led to heady talk about the end of

history and calls by President George H. W. Bush for a new world order. A peace dividend did emerge as a result of the end of the Cold War, but before the U.S. military downsized significantly, it would be deployed in 1991 in a major conflict against Iraq. In 1990, President George H. W. Bush responded to the Iraqi invasion of Kuwait by quickly deploying American troops to Saudi Arabia and gaining UN sanction to expel Iraq from Kuwait (and he asked Congress to vote approval). The euphoria generated by America's quick victory lifted the president's poll numbers but had dissipated by November 1992 to make George H. W. Bush a one-term president.

His successor, Bill Clinton, would be the first president since Franklin D. Roosevelt who had not served in the military. An opponent of the Vietnam War in his youth, Clinton faced significant opposition within both Congress and the military to his efforts to implement a campaign promise to eliminate the exclusion of gays and lesbians from the armed forces by issuing an executive order. Forced to compromise with the opposition, Clinton signed congressional legislation that established "Don't Ask, Don't Tell," which permitted both gays and lesbians to serve in the armed forces provided they remained secretive regarding their sexual orientation.

In terms of foreign policy, Clinton faced significant murmuring among senior military commanders regarding possible intervention in Yugoslavia. Clinton, responding to public unease regarding overseas military involvement in his first years in office, did prove cautious about foreign conflicts. Although the United States maintained a continuing presence in the Persian Gulf in conjunction with Great Britain in order to contain Iraq, primarily by using American air power to enforce a "no fly zone," it did not deploy American troops to participate in UN operations. Clinton withdrew American troops from Somalia after a raid to capture a Somali warlord ended disastrously, and the United States did not intervene to prevent the genocide in 1994 in Rwanda.

The Clinton administration, while reluctant to put "boots on the ground," would over the course of the presidency make greater use of American power. In 1995, American air power in conjunction with NATO would help encourage diplomatic settlement of the conflict in Bosnia. Even more decisively, the Clinton administration, together with NATO, responded with an air offensive in response to the Serbian invasion of Kosovo in 1999.

In the area of terrorism, the United States faced a series of attacks from radical Islamists during the Clinton presidency, including the bombings of the World Trade Center in 1993, the American embassies in Tanzania and Kenya in 1995, and the naval vessel *USS Cole* in 2000. More successfully, the U.S. Custom Service in 1999 managed to apprehend a group of terrorists on the Canadian border who meant to unleash a major attack in Los Angeles. In terms of domestic terrorism, a federal office building in Oklahoma City would be firebombed by Timothy McVeigh, a right-wing extremist.

The Clinton administration's response to terrorism was to seek additional funding to strengthen American intelligence and law enforcement to deal with this threat. Although Congress did provide additional funding, it often approved it grudgingly, and there was little sense of urgency in political discourse. For instance, Clinton ordered unsuccessful missile strikes to kill al Qaeda leader Osama bin Laden and other al Qaeda targets in Sudan and Afghanistan. Republican critics in Congress declared that these attacks were politically inspired to divert attention from the looming scandal involving Clinton's intimate relationship with Monica Lewinsky. For instance, Senator John D. Ashcroft of Missouri, who later served as attorney general under George W. Bush, declared that there "there is a cloud over this presidency," and Senator Dan Coats called for Clinton's resignation over this failed attempt to kill bin Laden.

George W. Bush, when running for president in 2000, criticized Clinton's foreign policy for being too ambitious and asserted that the United States must get out of the business of nation-building. Neither Bush nor his opponent, Vice President Al Gore, centered their campaigns on issues of terrorism or national security. As president, George W. Bush's public agenda in his first few months in office centered on implementing tax cuts and the question of stem cell research.

The terrorist attack against the United States by al Qaeda on September 11, 2001, had a profound effect on the United States. A small group of al Qaeda terrorists had managed to hijack four airliners and crash three of them into the twin towers of the World Trade Center and the Pentagon. The response to this attack would be a remarkable show of public support for the Bush administration and Congress, which expanded presidential powers to

combat terrorism through the USA PATRIOT Act. Moreover, Americans, joined by a number of allies, would quickly strike at Afghanistan, which had harbored al Qaeda.

The Bush administration took an expansive view of presidential authority as a result of what it termed the Global War on Terrorism. For instance, the administration unilaterally declared that the Taliban would be treated as enemy combatants and denied the rights of prisoners of war under the Geneva Conventions. To house enemy suspects and to limit the authority of the federal courts (unsuccessfully in the end), it established a prison in the American base in Guantanamo, Cuba. Bush exerted an expansive view of presidential powers in terms of the right to abrogate the Geneva Conventions and other treaties the United States had ratified. The administration insisted that the Constitution allowed the president to establish military tribunals to try terrorist suspects without congressional assent. Moreover, the administration often bypassed the Federal Intelligence Court to authorize extensive electronic surveillance of Americans. Although George W. Bush publicly claimed that the United States was not in the business of torture, water boarding and other interrogation practices were permitted, which critics insisted violated international and American law regarding the treatment of prisoners held in U.S. custody.

In 2003, the Bush administration argued that the United States must go to war with Iraq on what proved to be the erroneous assumption that it was developing weapons of mass destruction, as well as the claim that it had allied itself with al Qaeda. The Bush administration orchestrated a successful campaign to build support for military intervention that included leaking inaccurate reports of Iraqi nuclear capabilities to *New York Times* reporter Judy Miller. Critics of the policy faced retribution. For instance, when Ambassador Joseph Wilson challenged claims that Iraq was purchasing uranium in Sudan, his wife's service as a CIA agent was revealed to the media by Vice President Richard Cheney's chief of staff. George W. Bush was able to gain official congressional approval for his invasions of Afghanistan in 2001 and Iraq in 2003. In contrast, despite the best effort of Secretary of State Colin Powell, the United States could not convince skeptical allies, most notably France and Germany, to support the United States at the United Nations Security Council. Although the Bush administration

managed to assemble a coalition of the willing that included significant troop commitment from Great Britain, a number of nations that had committed troops to the Persian Gulf War and Afghanistan refused to support the war in Iraq, most notably Canada and France.

Civil-military relations deteriorated over the course of the Iraq War. Bush's domineering defense secretary, Donald Rumsfeld, trying to curtail costs, did little planning for the postwar occupation and used far too few troops, as a massive insurgency threw Iraq into chaos with the deaths of thousands of Americans and many thousands of Iraqis. Furthermore, Rumsfeld tried to dominate the Joint Chiefs, and they pushed back. Bush kept Rumsfeld too long, and only when he left was it possible to use a surge strategy, as formulated by General David Petraeus. Robert Gates, former director of the CIA, replaced Rumsfeld and did much to restore relations between the civilian and military leaders.

The enthusiasts who voted for Barack Obama in 2008 expected him to radically change American military policies just by using his powers as commander in chief. In practice, the changes were small. Obama followed the Bush timetable in shutting down the offensive operations in Iraq in 2010, while continuing a large presence with the mission of training the Iraqi forces. Obama initially retained Bush's secretary of defense, Robert Gates.

As a candidate, Obama had complained that the Bush administration overemphasized Iraq to the detriment of the more important and more legitimate conflict against the Taliban in Afghanistan. As president, he alienated his political base by escalating the war and putting Bush's surge strategist, General Petraeus, in charge of a surge in Afghanistan in 2010. Obama's announced long-term goal was to strengthen the Afghans so they could win their own war. The failure of the Obama administration to close Guantánamo or to bring criminal charges against senior officials who supposedly concocted false information to invade Iraq in 2003 disappointed and even angered sections of Obama's liberal base. Obama had greater success in changing the "Don't Ask, Don't Tell" policy and managed to gain congressional approval in late 2010 to allow gays and lesbians to serve openly in the military. In terms of style, Obama made it a point to regularly visit military bases to boost morale and hold special functions at the White House honoring American

active-duty personnel, and First Lady Michelle Obama has sought to bring attention to the needs of military families.

Although the Obama administration did remove all forces from Iraq, he has, like his predecessors, taken an expansive view of presidential powers in the area of national security.

He aggressively used drone technology to kill individuals deemed terrorists in Pakistan and Yemen. American forces, while not in combat, backstopped the NATO attacks that toppled Libyan leader Muammar Qaddafi. Perhaps the biggest success of the Obama presidency was the killing of Osama bin Laden in Pakistan in 2011. Bin Laden had eluded the United States for nearly 10 years following the attack on the World Trade Center. Obama personally ordered the attack on bin Laden despite the warning from civilian and military advisors that risks of failure were great. The killing of bin Laden did not end the threat of terrorism or al Qaeda, but it certainly represented a crucial turning point.

Conclusion

While presidential command over the nation's armed forces has remained inviolate since the birth of the republic, the degree of control that individual presidents exercise has waxed and waned. At times, this shifting measure of control is the result of personal temperament and experience, while at other moments it reflects political realities or lessons learned from past administrations.

PRISONERS OF WAR

Prisoners of war (POWs) are combatants or civilians captured by enemy troops during a conflict. International law sets standards for defining POWs and ensuring that those captured are treated humanely; those laws have been revised and expanded significantly during the past century, usually in response to large-scale atrocities or abuse. During wartime, it is often difficult to ascertain whether opposing forces are treating POWs humanely, so international bodies such as the Red Cross are entrusted with inspecting camps, prisons, and other facilities to confirm that international humanitarian law (IHL) is being followed. When IHL violation occurs, individuals, organizations, armies, or governments may be prosecuted in their respective national or international courts.

Laws Regarding POWs

Under customary laws of war that developed over the course of the early modern era, POWs were entitled to humane treatment by their captors. Often, sharp distinctions were made between officers and enlisted men. For instance, the Americans and the British during the American Revolution regularly paroled officers and allowed them to return to their homes if they agreed not to take up arms. Exchanges of POW officers between enemies were also common. The treatment of the enlisted ranks could be less benign; for instance, scores of common soldiers held by the British during the American Revolution faced ghastly conditions aboard prison ships anchored in New York Harbor. The distinction between officers and enlisted personnel continues to

exist in international law—enlisted personnel can be compelled to work while officers are exempted.

During the Civil War, both sides routinely paroled or exchanged captured POWs. As the war progressed, the Union Army halted prison exchanges and paroles to deprive the Confederacy of badly needed manpower. As a result, death rates soared in the prison camps in the South and North. Conditions were the worst at the Confederate camp in Andersonville, Georgia, which lacked adequate potable water or any type of shelter, and provided starvation rations. After the war, Henry Wirz, the commandant of the camp, was tried and convicted by a Union court-martial for violating the laws of war and was hanged.

During the second half the 19th century, there emerged an effort to codify and build on customary laws of war, beginning with the establishment of the International Committee of the Red Cross and the First Geneva Convention (1864).

The 1907 Hague Convention (Hague IV) set standards for determining who qualified as a protected combatant and ordered that they be treated humanely. The Convention emphasizes parity: Countries are allowed to use enemy combatants as a labor force, though they must be paid at a rate comparable with that country's own soldiers. POWs must also be provided living conditions on the level of a country's own soldiers and are entitled to their personal property, wages, and religious freedom. Also included in Hague IV are rules requiring an office of inquiry (for information on a particular prisoner) and aid worker access to the POWs. Following the conclusion of hostilities, prisoners are to be repatriated quickly.

Though the Hague Conventions established the basic standards for the treatment of enemy POWs, World War I encouraged many nations to further codify humanitarian principles in order to better protect POWs. In the wave of international law written after 1918, the Third Geneva Convention in 1929 (which would be updated in 1949) expanded on Hague IV's laws regarding POWs, particularly with regard to the individuals covered by these laws. Certain civilians were now protected, including those who accompany armies without serving as combatants, merchant marine crews, and civil aircraft crews. Torture was explicitly banned in the Convention. Most important, though, the Third Geneva Convention indicated that humane

treatment of prisoners was the responsibility of the government in power, not the individuals or individual units that are more directly in control of prisoners. It further granted these rights to prisoners of all nations, not just those whose countries of origin were parties to the convention.

The enormous scale of inhumane behavior during World War II resulted in the first major international war crimes trials, as well as further expansion of the accepted laws of war. Along with the Nuremberg Principles, which established legal precedent for international prosecution of war crimes (including inhumane treatment or murder of POWs), the post-war establishment of the United Nations created an international body that would also expand humanitarian law. The Fourth Geneva Convention in 1949 updated the rules governing POWs from the 1929 conventions.

The 1996 War Crimes Act defines a war crime as a grave breach of Geneva Convention protocol. The relationship of the Global War on Terror to international humanitarian law is more vague and controversial and is discussed later in this entry.

One of the main qualifiers for humane treatment of POWs is the notion of reciprocity. Between two enemy nations, the expectation of the opposing side's behavior dictates how POWs are treated: If an army assumes that its own men are being treated fairly by the enemy, it will usually treat that enemy's prisoners in a similar manner. A major motivating factor in committing war crimes against POWs (particularly in the 20th century) is racial or ethnic prejudice, as seen in many countries during World War II and in civil conflicts (such as the Yugoslav Wars) across the globe. The International Committee of the Red Cross continues to act as a neutral, third-party observer, monitoring activities related to POWs worldwide.

POWs in the 20th Century

The experience of POWs is difficult even under the best circumstances. Captivity that can stretch from months to years can lead to feelings of helplessness and depression. Even when a country holding POWs adheres to international humanitarian precepts codified by the Hague and Geneva Conventions, conditions, especially for enlisted personnel, can be austere, especially with regard to diet and housing. Americans held captive have, at times, managed to

escape and elude recapture, but often this option is not feasible for the vast number of prisoners held deep within enemy territory.

World Wars I and II

Americans held captive in World War I and World War II fared relatively well. In both conflicts, the German government adhered to international agreements regarding the treatment of POWs. This proved especially important in World War II since it gave American POWs regular access to Red Cross packages containing food to supplement the rations supplied by their captors and provided for regular inspections by the International Red Cross. Abuses did occur; some American Jewish POWs were persecuted, a group of soldiers captured during the Battle of the Bulge was summarily executed, and some Americans who staged an escape from Stalag Luft III were executed after their capture. At the end of the war, scores of American POWs were force-marched from prison camps in eastern Germany to avoid their liberation by the Soviet Union. Despite these incidents, only 1% died in captivity. The humane treatment of American POWs is one of the great successes of the Hague and Geneva Conventions, and it stands in sharp contrast to the genocidal policies of the German government aimed at Jews and the Roma.

Soviet troops captured by the German army suffered grievously. The German army began the war with orders to execute all political commissars on capture. Although the German army did take millions of Soviets captive, death rates in German POW camps were staggering, with more than 60% of Soviet prisoners dying by the end of the war. The Soviet Union also did not adhere to international humanitarian standards, and conditions were harsh for the German captives. The vast majority did not survive captivity, and those who did were not released until 10 years after the war.

Americans held captive by the Japanese were treated brutally, along with prisoners from other Western countries. Japan did not adhere to the Geneva Conventions, and the Americans routinely suffered from inadequate food, poor sanitary conditions, and lack of proper medical care. A group of Americans held in China were even subjected to a series of medical experiments. Torture and summary execution were routine and random, especially

for prisoners trying to escape. The forced march of American POWs captured after the fall of Bataan in 1942 led to hundreds of death from summary execution. The Japanese did permit some shipment of Red Cross packages to prisoners and limited exchange of correspondence with families at home. As a result of these conditions, nearly one quarter of the American POWs held by the Japanese perished.

The United States did not maintain any prison camps during World War I, but it established a large network in the United States during World War II, in the end holding more than 378,000 captives from Germany and a much smaller number from Japan. The United States adhered closely to international obligations regarding the humanitarian treatment of these prisoners, and as a result, most of the captives remained complacent during their captivity. Some scholars argue that the good conditions German POWs received aided the process of reconciliation after the war. In fact, a significant number of German POWs later emigrated to the United States.

Controversy remains regarding American treatment of German POWs after the war ended. With the unconditional surrender of Germany in 1945, the United States stripped German POWs of the traditional protections afforded by the Geneva Conventions and declared them Disarmed Enemy Forces. Some scholars have charged Dwight D. Eisenhower with deliberately killing German POWs, but evidence suggests that the American authorities were overwhelmed by the tasks they confronted in occupying a devastated nation and by their responsibility for millions of German POWs. Moreover, the American occupation authorities paroled scores of German POWs who were not associated with the Schutzstaffel or suspected of committing war crimes.

The American perception of World War II as the “good war” permeated popular culture when the war ended, and the enthusiastic reception given to former POWs often conflicted with the soldiers’ own coping mechanisms. Popular films about World War II POWs, such as *Stalag 17*, *Bridge on the River Kwai*, and the *Great Escape*, made former prisoners uncomfortable with their glorified depiction as heroes; such films depicted very little of the day-to-day life in internment camps accurately. Dramatic depictions of resistant, wily Americans with know-how outsmarting befuddled foreign enemies became the popular narrative, providing little support to

actual former POWs, who had no real outlet where they could discuss some of their less glamorous struggles with guilt or depression after the war. Frank, public discussion of POW suffering would not emerge until after the Vietnam War.

Following the unspeakable atrocities committed during World War II, Allied military tribunals for Germany and Japan made POW abuse a major charge leveled against accused war criminals from the two defeated powers.

The Korean War

Despite the Nuremberg and Tokyo war crimes trials and major postwar attention to the plight of abused POWs, the Korean War would prove incredibly brutal, especially for UN POWs. Korean War POWs suffered tremendous casualty rates, and many American soldiers were tortured, starved, or murdered in Chinese prison camps.

Official statistics reveal that 2,701 of the 7,140 American POWs died in captivity, though many historians believe that the number may be much higher due to atrocities committed immediately after capture. McCarthyism on the American home front, combined with the cultural notion that American POWs were Chinese collaborators (popularized by the journalist Eugene Kinkead and the 1954 Ronald Reagan film *Prisoner of War*), made repatriation difficult for the former prisoners. Popular discourse focused on brainwashed POWs; and the fact that 21 prisoners defected to China at the end of the war became a journalistic fixation. Instead of happiness and warm welcomes, many former POWs were interrogated about their political beliefs, the torture they experienced, and their sexuality immediately on boarding ships back to the United States, where they were further interrogated by military intelligence. In Lewis Carlson's *Remembered Prisoners of a Forgotten War*, interviews with Korean War POWs reveal a sense of frustration felt during their adjustment to civilian life and anger over the chilly reception and distrust they experienced on returning to America.

The question of the status of POWs complicated the ending of the Korean War. Although the Geneva Conventions called for repatriating all POWs to their country of origin, during the armistice negotiations the United States and the United Nations pushed to allow North Korean and Chinese prisoners the option of remaining in South Korea. Communist

negotiators initially rejected this demand, prolonging the war until a compromise was reached. A neutral repatriation commission was established to interview prisoners who wanted to avoid repatriation. Thousands of communist prisoners, and—to the consternation of American leaders—21 U.S. prisoners opted to remain.

In response to the alleged collaboration of American POWs in Korea, the United States issued the U.S. Military Code of Conduct. This code stressed the importance of Americans held captive avoiding collaborating with the enemy and divulging military information. Unrealistically, the code mandated that an American POW should only provide name, rank, and serial number during interrogation.

The Vietnam War

During the Vietnam War, most of the Americans captured were aviators engaging in bombing missions over North Vietnam. North Vietnam refused to adhere to the Geneva Conventions and denied prisoners' access to the International Red Cross. American POWs endured harsh treatment, including torture, and were forced to take part in propaganda broadcasts denouncing the American war effort. The United States did accord POW status to the captured North Vietnamese troops, and these prisoners generally received treatment in accordance with the Geneva Conventions. Vietcong guerrillas generally did not receive these protections and often faced abuse, especially if turned over to the South Vietnamese authorities.

The Persian Gulf War

A small number of Americans were captured during the Persian Gulf War in 1991. Although Iraq was a signatory of the Geneva Conventions, American prisoners were tortured, and two women prisoners were sexually assaulted. In contrast, the ground war against Saddam Hussein in 1990 left the U.S. and allied forces woefully unprepared for the influx of prisoners. Iraqi prisoners taken during the war were quickly released.

POWs Post-9/11

Since the start of the Global War on Terrorism, the United States has made important distinctions between lawful and unlawful combatants. As the enemy in that conflict is a nebulous entity and not a

sovereign nation, the United States has declared that captured terrorist suspects are not eligible for the same rights as traditional combatants. The public and international debate over the Guantanamo Bay prison stems from this distinction, as the detainees there are often held indefinitely with no due process. Secret Central Intelligence Agency prisons further complicate the relationship of the United States with international law.

The 2004 Abu Ghraib prisoner abuse scandal brought a number of issues regarding POWs and humane treatment to public attention. Images of prisoners held by the United States being abused by the military police in an Iraqi prison were released, eventually resulting in the disclosure of myriad government documents detailing questionable interrogation techniques and official approval. Ultimately, it became clear that although only a handful of soldiers participated in the abuse itself, the chain of command had failed to stop the torture while it was occurring. While the George W. Bush administration maintained that terror suspects were unlawful combatants, government documents revealed that Bush administration officials decided that interrogation techniques constituted torture only if they caused pain equivalent to organ failure or death. Congress passed the Detainee Treatment Act of 2005 and the Military Commissions Act of 2006, which attempted to authorize Guantanamo detentions and take away the U.S. Supreme Court's authority to review detainees' habeas corpus rights.

A number of legal cases arguing against the validity of the U.S. policy on unlawful combatants have been decided in recent years. In one of the more famous cases, *Hamdan v. Rumsfeld* (2006), the U.S. Supreme Court found that the United States had violated the Geneva Conventions at Guantanamo Bay in both its classification of individuals as unlawful combatants and in its use of military commissions instead of civilian trials. The Court held in *Hamdan* and in *Boumediene v. Bush* (2008) that, while inmates could (and should) be tried by military commissions, independent review by Article 3 judges had to be available and basic procedural safeguards had to be respected. However, the United States has exempted itself from compulsory judgment at the International Criminal Court and conducts many of these operations in secret (i.e., away from Red Cross observation), so there have been no international legal consequences for the United States, despite a

Red Cross report detailing the abuses at Abu Ghraib and international outrage over Guantanamo Bay.

Conclusion

While the 20th century saw the proliferation of international humanitarian law and new regulations regarding humane treatment of POWs, war crimes against prisoners continue to this day. However, thanks to new international bodies formed after World War II, there now exists a global legal framework for prosecuting war criminals. Due to the obvious difficulties in policing an enemy's treatment of a country's combatants, the Red Cross works to maintain proper standards of care for POWs. With the changing climate of the Global War on Terrorism, though, loopholes in international law have been exploited and are often difficult to identify or prosecute, as has been the case with many recent abuses of IHL.

PRISONS, MILITARY

Military prisons have a grim reputation. James Jones's description in his novel *From Here to Eternity* of the life of prisoners in a U.S. Army confinement facility during World War II and Kenneth H. Brown's gritty play *The Brig* from the Vietnam era are well-known literary accounts. The reality has largely been different. Military prisons have stressed rehabilitation and, in some cases, at least, a return to military duty rather than simply the administration of punishment. The extent to which rehabilitation may lead to continued military service has varied over time, however, and is likely to vary in the future. This entry discusses the history and types of U.S. military prisons and provides details on the prison population.

Background

During large-scale conflicts, such as the World Wars, the armed forces have needed to move as many men as possible from confinement to ordinary military duty, owing to heavy casualties. Confinement has necessarily been severe enough to discourage military personnel from using imprisonment as a way to avoid the battlefield. This problem was briefly highlighted shortly after World War II when the commanding officer and some other cadre members of the 10th Reinforcement Depot in Lichfield, England, were court-martialed for allegedly abusing prisoners at the confinement facilities that were part of the depot. The punishments they received were light, and the army thus seems to have acknowledged the need for ensuring that reluctant soldiers were returned to duty.

When retaining personnel is less of a priority, the armed forces can be more selective in deciding which prisoners can return to active duty. Therefore, a relatively high percentage of former prisoners will be discharged after punishment. In recent years, despite shortfalls in recruiting, there has been less stress on keeping former prisoners in the military services than during the World Wars.

In some spheres, military prisons have been highly innovative. Vocational training for prisoners, for

example, was pioneered by military prisons before being introduced in civilian institutions. Moreover, armed forces prison staffs have maintained close relations with the American Correctional Association and have worked actively to receive certifications from that organization for themselves and their institutions. To improve their rehabilitation services, military prisons are employing various categories of specialists, including many civilian employees.

Military prisoners can win parole under specified circumstances. The army, navy, and air force have parole boards, and there is a Department of Defense Corrections Council that deals with policy issues and the oversight of the parole system. Once they leave prison, parolees are the responsibility of the nearest U.S. Probation Office. If they violate the conditions of their parole arrangements, former prisoners are subject to an extension of their paroles. Not many military parolees have to be returned to prison, however.

The nature of the crimes for which service personnel have been imprisoned has changed significantly in recent years. Until the institution of an all-volunteer force, the majority of prisoners had been convicted of or were awaiting trial for military offenses, such as desertion or disrespect to superiors. Gradually, the numbers of ordinary crimes, such as drug offenses, that were committed by service members surpassed specifically military offenses, thus making military prison populations more like those of civilian confinement facilities.

The Evolution of Military Prisons

During the first century or so of the U.S. armed forces, punishments were frequently cruel, as judged by current standards. The objective was largely to inflict unpleasant, but short-term, penalties that would permit returning offenders to duty quickly. Such penalties included flogging and branding, as well as less painful, but thoroughly humiliating, sanctions. There was no real system of imprisonment for military offenders until the Civil War, and consequently, most of them were placed in civilian confinement facilities. The huge mobilization of men between 1861 and 1865 required a more structured approach. The Union Army established several confinement facilities, such as the Old Capitol Prison in the District of Columbia and, perhaps most notably, Fort Jefferson in the Dry Tortugas, although civilian

prisons continued to be used. The use of special military prisons lapsed after the Civil War.

Only in 1875 was the first permanent military prison, which was also the first federal prison, established. This was the U.S. Disciplinary Barracks at Fort Leavenworth, Kansas, which was termed the U.S. Military Prison until 1915. Meanwhile, the Portsmouth Naval Prison was established in New Hampshire in 1908. During several relatively long periods, the Leavenworth facility was transferred to federal civilian control, but in 1940, it was given back to the army, which has retained it since then. Privatizing military confinement facilities has been proposed from time to time, but such initiatives have not moved far. One argument for keeping prisons within the armed forces is that the services' experience with the administration of confinement facilities can be highly valuable, because foreign expeditionary operations usually involve the detention of prisoners, whether they are enemy military personnel or civilians who must be interned.

Resistance and Outbreaks of Violence in Prisons

Prison mutinies have been relatively few, but they have often attracted considerable attention. They have usually taken the form of refusals to work rather than attacks on prison staff or others. Soon after World War I, for example, there were two significant work stoppages at Leavenworth. A notable riot occurred at the Fort Dix Stockade, in New Jersey, in 1954. A searching investigation found that one of the problems was the failure to separate minor and serious offenders. The latter often felt that they had little to lose in continuing the disruptive behavior that brought them into the military corrections system.

A far more serious outbreak occurred in 1968 at the U.S. Army Vietnam Installation Stockade, which was better known as the "Long Binh Jail" or "LBJ Ranch." A highly charged racial situation and massive overcrowding led to significant resistance and the destruction of a good part of the stockade. The vast majority of the prisoners were African American, suggesting the existence of institutional racism in the military justice system. As in the Fort Dix riot, insufficient separation between those accused or convicted of lesser and more serious offenses contributed to the problems at Long Binh.

Unrest occurred within confinement facilities in the United States during the Vietnam War era as well. Perhaps the best known example is a confrontation between a relatively small group of prisoners and the stockade administration at the Presidio of San Francisco, which brought highly unfavorable publicity to the military prison system. Other riots occurred at Fort Bragg, North Carolina; Fort Ord, California; and, again, at Fort Dix, New Jersey, in the late 1960s.

Characteristics of Facilities and Numbers of Prisoners

The armed services have established three levels of confinement that are generally comparable between the services and approximately comparable to those found in civilian systems. Level 1 confinement facilities are similar to civilian jails. They hold people who are awaiting trial and those sentenced to no more than 1 year of confinement. Level 2 institutions are intended for prisoners whose sentences run between 1 and 7 years. These are generally equivalent to civilian prisons. The only maximum-security prison in the military system is at Fort Leavenworth, which was designated as such in 1951.

Various terms are used to describe the levels of prisons. *Confinement facility* is used for some air force and army installations, and the word *brig* is employed by the navy and the marines. Major installations for the air force are at Kirtland and Lackland Air Force Bases in New Mexico and Texas, respectively. Similar army facilities are at Fort Lewis, Fort Knox, and Fort Sill in Washington state, Kentucky, and Oklahoma, respectively. The navy maintains the largest number of facilities owing to its widely distributed activities. Brigs are at Charleston, South Carolina; Norfolk, Virginia; and Pearl Harbor, Hawaii, as well as other locations. There are various installations with the designation *detention facilities* in the United States and overseas, including San Diego, California; Sasebo, Japan; and Naples, Italy. There are marine brigs at several bases, including Camp Pendleton, California; Quantico, Virginia; and Camp Lejeune, North Carolina. In addition to administering prisons ashore, the navy has the problem of holding some prisoners, at least for short periods of time, aboard a ship. That has meant that new large ships have had to include sections intended specifically for confinement. Older vessels

have had to make do with ad hoc adjustments for the confinement of prisoners.

Not every prisoner is held in a facility maintained by his or her branch of the armed forces. Some prisoners are transferred to nonmilitary federal prisons for family reasons, for example. Moreover, prisoners may be held temporarily in any military prison pending transfer to one of their own service's institutions.

Military confinement facilities are not all service branch specific. Leavenworth contains prisoners from all the services who are viewed as hard-core offenders. Other prisons have functions that are, at least in part, specialized. The navy, for example, conducts efforts to rehabilitate sex delinquents from all the services at its Miramar and Charleston Naval Consolidated Brigs at San Diego, California, and in South Carolina, respectively.

The air force has relatively few offenders, and its confinement program largely concentrates on retraining prisoners to accept a military environment and to return in due course to duty.

The structure and administration and the size of the military prison system have varied significantly owing to the varying numbers of men and women in the armed services. A serious problem in military corrections that is now being addressed is its dispersed nature. Confinement facilities have been the responsibility of local commanders, who may or may not have devoted much attention and resources to them. Such decentralization seems to have contributed to the retention of inadequate methods for handling prison populations.

Table 1 Numbers of Prisoners Held By Service

	1996	Average 1997–2007	2008
Total	2,747	2,283	1,651
Air Force	487	421	281
Army	1,106	863	701
Marine Corps	685	560	427
Navy	455	423	231
Coast Guard	14	16	11

Source: Adapted from Table 6.64, of "Prisoners Under Jurisdiction of U.S. Military Authorities," *Sourcebook of Criminal Justice Statistics Online*, 2008.

Centralization of policies and oversight responsibility at the service level and continued increasing cooperation between the armed services has proved beneficial. A major step was the creation of the Army Corrections Command at Arlington, Virginia, on October 1, 2007, which, as its title suggests, oversees the confinement facilities of the army. This agency is part of the Office of the Provost Marshall General of the Army. One of its continuing goals is to provide qualified personnel for confinement assignments in overseas operations.

Detailed statistics from the *Sourcebook of Criminal Justice Statistics Online* (<http://www.albany.edu/sourcebook/pdf/t6642008.pdf>) indicate that the numbers of prisoners in military confinement facilities are relatively small. Although there have been variations in the numbers of prisoners detained over approximately the past decade, the general trend has been for decreases for every service (Table 1). The wars in Afghanistan and Iraq appear to have had little effect on confinements.

PROFESSIONALISM

The professional military officer (PMO) represents not only a highly trained and dedicated expert in the field of military science but also a powerful symbol in U.S. culture. Throughout U.S. history, however, advocates of professionalism have often encountered resistance from civilians and politicians as well as career officers. These misgivings were rooted in distrust of standing armies, confidence in the effectiveness of the citizen soldier, assumptions regarding class status, and institutional careerism. This entry looks at the evolution of professionalism in the U.S. military.

The 19th Century

Traditionally, the United States maintained a small military and officer corps. Drawn from their experience as subjects of the British Empire, many Americans believed that professional militaries served as instruments for civilian oppression. As early as 1783, however, leaders like George Washington argued for the need of professionally trained officers and advocated the establishment of a military school. Critics feared that such an institution would create a dangerous class of martial elites that could threaten the primacy of civilian authority. Supporters argued that, as an exceptionally American institution, it would establish a proud officer corps loyal to the principles of democracy and civilian command of the military. In 1802, President Thomas Jefferson signed the law that established the United States Military Academy at West Point. In 1845, Secretary of the Navy George Bancroft established the Naval School, later the United States Naval Academy, at Annapolis, Maryland.

The several military disasters during the War of 1812 (1812–1814) underscored many of the deficiencies in professionalism, and Andrew Jackson's victory over the British at New Orleans enshrined the image of the exceptional citizen volunteer. This

experience led policymakers to rely on the rapid build-up of amateur soldiers (militia, volunteers, and conscripts) to meet wartime exigencies throughout the 19th century. The experience also established a core group of young, staunchly dedicated career officers like Edmund P. Gaines, Alexander Macomb, Winfield Scott, and others. They led modest reforms, including the adoption of a cadre plan in 1821, that maintained a disproportionately large officer corps during periods of demobilization and budget reductions. Certainly the desire to protect their careers partly motivated these officers, but in so doing, they provided the leadership that would oversee the army's constabulary mission on the frontier as well as provide a cadre of PMOs ready to command an expanded military to meet national emergencies.

U.S. military officers fulfilled this role throughout the 19th century. Seemingly, the careerism and elitism exhibited by officers in the decades following the Civil War (1861–1865) confirmed the early concerns about the dangers of creating a cadre of military elites. Garrisoned at numerous posts in the west, for example, Gilded Age officers appeared much more interested in maintaining their upper-class, Victorian lifestyles than in advancing the instruction of their profession. A few individual advocates of reform in professionalism, however, emerged during this time. William Sherman, Emory Upton, and others argued for an expansion in the Regular Army and recommended schools that could offer more specialized education beyond that received at the academies. In 1878, an effort to pass these reforms through Congress failed, stymied as much by a lack of political will as by entrenched officers defending their rank and status. In 1881, nevertheless, Sherman established the School of Application for Cavalry and Infantry at Fort Leavenworth, Kansas, yet the general admitted that during its initial years, the school served as little more than a locus of fraternal socializing for officers arriving from distant outposts. Under the leadership of commandants like Arthur L. Wagner, however, it became an early model of professional military education.

The 20th Century

Although the U.S. forces prevailed during the Spanish-American War (1898), the highly publicized logistical disasters prompted an era of reform and

reorganization. Enacted by the efforts of Secretary of War Elihu Root and inspired by the works of Emory Upton, these changes reflected a growing acceptance of the need for a more professional officer corps. In 1901, the War Department established the Army War College (AWC) and in 1902, the General Service and Staff College. The AWC emphasized historical case studies meant to hone command skills, while the program at the General Service and Staff College introduced field maneuvers to complement classroom instruction. To increase the number of college-educated officers and to draw on the broadened university curriculum, the National Defense Act of 1916 created the Reserve Officers' Training Corps. In 1941, responding to the demands of the rapid mobilization just prior to the Second World War (1941–1945), the U.S. Army created the Officer Candidate School at Fort Benning, Georgia, to quickly train civilians as combat officers.

As in the prior century, military professionalism continued to draw critics. Politicians and civilians all have their specific interests invested in the armed forces, but much of the resistance for improving professionalism during the 20th century also came from the officers themselves. During the era of the Root reforms, some argued that classroom training would create officers who would dogmatically cling to theory at the expense of pragmatic realities. In the public estimation, however, the success of U.S. arms during the Second World War heightened the reputation of the PMO, as exemplified by Dwight Eisenhower, George Patton (United States Military Academy and AWC alumni), Chester W. Nimitz (United States Naval Academy), and others. The image of the PMO reassured Americans during the anxious times of the Cold War. This image, however, suffered as U.S. military fortunes ebbed during the Vietnam War (1965–1975). The appearance of being wedded to doctrine and the use of body count quotas painted PMOs of this era as thoughtless bureaucrats who had lost their warrior edge.

This perceived inflexibility was one of the concerns of a congressional inquiry in the late 1980s. As a result of the Goldwater-Nichols Department of Defense Reorganization Act of 1986, the House Armed Services Committee, chaired by Representative Ike Skelton (D-MO), commissioned a report to address the current state of professional military education. Published in 1989, the Skelton Report called for the need to emphasize joint professional military education to train joint professional

officers who could successfully meet the demands of the late 20th century. Twenty years later, in July 2009, the House Armed Services Committee confirmed the value of joint professional military education but also found that many officers had used it more as a means to enhance rank and promotion than to cultivate strategic thinking, underscoring the enduring tension between professionalism and careerism.

PROPAGANDA

Propaganda is the systematic use of communication to advocate a position or gain compliance. Persuasive in intent, propaganda encompasses a wide variety of both mediated and nonmediated strategies and techniques. This entry defines propaganda and then

discusses propaganda and messaging campaigns from World War I to the present.

Derived from the New Latin phrase *propaganda fide*, meaning “propagate the faith,” the word *propaganda* was initially used in reference to religious conversion. While the word came to be used in many other contexts, it has developed a negative connotation because of its association with totalitarian states and fears of manipulative media effects. Today, propaganda campaigns are rarely referred to as “propaganda,” and more favorable or ambiguous terms, such as *strategic communication* and *psychological operations*, are often used instead.

Yet, regardless of what name it is given, propagandistic communication is commonly used by both governmental and nongovernmental organizations. Like other forms of persuasive communication, propagandistic messages are intended to change the attitudes, beliefs, values, or actions of individuals.

Propagandistic messages can be identified through several characteristics: deliberateness, the presentation of only one side of an issue, the exclusion of arguments that support contrary positions, and the discouragement of evidence-based evaluation.

Propaganda can range from the truthful to the deceitful. At times, the source of propaganda is known; at other times, the source is obscured. “White” propaganda truthfully identifies its source; “gray” propaganda conceals the sponsor; “black” propaganda falsely attributes its source.

Propaganda During World Wars I and II and the Cold War

The U.S. government’s first large-scale propaganda campaign coincided with the American entry into World War I. To build popular support and boost enlistment in the armed services, President

Official U.S. war films (1918) released by the Committee on Public Information

Source: Library of Congress.

Woodrow Wilson formed the Committee on Public Information (CPI) on April 13, 1917. In operation until August 21, 1919, the CPI was responsible for creating a wide variety of propagandistic media that simultaneously extolled “traditional” American virtues and demonized Germany as an aggressor nation. Such media included a daily newspaper, the *Official Bulletin*; a wide variety of booklets, posters, and photographs; and three motion pictures, *Pershing’s Crusaders*, *America’s Answer*, and *Under Four Flags*. Additionally, the CPI launched an ambitious public speaking campaign to reach individuals on a personal level. Known as “4 Minute Men,” the 75,000 CPI speakers came from communities across the country and gave brief, 4-minute pro-war speeches at theaters, churches, fairs, and other public gatherings.

In addition to the CPI, the World War I-era government also spread propagandistic messages within the school system. Led by the Bureau of Education’s Division of Civic and Educational Cooperation, bimonthly bulletins were published and distributed to promote patriotism among students at schools across the country.

These agencies were shuttered at the end of World War I, but America’s entry into World War II again necessitated new campaigns to sell the war and promote American interests. The United States embarked on an ambitious propaganda campaign with the establishment of the Office of War Information (OWI) on June 13, 1942. A large operation, the OWI was responsible for creating and distributing pro-American propaganda for both domestic and international audiences.

Abroad, messages focused on demoralizing the enemy and promoting American military strength. At home, the OWI created radio series, such as *This Is Our Enemy*, *Uncle Sam Speaks*, *This Is War!*, and *You Can’t Do Business With Hitler*. The OWI’s newsreel service, the United News, showcased footage of military equipment, personnel, and battles. Additionally, the OWI provided newspapers and magazines with a steady stream of photographs documenting various aspects of the war effort. Among the lasting legacies of the OWI was the establishment of the Voice of America radio service in 1942, which remains an independent, international broadcast service of the U.S. government.

Toward the end of World War II, the OWI’s domestic influence was curtailed by Congress. The

OWI was terminated on September 15, 1945, and the Smith-Mundt Act of 1948 stipulated that propaganda intended for international audiences not be targeted toward the domestic population. Yet concern about Soviet propaganda soon resulted in the renewal of American efforts and the launch of the U.S. government’s first peace-time propaganda campaign.

After President Harry Truman proposed the launch of what he called a “campaign for truth” in 1950, early Cold War propaganda adopted an aggressive and sensationalistic anticommunist tone. The Psychological Strategy Board was established in 1951 to help America expand its propaganda campaigns further into countries in the Soviet Bloc, Asia, and the Middle East.

The widespread institutionalization of government propaganda demonstrated the way in which the Cold War was a battle of ideas in which public opinion was central. Phrases that referred to the ideological battle between the United States and USSR included “war of ideas,” “struggle for the minds and wills of men,” “thought war,” “ideological warfare,” “psychological warfare,” and “information warfare.”

Under President Dwight D. Eisenhower, the beginning of America’s modern propaganda efforts began to take shape. The new approach adopted after the launch of the U.S. Information Agency (USIA) on August 1, 1953, represented a more refined understanding of propaganda and an awareness that propaganda, as later suggested by Anthony Pratkanis and Elliot Aronson, is most effective as a form of “mass suggestion,” with the “ultimate goal of having the recipient of the appeal come to ‘voluntarily’ accept this position as if it were his or her own.”

In line with this recognition of the limited impact of identifiable propaganda, America shifted toward a more sophisticated public diplomacy model, which involved pairing propagandistic messages with a wide range of additional communication and informational campaigns. Such public diplomacy involved two simultaneous approaches during the Cold War: promoting cross-cultural understanding through cultural and educational exchanges and spreading anticommunist and pro-American messages directly.

The first approach—fostering cross-cultural understanding and international goodwill—included notable programs such as the Fulbright exchange program, the Peace Corps, and the People-to-People

program. All programs encouraged the spreading of a positive image of America by encouraging cross-cultural interaction.

The second approach—spreading anticommunist messages—took more predictable routes and involved a variety of activities, including the launch of two radio services. The first, Radio Free Europe, began broadcasting in 1950, with the initial transmissions reaching Bulgaria, Czechoslovakia, Hungary, Poland, and Romania. In 1953, the Russian-language Radio Liberation (renamed Radio Liberty in 1964) was launched to broadcast directly into the Soviet Union. Additionally, the USIA published numerous periodicals on a variety of subjects, including *Dialogue*, *Economic Impact*, *Problems With Communism*, *English Teaching Forum*, and *America Illustrated*, and produced a variety of feature films and documentaries designed to present America in a positive light. These, and other media that extolled the positive aspects of American democracy and capitalism and drew attention to repressive elements of the communist system, were distributed through the more than 200 posts that the USIA operated in 91 countries. In addition to creating its own media, the USIA also worked to foster ties with the motion picture industry and educational institutions and worked behind the scenes to influence the tone of news coverage by independent media outlets.

Propaganda During the Post-Cold War Era and the War on Terrorism

When the Cold War ended, the USIA embarked on a new mission of expanding free market democracies. In addition to funding the National Endowment for Democracy and the Center for International Private Enterprise, the USIA shifted its focus toward the promotion of the economically focused Clinton Doctrine, the expansion of the North Atlantic Treaty Organization, the promotion of human rights, anti-crime and antiterrorism issues, and the protection of intellectual property rights. Such objectives lacked the clear focus of the Cold War-era mission, and the USIA lost political support. Deemed obsolete, the USIA was disbanded in October 1999, and its propaganda functions were transferred to the State Department's Bureau of International Information Programs.

Years of budget cuts and diminished attention to public diplomacy became apparent in the immediate

aftermath of the terrorist attacks of September 11, 2001. Faced with an immediate challenge, the United States struggled to quickly develop a new approach to project “soft power.” The first effort involved establishing a temporary Coalition Information Center. What started as a tactical, defensive campaign to counter the anti-American rhetoric spread by the Taliban and al Qaeda eventually developed into a more strategic effort to rebrand America and “win the hearts and minds” of the Arab and Muslim publics.

Achieving this goal was the responsibility of a number of governmental entities controlled by the White House, Department of State, U.S. Agency for International Development, Broadcasting Board of Governors (BBG), and Department of Defense. Eventually, a three-pronged approach to American public diplomacy developed: (1) rapid response to developing news, (2) long-range opinion shaping, and (3) cultural exchanges.

First, regarding efforts to respond to developing news, the U.S. Advisory Commission on Public Diplomacy stated in 2005, “False information spreads quickly and needs to be countered quickly. . . . Good judgment and an understanding of the effects of misinformation on different audiences and cultures are required to counteract misinformation in a timely and effective manner.”

Operations included media outreach initiatives, e-mail news updates, mobile phone alerts, and podcasts distributed to opinion leaders, including journalists and academics. Additionally, news organizations were encouraged to embed journalists within military units, thus providing media access to military operations while also fostering close ties between journalists and military officials.

A second strategy of public diplomacy involved the long-range influencing of international public opinion. One method of accomplishing this was through the use of U.S. government-funded news and media organizations. According to a Government Accountability Office report published in 2007, the stated purpose of such media outlets, operated by the BBG, was “to promote and sustain freedom and democracy by broadcasting accurate and objective news and information about the United States and the world.” The largest efforts in this regard involved the launch of three broadcasting networks designed to target Arabs and Muslims: Radio Sawa, Radio Farda, and Al Hurra TV. Additionally, Voice

of America continues as a major broadcaster around the world, Radio/TV Marti broadcasts to Cuba, and Radio Free Asia broadcasts to China, Tibet, Burma, Vietnam, Laos, Cambodia, and North Korea.

Additionally, the American Corners program—a replacement for the American Centers program launched in Russia in 1993—was dramatically expanded by the undersecretary of state for public diplomacy in 2002. Expanding to more than 400 locations within the next decade, the American Corners program delivered information about the United States through computer displays and a variety of electronic and print media at locations including libraries and universities around the world. Furthermore, the U.S. Agency for International Development has worked to increase its involvement in stimulating economic growth, addressing health and environmental issues, and expanding access to education across the world.

The third strategy of public diplomacy involved cultural exchanges. A key element of Cold War—era public diplomacy, cultural and educational exchanges were revived as a way to encourage cross-cultural awareness of the positive aspects of the United States. Some programs involved sending Americans to foreign countries. For instance, the Speaker and Specialist Program, which sends American experts to foreign countries to build ties with international opinion leaders, was expanded. Other programs involved bringing non-American individuals to the United States for visits and training. For instance, the Edward R. Murrow Journalism Program was launched to bring foreign journalists to the United States for training at prestigious journalism schools. Recommendations have also been made to increase support for English-language and American studies programs in foreign educational institutions.

Twenty-first-century messaging campaigns are exceedingly difficult to implement. Efforts to rapidly respond to developing news stories have proven effective in some instances, but in a digital age in which news can be spread instantaneously via the Internet, it has become impossible to fully “control the news cycle.”

Additionally, long-range, opinion-shaping campaigns through the BBG’s broadcasting services have had mixed results. While providing accurate and detailed news and information through such broadcast services can bolster America’s credibility, an unsophisticated understanding of Middle Eastern

languages and culture has undermined the influence of such programs in some regions.

PSYCHIATRY, MILITARY

Since at least the American Civil War, the U.S. military has attempted to properly identify and treat psychiatric casualties of war. Using ideas pioneered by Napoleon’s chief medical officer Baron Larrey, Union general William Hammod attempted to address the problem of psychiatric casualties often diagnosed under the category of *nostalgia*, a broad term covering a wide spectrum of signs ranging from

homesickness to uncontrollable tremors. These early attempts to identify and treat psychiatric casualties were primitive and haphazard at best, though they did usher in the fundamental issues of U.S. military psychiatry. First, are psychiatric casualties legitimate? Second, if so, what is the proper medical definition of a psychiatric casualty? And based on the definition, what is the best way to either prevent or treat such victims? This entry examines the history of military psychiatry in the U.S. armed forces from World War I to today.

World War I

The early 20th century saw the confluence of two seemingly unrelated events: (1) the attempt of psychiatry to become a legitimate medical discipline and (2) the rise of modern industrialized warfare. World War I was the first true test of U.S. military psychiatry. Early in the war, British physicians had coined the term *shell shock*, an attempt to explain the severe psychiatric reactions of British soldiers to heavy-artillery shelling. This diagnosis assumed a physiological cause, the blast waves of exploding shells slamming the brain against the sides of the skull, resulting in brain injuries. Shell shock alone soon proved to be an inadequate explanation for the numbers of soldiers reporting or demonstrating psychiatric conditions. For example, not all soldiers who experienced a heavy-artillery barrage developed or complained of psychiatric illness, while at the same time a growing number of soldiers were admitted as psychiatric casualties who were not subjected to heavy-artillery bombardment.

By the time the United States entered the war in 1917, the question of definition had remained confused, and a new, more inclusive term for psychiatric casualties was being used, *war neurosis*. Despite the confusion over labeling, treatment became more organized, guided by specific principles developed by the British and adopted by the American military's senior psychiatrist, Thomas William Salmon. Salmon arranged for treatment for American psychiatric casualties to be conducted as close to the front as possible. Treatment consisted of rest, proper nutrition, and return to a regular military routine as quickly as possible. American involvement in the Great War did not last long, however, and the implementation of Salmon's system remained haphazard at best.

Following World War I, the U.S. military fell into decline, and many of the lessons learned by U.S. military psychiatry were forgotten. Much of the work that was done during the interwar years was concerned with the theories conceived by the Swiss psychiatrist Adolf Meyer, who argued that certain social and environmental factors can predispose a person to mental illness. U.S. military psychiatry thus concluded that proper preinduction screening techniques could eliminate potential psychiatric casualties. As a result, more emphasis was placed on preventing susceptible recruits from entering the military rather than on the care and treatment of psychiatric casualties. The Second World War would dramatically challenge these assumptions.

World War II

Despite rejecting almost eight times more inductees in World War II than in World War I, U.S. soldiers were discharged for psychiatric reasons at a rate 2.4% higher than in World War I. Approximately, 1.3 million members of the U.S. military suffered some kind of psychiatric casualty during World War II. What constituted a psychiatric casualty had broadened during the Second World War, but this led to even further confusion regarding an accurate clinical definition. The terms *combat exhaustion* and *combat neurosis* became popular during World War II, continuing to emphasize the physiological rather than the psychological origins of mental casualties. The most important change in U.S. military psychiatry during the war was the conclusion by some psychiatrists, like John Appel and Gilbert Beebe, that psychiatric casualties are inevitable and anyone can become a victim. In fact, according to Appel and Beebe, for most soldiers, exposure to a total of 180 combat days or more will leave them in a vegetative state. Also, the lessons from World War I were rediscovered, especially with regard to the proper care and treatment of psychiatric casualties. The procedures developed by Dr. Salmon in World War I were restored and by June 1944 were generally well established.

The Second World War produced mixed results for U.S. military psychiatry. The sheer number of psychiatric casualties brought about grudging acceptance of the need for military psychiatry within the armed forces. However, psychiatry's inability to develop a clear definition and terminology for

psychiatric casualties left some within the military questioning the scientific validity of the military psychiatric field. This ambiguity had practical economic ramifications for the military and for American society. Without a clear diagnosis, postwar questions were raised on whether the U.S. military was responsible for psychiatric health care costs after the war. Up to this time, military psychiatry had concentrated on dealing with the immediate mental effects of combat. Researchers like Samuel Futterman, however, began to note by 1951 that the number of veterans reporting to Veterans Administration hospitals with complaints of war neurosis was increasing and many of them were complaining of symptoms for the first time. It appeared that war may have longer lasting psychological impacts on veterans than expected and the potential cost for care could be enormous. Finally, one of the new preventive strategies proposed after the war was a better, more reliable rotation system to minimize the total combat time experienced by a soldier.

Cold War

The Korean War suggested that U.S. military psychiatry had finally proved its worth, as psychiatric casualties were much lower than in World War II. The system for care and treatment was well established and set up quickly despite the surprising nature of the North Korean attack. Colonel Albert Glass was the driving force behind American military psychiatry during the war. Combining a 9-month rotation with a 2-week rest during the tour seemed to mark the point at which U.S. military psychiatry could successfully manage the immediate effects of combat neurosis. Still, the question of the long-term effects of combat on the veterans remained unasked.

Between Korea and Vietnam, the work of military psychiatrists had been reduced primarily to psychiatric evaluations of soldiers prior to court-martial hearings or administrative discharge. Contemporary psychiatric theories regarding the role of childhood or the unconscious in explaining mental illness were not well received among military psychiatrists.

Successful psychiatric treatment of combat trauma continued during the Vietnam War, even improving on its success during the Korean War. In fact, the success of U.S. military psychiatry in treating immediate combat trauma may help explain why its responsibilities increased to treating alcohol

and substance abuse cases. But the most profound change within U.S. military psychiatry was the gradual shift in emphasis toward dealing with the question of the long-term psychiatric effects of war. This produced a new controversy, the broad yet ambiguous diagnosis of posttraumatic stress disorder (PTSD). Slowly, soldiers who were previously dealt with as having disciplinary problems, such as alcohol abuse, were now given medical discharges and could be compensated with a military disability payment. It was feared that this policy could lead to an erosion of the traditional military value of discipline and negatively affect troop morale and cohesion. The chaotic conclusion to the Vietnam War led many military professionals to ask fundamental questions regarding the state and future of the U.S. military, including military psychiatry.

In part to address the decline in military discipline during the latter years of Vietnam, in 1973 the U.S. military became an all-volunteer force. The idea was to create a military with more discipline and cohesion, which in turn would create more mentally sound armed forces. Meanwhile, U.S. military psychiatrists were busy treating a large number of PTSD patients from Vietnam using new tools such as group therapy and pharmaceutical drugs. In the 1980s, the National Vietnam Veterans Readjustment Study found that approximately 15% of male and 9% of female Vietnam veterans had PTSD at the time of the study. Despite these measures, many new career soldiers in the all-volunteer military feared that admission to having psychiatric trauma might jeopardize their careers.

A major factor in legitimatizing PTSD was its formal inclusion in the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders*, third edition (DSM-III) in 1980. This provided an official definition of PTSD and also provided postwar medical benefits and is significant as a recent U.S. Department of Veterans Affairs study concluded that 830,000 Vietnam veterans now report PTSD symptoms.

Post-Cold War and the Global War on Terrorism

The next large-scale U.S. military endeavor was the Persian Gulf War in 1991. With only 148 combat deaths, combat trauma was minimal compared with other conflicts, and victory was clear. But this war was also not without controversy. Gulf war

syndrome, a varied set of signs and symptoms, including fatigue, headaches, and some neurological problems, baffled physicians as to its origin. Eventually, evidence suggested that soldiers were exposed to fallout from the destruction of Iraqi chemical weapons facilities. Military psychiatrists were wary of attributing the soldiers' complaints to PTSD but rather urged commanders to accept these complaints as legitimate physiological injuries.

Also during the war, the greater acceptance of military psychiatry was demonstrated by the existence of mental health specialists, trained by military psychiatrists, in combat units, who conducted after-action analysis to determine stress reactions among soldiers. These teams also helped recognize high-stress situations and then helped track those soldiers who experienced high stress to minimize the likelihood of PTSD. Even with greater awareness of PTSD and the short duration of the fighting, research suggested that PTSD rates ranged between 9% and 24% for Persian Gulf veterans.

By the end of the 20th century, U.S. military psychiatry had come a long way. Its procedures and organization to recognize and treat the psychiatric effects of combat trauma had advanced significantly. PTSD, however, remained controversial, and its ever-broadening definition still remained vague. In addition, the ability to determine disability rates for PTSD seemed arbitrary to some, and statistics regarding PTSD were suspect. With such a broad definition, critics suggested, almost anyone alive could be diagnosed with PTSD. Statistics in the military could be quite skewed as a number of veterans still remained wary of reporting psychiatric problems for fear of negatively affecting their career.

The attacks of September 11, 2001, launched the U.S. military into a new war on terrorism. In October 2001, the United States began Operation Enduring Freedom against Afghanistan with the intention of capturing Osama bin Laden, disrupting terrorist-training facilities, and eventually toppling the Taliban government. Two years later, in March 2003, the United States invaded Iraq in Operation Iraqi Freedom, a more controversial war ostensibly waged to eliminate the threat of weapons of mass destruction believed to be held by Saddam Hussein. Initially, for both conflicts, it was believed that the local support and the use of overwhelming air and artillery power would produce a quick victory, thus producing little or no mental stress on the

troops involved. However, neither war played out as expected, and new issues for military psychiatry have appeared.

Sources of combat stress in Afghanistan and Iraq have some similarities to those in past wars, like alien environments and fear of being wounded or killed. But there are some new factors that have plagued U.S. military psychiatry. One of the most prominent is a direct result of an all-volunteer military. With troop levels at approximately 2,800,000 and roughly divided between the regular military and reserves, the U.S. armed forces have found themselves stretched thin to provide troops to two different theaters. This has led to the largest use of reserve forces since World War II and a number of troops serving in multiple rotations. Less trained troops are being placed in high-stress combat situations, and multiple tours have been very stressful on families. Even among single active-duty personnel, many veterans report that being at home is not relaxing, as they count the days to their return.

Advances in medicine have proved to be a double-edged sword. Wounds that previously would have been fatal are now being treated successfully, but at a cost. Traumatic brain injury is a new phenomenon coming out of the wars in Afghanistan and Iraq and has a striking resemblance to shell shock. A 2008 RAND study quoted by Secretary of Defense Robert Gates suggested that approximately 600,000 Afghanistan/Iraq War veterans could suffer some level of traumatic brain injury during their service. Military psychiatrists are seeing the psychiatric consequences of significant injuries to the brain along with multiple traumatic injuries, such as amputations and severe scarring. Many of these injuries are occurring in a low-intensity environment, sustained in brief surprise firefights or through improvised explosive devices. This lack of proper front lines and combat zones can increase anxiety and the sense that nowhere is it safe.

The accurate counting of PTSD victims remains problematic. A number of studies indicate that veterans of the wars in Afghanistan and Iraq complain of psychiatric issues but are afraid to seek out treatment or support for fear that it will harm their career in the military. One RAND study in 2008 reported that 20% of returning American veterans were diagnosed with PTSD or severe depression while only 10% received treatment. Another factor that can confuse accurate reporting of PTSD is the

high number of suicides among current veterans. In a 2008 interview, Thomas Insel, director of the National Institute of Mental Health, predicted that due to poor funding for mental health programs for veterans, it is possible that suicides among returning veterans would soon surpass combat deaths. In such cases, should suicide victims be counted as psychiatric casualties of war?

The fear of speaking out about psychiatric military trauma is further exacerbated by the fairly new presence of women on the battlefield. Female veterans are wary of reporting PTSD, especially if it has to do with being raped while in the military. The role of women in the military is a new issue for military psychiatry, and much of the work on this topic is still too early to draw definitive conclusions, but interesting questions are beginning to emerge. So far, female veterans are reporting slightly higher rates of PTSD than their male counterparts, but it is more significant that their symptoms are more pronounced than those of the men. A possible reason for this is that women hesitate to report incidents for fear of some kind of retribution; thus, by the time they receive medical treatment, their symptoms are acute. Another explanation comes from a 2005 Department of Veterans Affairs study that concluded that a much greater proportion of women than men enter the military having already experienced a severe psychiatric trauma, such as rape or abuse. People entering the military who have already suffered such trauma are more likely to leave the combat theater with PTSD.

An equally important predictor for PTSD, based on the 1999 Rachel MacNair study, is the experience of killing. Those veterans who have killed or believed that they have killed have significantly higher rates of PTSD. This combination of having already experienced a significant psychiatric trauma prior to military service and then killing someone or witnessing the death of a fellow soldier can dramatically increase the risk for PTSD. So far, this seems to hold true for both men and women.

The war on terrorism continues to show the relevance of military psychiatry for the U.S. armed forces. As of 2010, the number of returning veterans of the wars in Afghanistan and Iraq suffering from PTSD is approximately 20%. VA resources are stretched trying to provide mental health care, and local ability to manage these soldiers is even less. Economically, the greater survivability of war

veterans means that more veterans are living longer with PTSD, and with this comes the subsequent financial cost to the nation. Multiple tours and the presence of women in combat zones are just two of the new issues faced by military psychiatry. And for many in the military psychiatric field, the most enduring problem to overcome is the stigma attached to psychiatric casualties.

PSYCHOLOGICAL WARFARE (PSYOP)

The terms psychological warfare (PSYWAR) and psychological operations (PSYOP) are often used interchangeably. Both are of recent origin. They signify an activity, though, that is hardly new. The effort to influence the perception of others by employing nonlethal means of persuasive communication is as old as human conflict. Americans adopted the term *PSYWAR* during World War II to distinguish their operations from those of their enemies that they characterized as deceitful propaganda. The Cold War, an ideological contest waged

principally by the Soviet Union and the United States following the Second World War's conclusion, convinced Americans of the need for another change. They sought a more inclusive term to characterize the expanding array of psychological activities that America undertook to check communist expansion.

Consequently, the United States created the Psychological Operations Coordinating Committee in 1951. This interagency group worked to incorporate psychological considerations systematically into the formulation of national policy. PSYOP came of age under the tutelage of American officials who sought to gain an advantage in the global contest with communists for hearts and minds. They utilized PSYOP, with varying degrees of success, both to inform and to execute national policy throughout the Cold War. American officials defined PSYOP broadly, encompassing the nation's whole means of communicating its aims persuasively.

Such a general articulation of PSYOP by policymakers generated confusion about the distinction between PSYOP and information operations (IO). "Information" is a label that American officials first utilized during the First World War to characterize their effort to disseminate the war aims of the United States, both at home and overseas. The use of this term continued during the Second World War and persisted throughout the Cold War. This invited critics of persuasive communication to label American PSYOP as propaganda, associating the term with the same nefarious means that the United States accused its adversaries of practicing.

Efforts made by policymakers to articulate the difference between PSYOP and IO neither silenced skeptics nor brought clarity for military commanders who tended to conflate the two activities. Confusion persisted even as a consensus emerged about the need to secure the cognitive terrain in the Global War on Terrorism that ensued from al Qaeda's attack on the United States on September 11, 2001. From 2005 to 2009, Pentagon spending on PSYOP/IO activities rose from \$9 million to \$580 million a year, before dropping to \$202 million in 2011, the year when America's conflict in Iraq concluded. Finally, in June 2010, Secretary of Defense Robert M. Gates, with the support of Special Operations commander Admiral Eric Olson, called for replacing the term *PSYOP* with military information support operations (MISO).

Consequently, the 4th PSYOP Group, located at Fort Bragg, North Carolina, became the 4th Military

Information Support Group, and a new unit, the 8th Military Information Support Group became active in August 2011. The 8th Group, composed of 1,070 soldiers, assumed responsibility for the 1st, 5th, and 9th MIS battalions, while the 4th Group retained the 6th, 7th, and 8th battalions, with a total of about 800 soldiers. This development reflected a similar one in England, where, between 2000 and 2005, the 15th (UK) PSYOP Group became known as the 15th (UK) Information Support Group. The change back acknowledged a renewed emphasis on tactical PSYOP support for combat operations in Iraq and Afghanistan. Moreover, it constituted an effort to clarify a mission that is historically misunderstood.

This entry considers recent applications of PSYOP, after first discussing the historical precedents that inform the efforts of contemporary government organizations.

Winning Hearts and Minds

The limitations of waging a military war of attrition against a guerrilla force became apparent to American officials in the wake of the Tet Offensive in Vietnam (1968). The general uprising staged by the communists throughout Vietnam, including in many areas previously deemed by U.S. forces as secure, failed to bring about a communist victory. It compelled American officials, however, to reconsider their wartime strategy. Through the office of Civilian Operations and Revolutionary Development Support, U.S. Military Assistance Command Vietnam instituted a program of pacification that emphasized winning hearts and minds over accumulating body counts. It sought not only to induce enemy defections but also to build Vietnamese allegiance for America's noncommunist ally centered in Saigon, the Republic of Vietnam.

Civilian Operations and Revolutionary Development Support advised officials to consider closely the psychological dimension in all aspects of the ongoing war to garner widespread Vietnamese support. This effort extended beyond Vietnam. The Joint United States Public Affairs Office, an organization housed in the U.S. Information Agency (USIA), worked to gain favorable coverage by international media for American initiatives in Vietnam. The ultimate impact on the war made by America's program to win hearts and minds remains debatable. Still, at the time of its operation, Americans

identified the initiative as revolutionary. It broadly conceptualized PSYOP as the whole process of U.S. communications. This included PSYWAR aimed at combatants, nation-building activities geared to win the allegiance of civilians, and public relations directed at outside audiences.

Since the Beginning

The turn toward PSYOP constituted a new direction for Americans in Vietnam, but strategists had long before discerned the importance of winning hearts and minds during wartime. From Sun Tzu's treatise *The Art of War*, which dates back to the 6th century BCE, to the 19th-century observations of Carl von Clausewitz in *On War*, military thinkers considered perception management as essential to achieving victory. They stressed that assaulting the enemy's mental equilibrium should be afforded the same priority as its physical annihilation. Throughout history, ample evidence exists to suggest that military leaders

orchestrated their campaigns mindful of psychology. Some, such as Alexander the Great (356–323 BCE), sought to win hearts and minds. Others, like Genghis Khan (1162–1227), strove to terrorize them. In both cases, though, psychological appeals hastened victory by avoiding violent confrontation.

While Americans set out to revolutionize the practice of PSYOP in Vietnam, many historical precedents existed, including that of their national forebears. During America's War of Independence in the 18th century, the colonial military paled in comparison with the might projected by the British. Out of necessity, from the onset of hostilities, the Americans proved adept at shaping perception to achieve an advantage. They repeatedly succeeded in portraying the British as brutal oppressors who repeatedly orchestrated massacres at places such as Boston (1770) and Paoli (1777). Meanwhile, pamphleteers worked assiduously to maintain support at home for the rebellion, disseminating appeals such as *Common Sense* (1776) by Thomas Paine.

World War I

Over the next century and a half, the mechanization of war and mass communication blurred the line between civilians and soldiers. The psychological dimension of war demanded from its participants an unprecedented level of attention. The First World War (1914–1918) made this apparent. The conflict exacted tens of millions of casualties from around the globe. Miles of trenches dug by armies in Europe and fortified with barbed wire proved nearly impregnable. Offensive operations initiated in 1916 by the Central Powers (Germany, Austria-Hungary, and the Ottoman Empire) at Verdun and by the Allies (England, France, and Russia) at the Somme exhausted hundreds of thousands of lives for little gain. The war became a contest of wills. Newly created agencies, such as the Press and Information Bureau in France and the Ministry of Information in England, worked to boost morale at home and undermine it elsewhere.

The United States added exponentially to this effort when it joined the war on the side of the Allies in 1917. Unprepared for such a military commitment and forced to transform their nation's mind-set of neutrality, American officials diligently worked to create an apparatus devoted to transforming the psychological landscape to their favor. A small group of U.S. Army officers in the Military Intelligence Section, War Department General Staff displayed an interest in psychological exploitation. Concomitantly, President Woodrow Wilson created the Committee on Public Information (CPI) to propagate American war aims at home and abroad. The CPI, though directed by the newspaperman and Wilson supporter George Creel and staffed with writers and journalists, refused to become directly involved with combat propaganda.

Frustrated with the CPI, New York labor reporter Heber Blankenhorn took his idea of targeting the morale of enemy soldiers to Major Charles H. Mason, chief of the M.I.2, Foreign Intelligence Branch, Military Intelligence Service. Blankenhorn convinced Mason and Colonel Ralph Van Deman, Military Information Support chief, to create a propaganda department under his command as a directly commissioned U.S. Army captain. Initially designated as Psychological Subsection within the M.I.2 section of the expanded and renamed Military Intelligence Branch, the army reassigned

Blankenhorn's outfit as the Propaganda Section D of the Press and Censorship Branch (G-2-D) under Major Alexander L. James Jr., G-2, American Expeditionary Forces/General Headquarters in the fall of 1918.

Blankenhorn's Section D operated under tight orders that limited its mission to demoralizing the enemy through direct tactical appeals. Between August and November 1918, G-2-D crafted 21 tactical leaflets and produced more than 5 million of them. They targeted German machine gunners, aiming to weaken their will in the critical last 30 minutes of an Allied charge. G-2-D relied on prisoners of war to gain insight into the enemy's mind-set and utilized themes designed to appeal to a soldier's weariness with war. The American effort made quite an impression on its enemies. After the war, German Field Marshals Erich von Ludendorff and Paul von Hindenburg acknowledged the efficacy of Blankenhorn's outfit. So too did a young corporal named Adolf Hitler. Hitler drew on these lessons after the war with other like-minded individuals, such as Joseph Goebbels. Together, they crafted psychological appeals that helped enable their Nazi party to seize control of Germany and incite another world war.

World War II

The threat posed by Nazi Germany resuscitated America's interest in what officials now deemed psychological warfare. By the eve of World War II, the institutional memory of both G-2-D and CPI had largely disappeared from army commands, staff schools, manuals, and doctrine. In 1940, President Franklin D. Roosevelt dispatched William J. "Wild Bill" Donovan to survey the situation in Europe. A World War I veteran, Donovan returned to the United States impressed by Nazi Germany's techniques for disseminating psychological appeals and by the British efforts to offset them. Donovan urged Roosevelt to make a similar effort central to any future American involvement in the hostilities. Roosevelt responded by appointing Donovan to direct the newly created Office of the Coordinator of Information (COI).

Donovan constructed the COI to engage in a broad range of PSYWAR that included white propaganda (materials such as leaflets, attributable to the United States), black propaganda (rumor campaigns

and other clandestine activities), sabotage, and the synthesis of strategic information. From the onset, Donovan worked to establish a close relationship between the COI and America's military by imbuing the organization with a fiercely aggressive mentality. He successfully lobbied Roosevelt to demolish the COI and reconstitute it into two separate parts: the Office of Wartime Information and the Office of Strategic Services (OSS). This action occurred as it became evident that the notion of PSYWAR advanced by Donovan contrasted sharply with the informative, CPI-like approach called for by the writers and journalists who staffed the COI's Foreign Information Service. Roosevelt acted in July 1942, putting Donovan's OSS under the jurisdiction of the newly formed Joint Chiefs of Staff (JCS).

The JCS hardly greeted Donovan's unconventional organization into the fold with open arms. Its members hesitated to issue the OSS an official charter. They finally provided it with one in December 23, 1942 (JCS 155/4/D). The agency fared little better in the field, where U.S. Army General Dwight David Eisenhower, commander of Allied Force Headquarters in the Mediterranean, sought to exert control over PSYOP by creating the Allied Force Headquarters in early 1943. Brigadier General Robert A. McClure, Psychological Warfare Branch commander, reportedly viewed PSYWAR with a great deal of skepticism and restricted OSS activities to the tactical battlefield.

Through the course of the war, the OSS overcame much of the reservation that greeted it. Donovan's agency received increasingly free rein to engage in black operations, conducting clandestine radio, leaflet, rumor, poison-pen letter, and black mail campaigns to bring about subversion of morale behind enemy lines. Eisenhower constituted the most important convert.

Post-World War II

After his election to the presidency in 1950, Eisenhower worked to build on the Psychological Operation Coordinating Committee, established by his predecessor Harry S. Truman. In 1953, with the aid of C. D. Jackson, former head of the Psychological Warfare Division in Europe, and OSS veterans such as Abbott Washburn, Eisenhower made PSYOP central to America's Cold War strategy. He created the USIA as an independent foreign

affairs agency within the executive branch. The agency's first director, Theodore C. Streibert, had helped found the Mutual Broadcasting System before serving as a public affairs consultant to James B. Conant, High Commissioner in West Germany. This agency's subsequent directors shared Streibert's background in media and included the World War II correspondent Edward R. Murrow, appointed USIA director in 1961 by President John F. Kennedy.

Following America's involvement in Vietnam and congressional scrutiny of the role USIA played in directing PSYOP, the agency focused on furthering America's Cold War aims through public diplomacy. PSYOP in war, stability, and humanitarian operations increasingly came under the purview of the Pentagon, specifically the U.S. Army Special Operations Command. Joint Publication 3-53 broadly outlines the mission of PSYOP to include serving supporting commanders through advice about the targeted population and influencing foreign populations by conveying the Joint Force Commander's intent. It further charges PSYOP with countering adversary propaganda while correctly portraying America's intent and actions. Finally, PSYOP is tasked with relaying public information in support of humanitarian activities.

Since the 1980s, PSYOP served to support numerous stability operations, including Urgent Fury (Grenada, 1983), Just Cause (Panama, 1989), Provide Comfort (Iraq/Turkey, 1991–1994), Restore Hope (Somalia, 1992–1993), Uphold/Restore Democracy (Haiti, 1993–1994), Joint Guard (Bosnia-Herzegovina, 1995–1998), Assured Response (Liberia, 1996), and Noble Anvil and Allied Force (Kosovo, 1999). Activities included radio broadcasts and leaflet drops, with face-to-face communication identified as achieving the greatest success. The lessons learned in each case suggested the importance of every soldier knowing PSYOP themes and messages. Achieving this task in Haiti indicated that the impact of simple greetings and gestures by American forces contributed greatly to transforming the views that Haitians held regarding American troops and their motives.

A common problem for PSYOP conducted in stability operations concerns the insufficient number of well-trained specialists who possess language and regional expertise capability. This issue became particularly evident in Somalia, where early versions of printed leaflets contained misspelled words, words

that did not exist in the Somali language, and, in one instance, an inadvertent substitution of the word *slave* for *world* in referencing the relief force. PSYOP officials contend that such miscues are directly attributable to their perennial lack of resources—a consequence, they contend, of the widely varying appreciation of the importance of PSYOP activities that exists among individual commanders.

Global War on Terrorism

PSYOP involvement in Operation Enduring Freedom resulted immediately after the terrorist attacks of September 11, 2001. The following day, Tactical PSYOP Detachment 940 began target audience analysis of Afghanistan, including the Afghan population, al Qaeda, and the Taliban. A Joint Psychological Operations Task Force (JPOTF) became active on October 4, 2001, at Fort Bragg, North Carolina. It came under operational control of U.S. Central Command, which it supported in carrying out short-term strike operations, long-term counterterrorism operations, and engagement activities. Within a month of its creation, JPOTF totaled 95 personnel, with 74 located at JPOTF Main at Fort Bragg. EC-130 Commando Solo aircraft transmitted radio broadcasts to Afghanistan, beginning on October 5, 2001, 2 days prior to the start of major combat operations. JPOTF delivered more than 7,500 small, battery-powered transistor radios by airdrop and by tactical PSYOP teams operating with Special Forces detachments.

Initially, PSYOP labeled al Qaeda as foreign interlopers and sought to drive a wedge between it and the Taliban. Following national policy, PSYOP strategy changed to appeal to the Afghan people to support neither the Taliban nor al Qaeda, branding both as terrorist entities that wrought misery in Afghanistan. PSYOP sought to explain to Afghans the purpose of the presence of coalition forces and pledged not to provoke a conflict with Islam or to occupy Afghanistan. It emphasized the coalition's interest in departing from Afghanistan once rendering it safe from terrorism.

By the end of 2001, the North Atlantic Treaty Organization received authorization from the United Nations Security Council through Resolution 1386 to create the International Security Assistance Force (ISAF) to secure Afghanistan. Consequently, a number of nations have contributed PSYOP support to

the Combined Joint Psychological Operations Task Force at ISAF. These include Belgium, Italy, Canada, Great Britain, and Germany. They have engaged in a variety of efforts. These include the British 15th (UK) PSYOP Group producing the newspaper *ISAF News* and its orchestrating the “Game of Unity,” a soccer match that represented the first major athletic event to transpire in Afghanistan since the Taliban's collapse. Meanwhile, German PSYOP promoted a “peace kite” so that Afghans might once again enjoy a popular activity banned under Taliban rule.

In the buildup to Operation Iraqi Freedom (OIF), which commenced combat operations in Iraq on March 21, 2003, American forces drew on

the extensive experience gained from Operations Southern Watch, Northern Watch, and Desert Fox. In late 2002, U.S. Central Command ordered the JPOTF commander at the Psychological Operations Support Element located in Tampa, Florida, to begin prehostility PSYOP against Iraq. The total number of PSYOP personnel committed to the JPOTF in support of OIF fluctuated between 600 and 700, with a handful forward-deployed with the JPOTF commander who relocated to Qatar in February 2003. Through radio broadcasts and leaflet dissemination, PSYOP messages sought to undermine the confidence of the Iraqi military and security forces, degrade the dictator Saddam Hussein's confidence in retaining control of Iraq, and deter the use of weapons of mass destruction.

With the onset of combat, in contrast to the focus on civilians demonstrated in Operation Enduring Freedom, leaflets dropped during OIF targeted military forces. Reflecting the coalition's concern with conventional units rather than irregular forces, PSYOP called for the Iraqis to surrender, desert, or capitulate. Commando Solo and SOMS-B broadcasts emphasized Saddam Hussein's illegitimacy and incompetence for the Iraqi public at large. Tactical PSYOP teams (TPTs) attached to ground forces provided PSYOP support directly to maneuver units and special operations detachments. PSYOP teams were deployed in the southern region with the army's 3rd Infantry Division, the 1st Marine Division, and the 10th Special Forces Group. In western Iraq, TPTs supported the 5th Special Forces Group in securing the town of Ar Rutbah and PSYOP units in the north attached to the Joint Special Operations Task Force-North. The TPTs served to protect civilians and as combat multipliers. TPT 1141, for example, supported Task Force Tarawa by ensuring a safe passage for civilians, obtaining vital intelligence, and coaxing an Iraqi paramilitary force hiding in a hospital to surrender to the 1st Marine Expeditionary Force.

The ability of PSYOP to support major combat operations is evident from OIF. PSYOP received credit for causing Iraqi soldiers to desert, deterring the use of weapons of mass destruction, and preventing oil fields from being destroyed. OIF products made direct and simple appeals that, combined with the immense coercive force employed, produced immediate, observable, and favorable behavioral responses. In ensuing stability operations, the record of success is mixed. Toppling a regime is inherently

less complicated than building a new nation. In Iraq, following the conclusion of combat operations in the summer of 2003, the Combined Joint Task Force Seven and the JPOTF received an expanded mission that included facilitating civil order and defeating the resistance mounted by insurgents against the new Iraqi government.

Given the resources devoted to PSYOP, accomplishing such assigned objectives is problematic. Once combat operations conclude, the credibility of PSYOP is newly challenged by emergent voices that compete for public influence. Moreover, while the threat of conventional force remains, it is wielded more subtly, rendering the need for PSYOP products that are increasingly sophisticated, timely, and tailored to local audiences. The effectiveness of PSYOP further becomes tied irrevocably to the way in which the general population perceives the behavior of the remaining security forces. In Iraq, for example, commanders reported that popular sentiment derived directly from the personal relationships between coalition soldiers and Iraqi citizens.

To ensure that PSYOP transcends its successes on the battlefield to win hearts and minds and to secure the peace, the effort required is holistic and proactive. The process requires time, and it is dependent on commanders on the ground who work to incorporate and support the critical and ongoing target audience analysis that amply supported PSYOP provides.

PUBLIC AFFAIRS, MILITARY

The relationship between the U.S. military and the press has a long history; however, only in the 20th century did the branches of service codify the role of public affairs officers. Prior to the 20th century, public affairs were the concern of the commander. A commander decided when and how to interact with the press. There was no staff officer permanently assigned to this role. This entry discusses the history and the role of public affairs officers in the U.S. military.

From Journalists to War Correspondents

For much of the 18th and 19th centuries, journalists traveled with military units or by themselves to the battlefield so they could provide reports back to their paper. Initially, commanders had little control over what journalists reported to their news organization. This changed during the Civil War, when General Joseph Hooker demanded that the journalists covering his units use a byline to identify themselves. Previously, reporters did not have to identify themselves in their stories; this made it difficult for a commander to know which reporter was responsible for reporting certain events. Making reporters identify themselves in their stories ensured that individual reporters took responsibility for the information they provided to the public. During this time, there were no official public affairs officers who worked with journalists to ensure that their stories were truthful and did not compromise the mission. The relationship between the media and the mili-

tary at this time was an ad hoc system of temporary agreements, with no official policy concerning the interactions between the two parties.

The prominence of Civil War journalists led to the rise of professional war correspondents. These journalists followed units throughout the campaigns and provided consistent coverage of their movements and actions. The rise of war correspondents led to the need for military officials to create more stringent controls over them. It also sparked the realization that the military needed to work with journalists more formally in order to ensure that they did not compromise mission secrecy or provide vital information to the enemy.

World War I provided the first instance of an official relationship between the media and the military. General John J. Pershing ordered that all journalists covering the conflict obtain accreditation from the American Expeditionary Force. This process required a journalist to pay a \$1,000 bond in addition to agreeing that the American Expeditionary Force intelligence section had the authority to screen and censor his or her report. Initially, the American Expeditionary Force press corps had 31 journalists; however, by the end of the war, that number increased to 411. All of the censorship operations fell under Major Fredrick Palmer, who was previously a military correspondent.

Military Public Affairs Becomes Official

During World War II, President Franklin Roosevelt did not institute the draconian policies of President Woodrow Wilson. However, he did establish official offices that controlled the flow of information and how the press accessed soldiers and the battlefield, such as the Office of War Information. World War II also saw the birth of the first official public affairs officers in the military. In 1940, Chief of Staff of the Army General George Marshall and Secretary of War Henry Stimson created the Bureau of Public Relations. This office held weekly press conferences. After the conflict, the War Department had a chief of information, Lieutenant General Joe Collins, appointed by the chief of staff of the army, General Dwight Eisenhower, in 1945.

With the formation of an official public affairs corps in the military, it was important to define the role of public affairs officers. The main contention was whether their purpose was to disseminate

information to journalists or whether they needed to cooperate with officials in the psychological warfare arena to ensure that their messages supported each other. The 1948 Information and Educational Exchange Act, also known as the Smith-Mundt Act, prohibited government officials from distributing American propaganda to a domestic audience. This act prevented the coordination of public affairs with other information operations of the military. It provided a clear distinction between public affairs officers and psychological warfare officers, and this distinction continues today.

The Korean and Vietnam Wars proved a difficult task for public affairs officers. These conflicts did not have the public support that World War II enjoyed. Public affairs officers faced the difficult task of explaining these conflicts and their importance to an increasingly skeptical American public. Daily press briefings during the Vietnam War allowed public affairs officers the chance to communicate directly with the press corps. However, the information in these daily briefings sometimes conflicted with the events in the field. This led to a lack of credibility and a suspicion among the press corps, and many Americans, of military public affairs. The difficulty of communicating military information while not compromising the mission instilled an organizational reluctance in the military to cooperate with the media. The relationship between the military and the media, especially after Vietnam, was adversarial.

Operation Urgent Fury, which took place in 1983, provided the impetus for change in military public affairs. The press did not have any journalists covering the conflict in the field because the military did not alert them to its operations and would not credential any journalists to report from Grenada for 2 days. Members of the press corps lobbied the government to change the military's stance after the conflict and make its public affairs more cooperative. In 1985, Secretary of Defense Caspar Weinberger and the Joint Chiefs of Staff created a press pool for military public affairs. This pool would be deployed with American troops to areas of conflict and would cover the action. Although the pool of reporters had to abide by the rules established by the commander, they were on the battlefield and could report as much as they needed without compromising the mission.

During Operation Desert Storm, journalists covered units by becoming a part of the units they

covered. These embedded journalists traveled with their units and reported back to their organization to provide a unique perspective on the conflict. This conflict also saw the rise of satellite coverage of the war. Journalists could communicate with their affiliate in real time and discuss what was happening where they were. This real-time information brought the war close to home for many Americans.

The post-Cold War public affairs environment required adaptations to a new media environment as well as to new technology. Public affairs officers worked closely with journalists to ensure that they had access to the information they required but did not report specifics that would compromise the mission. Public affairs officers also had to work within a military organization that was suspicious of journalists' bias concerning military operations.

Public Affairs After 9/11

After September 11, 2001, the Global War on Terrorism began. This conflict required military public affairs to once again change to face the ever-evolving media environment. American citizens expected constant coverage of ongoing military operations from news outlets; military public affairs officers provided news outlets with access to and information about the conflict. As news organizations increased the ability of citizens to see events transpire on the battlefield in near time, public affairs officers had to improve their ability to provide context to the images broadcast from the battlefield.

In the opening stages of the Global War on Terrorism, Assistant Secretary of Defense Victoria Clark told reporters that the attacks on September 11 changed the paradigm of public affairs in the military. Clark said that her office intended to disseminate as much information as possible as quickly as possible. To this end, the department activated the press pool for Operation Enduring Freedom.

For Operation Iraqi Freedom, the Department of Defense determined that the press pool was not an adequate solution to the information operation needs of the mission. In addition to the press pool, journalists would embed with units. This would allow journalists to cover the events more efficiently. It would also give commanders some control over how journalists experienced the battlefield. However, this control did not extend to censorship.

In contrast to previous conflicts, journalists did not have to submit their stories to the military chain of command for approval. This was one of the first conflicts where the military allowed journalists such broad access to the battlefield and unrestricted reporting of the events that journalists witnessed. Public affairs officials worked with journalists to coordinate their access to the battlefield. They also worked to disseminate information to journalists who operated from the press pool.

One event in Operation Iraqi Freedom showed the importance of public affairs officers in military operations. In 2004, several photos showed American soldiers abusing detainees at Abu Ghraib prison in Iraq. Public affairs officers quickly worked to explain the limited scope of those involved in the abuse and to ensure that the public did not think that this was part of a larger program of mistreatment of detainees.

During the Global War on Terrorism, media outlets discussed civilian deaths from military operations more frequently than in previous conflicts. This required public affairs officers in the military to be proactive and explain the steps that the U.S. military took to mitigate such occurrences. It also required public affairs officials to quickly explain and defend the necessity of military operations as well as to tell the public frankly that eliminating all civilian deaths in military operations was impossible.

The Evolution of Public Affairs

Public affairs in the U.S. military was transformed in the 20th century from an ad hoc organization created during wartime or contingency operations to coordinate with journalists into a permanent part of the military staff structure. The ability of military commands to coordinate with journalists protected the ability of journalists to both cover military operations safely and ensure that the secrecy of missions remained intact. This ensured that the American public maintained some working knowledge of its military even during contentious conflicts such as the Vietnam War.

As technology improved and journalists gained the ability to immediately communicate with their news organizations, public affairs officials became more important. Military public affairs officials had to learn to operate in the 24-hour news cycle of cable television and provide timely comments about

and reactions to the events that transpired. These officials had to ensure that their commands communicated the specifics of events in order to provide journalists with the military point of view for their stories.

As warfare increasingly intruded into Americans' living rooms through television, public affairs officials had to explain some of the contentious aspects of military operations that had previously remained out of public sight. With conflicts such as Vietnam, Somalia, and the Global War on Terrorism, the impact of warfare on civilians became more apparent. Public affairs officials worked to provide a context for such events. They did this to provide an explanation for the savagery of combat and to ensure that audiences understood the importance of such military operations.

During the Global War on Terrorism, embedded journalists represented the next evolution of public affairs in the U.S. military. These journalists did not have their stories vetted and did not have to rely on a military official for information concerning operations; they witnessed the war and reported what they saw. However, public affairs officials worked to credential and place the embedded journalists; they also worked with commanders to ensure efficient cooperation with journalists. From the informal arrangements that characterized public affairs in the 19th century to the embedded journalists of the 21st century, public affairs in the American military grew from an occasional concern of the commander to one of the most important aspects of maintaining support for military operations.

PUBLIC OPINION ON WAR AND THE MILITARY

The nature and impact of public opinion on foreign and defense policy are among the key issues in debates between realists and liberals. Realists insist that a volatile public opinion, often grounded in ignorance about international realities, provides a poor basis on which to conduct foreign affairs. In his *Essays in the Public Philosophy*, Walter Lippmann, one of the founding fathers of public opinion research, wrote, "Mass opinion has acquired mounting power in this country. It has shown itself to be a dangerous master of decision when the issues are life and death" (p. 20). Few liberals would assert that public opinion should determine foreign policy, but they argue that in the long run, foreign policy cannot and should not consistently run counter to deeply held public preferences.

Presidents and other policymakers have varied rather widely in their views about the legitimacy and utility of public opinion and polling as factors in foreign policy making. Franklin D. Roosevelt and Harry Truman, Democratic presidents of approximately the same generation, held diametrically opposing views. Roosevelt, who had witnessed how the upstart pollster George Gallup had correctly predicted his landslide victory over Alf Landon in 1936, was fascinated by the "new science." During World War II, he secretly hired researcher Hadley Cantril to gauge whether, for example, the public would accept postwar responsibilities, including United Nations membership. In contrast, Truman ridiculed pollsters, perhaps in part because they had uniformly predicted that Thomas Dewey would defeat him in the 1948 election. George W. Bush publicly shared Truman's contempt for pollsters, but he privately relied on several polling firms to help put a "spin" on his policies.

All presidents recognize and act on Teddy Roosevelt's description of the White House as a "bully pulpit" from which to generate public support for his policies. On issues of war, presidents can generally count on "rally round the flag" support—at least during its early stages. A country

that was deeply divided on December 6, 1941, was united by the Pearl Harbor attack the next morning. The declaration of war against Japan was passed unanimously in the Senate and with a single dissenting vote in the House. The decisions to resist North Korean invasion in 1950 and to intervene in Vietnam in 1964 initially received public support, but the mounting casualties and the inability to gain decisive victories ultimately eroded it. Critics called Korea "Harry Truman's War," and the stalemated fighting contributed to Dwight Eisenhower's landslide presidential election in 1952. The Korean War ended with an armistice in 1953 and, most importantly, with the preservation of South Korea's independence. The disastrous Vietnam War divided the country more deeply than any conflict since the Civil War and contributed to growing partisan and ideological cleavages on foreign policy.

The Persian Gulf War, precipitated by Iraq's invasion of Kuwait in August 1990, brought a quick military victory for an impressive international coalition led by the United States and resulted in the expulsion of the Iraqi invaders, with casualties well below some prewar estimates. The initial deployment of forces to protect Saudi Arabia gained wide support, but the decision to invade Iraq was more controversial. The congressional vote on the issue in early 1991 was the closest since the War of 1812. The elder President George Bush's approval ratings after the victory reached an all-time high, but for mostly domestic political reasons he lost his bid for reelection in 1992.

This entry discusses U.S. public opinion of the military and of the wars in Afghanistan and Iraq and looks at the issues of balance and coverage in the media.

The Afghanistan War

The terrorist attacks of September 11, 2001, provided the societal and institutional context for the decisions to invade Afghanistan in 2001 and Iraq 17 months later. The former was a "war of necessity" as there was little doubt about al Qaeda's responsibility for the terrorist attacks, and the Taliban regime, which had provided a haven for that organization, ignored ultimatums to surrender its leaders. As revealed in Table 1, the Afghanistan operations by Central Intelligence Agency and Special Forces units gained exceptionally high public support, reaching 93% shortly after the U.S. forces overthrew the Taliban regime. However, like the British in the 19th

century, the Soviets in the 1980s learned that control of Kabul does not ensure control of the entire country. Nevertheless, Defense Secretary Donald Rumsfeld and most of his colleagues were determined not to get involved in “nation-building” in Afghanistan, and most of the key U.S. personnel were withdrawn to prepare for the forthcoming Iraq campaign.

Public support for the Afghanistan operation remained quite strong through 2009. However, the rising American casualties, the withdrawal of forces by some North Atlantic Treaty Organization allies, and the increasing evidence of vast corruption in the Hamid Karzai regime contributed to the growing disquiet about the war. President Barack Obama’s deployment of 21,000 and 30,000 additional troops in 2009 to cope with the deteriorating military situation received public approval, but sustaining that support will no doubt be heavily influenced by casualty levels and military progress against the Taliban forces.

The Iraq War

The Reagan and Bush administrations had strongly backed Iraq during its long war against Iran, but after the Gulf War, Saddam Hussein was the enemy whom almost all Americans would love to hate. Surveys going back to 1992 found that the majority favored the use of force to remove Saddam from power, but there was little enthusiasm for doing so unilaterally. In response to a Pew poll just days before the 2003 invasion, those in favor of removing Saddam outnumbered opponents by a margin of 59% to 30%, but only 38% wanted to do so “even if allies won’t join.” Sixty percent of respondents to a CBS/*New York Times* survey expressed the view that the United States should “take into account the views of allies before taking action,” whereas only 36% said that this country should do “what it thinks is right no matter what allies think.”

Table 1 Assessments of the Afghanistan War: Was Sending Military Forces to Afghanistan a Mistake? (2001–2010)

Thinking now about the U.S. military action in Afghanistan that began in October 2001, do you think the United States made a mistake in sending military forces to Afghanistan, or not?

	Mistake (%)	Not a Mistake (%)
November 8–11, 2001	9	89
January 7–9, 2002	6	93

Source: Created with data from Gallup Organization surveys.

The successful invasion of Iraq with relatively low casualties received widespread approval. By a wide margin—75% to 23%—those participating in a Gallup survey days after the fall of Baghdad stated that the invasion was “not a mistake.” Table 2—a small sample of the record-setting number of surveys on the war—shows that public support declined steadily starting in 2004. By then, it had become increasingly clear that the reasons for the invasion—Iraq’s alleged possession of weapons of mass destruction (WMDs) and ties to al Qaeda—were fictitious. American inspection teams led by David Kay and Charles Duelfer issued lengthy reports stating that there were no WMDs and no active programs to develop them. Allegations of links between Iraq and the September 11 attackers also proved to be false.

Events on the ground contributed to declining public support for the war. Repeated prewar assertions by administration officials that U.S. forces would be greeted as liberators by most Iraqis; that Shiites, Sunnis, and Kurds would cooperate to create a stable post-Saddam regime in Baghdad; and that Iraqi oil revenues would pay for most if not all of the costs of the war proved to be wishful thinking. The administration had received numerous prewar warnings from intelligence agencies, Secretary of State Colin Powell, Army Chief of Staff Eric Shinseki, and top officials who had conducted the 1991 Gulf War—including Secretary of State James Baker and National Security Advisor Brent Scowcroft—about the dangers the United States would face in post-Saddam Iraq, but those prescient warnings were disregarded, and some of the skeptics were publicly ridiculed (General Shinseki) or fired (Scowcroft, Treasury Secretary Paul O’Neill).

The removal of Defense Secretary Donald Rumsfeld following the 2006 midterm elections, the surge of U.S. forces in 2007, and the counter-insurgency strategy developed by General David Petraeus resulted in improved security and declining American casualties. Multiple surveys revealed that the American public was paying attention, as increasing numbers responded that the situation in Iraq was “going well”; before an uptick of violence in mid-2009, nearly 70% of those taking part in several polls responded favorably. Yet, as shown in Table 2, there was no significant decrease in those describing the invasion as a “mistake.” Is this an example of public irrationality, or does it reflect a

sober understanding of the war’s immense costs and an appreciation of the continuing uncertainties about Iraq’s future? Perhaps a simple analogy is relevant. A smoker who has undergone successful surgery and chemotherapy for lung cancer may respond that his medical situation is “going well” and yet regret his decision to start smoking as a “mistake” and “the wrong thing to do.”

The overall figures in Table 2 fail to highlight an important feature of the public opinion on the Iraq War. When respondents were identified by party, the data revealed partisan differences of unprecedented proportions. President Obama’s appointments of leading Republicans as secretary of defense, national security advisor, secretary of the army, and ambassador to China did little to bridge the partisan gap. The small sample of questions in Table 3 also highlights an “iron law” of public opinion research—the importance of question wording. Because the questions listed in Table 3 asked respondents to consider the *costs* of the war, overall support was lower than in Table 2.

The Media

The media serve as the sole source of information on foreign affairs for most Americans, and the media,

Table 2 Assessments of the Iraq War: Was Sending Troops to Iraq a Mistake? (2003–2010)

In view of the developments since we first sent our troops to Iraq, do you think the United States made a mistake in sending troops to Iraq, or not? (average responses for each year)

<i>Year (No. of Surveys)</i>	<i>% Mistake</i>	<i>% Not a Mistake</i>

in turn, are heavily dependent on government officials for information. A significant issue in democratic governance is the proper balance between the media (the right of citizens to be informed about the policies that are being conducted in their name) and the government (the need for public officials to deliberate some issues, especially on matters of national security, away from constant public scrutiny). Stated differently, should the media serve as “the Fourth Estate,” ever vigilant to possible abuses of power by public officials, or should they faithfully report—and support—administration decisions and policies?

Many presidents and top-ranking officials complain that they have been the victims of unfair media attacks. Yet on issues of military interventions and war, the media have generally “indexed the news”—reporting within the narrow confines of administration deliberations—unless events on the ground generate more critical debates. The Iraq War fits this pattern. During the run-up to the war, even national newspapers with well-earned reputations for investigative reporting, such as the *New York Times* and *Washington Post*, filled their front pages with stories about administration claims concerning Iraq’s WMDs, with little if any coverage of experts who had doubts about the intelligence sources, including the informant “Curveball” and Ahmed Chalabi (an ambitious Iraqi exile of highly dubious reputation), behind those claims. Only much later, when rosy prewar scenarios of a low-cost invasion leading to replacement of the Saddam Hussein regime by a stable, democratic Iraq turned out to be more fantasy than fact, did some of the media coverage of the war take a more realistic turn. This led many officials, including President George W. Bush, Vice

President Dick Cheney, and Defense Department officials Donald Rumsfeld and Paul Wolfowitz, to depict themselves and their policies as the victims of unfailingly unfair and biased media. They conveniently overlooked the unstinting support of media giants such as the *Wall Street Journal*, the Fox News empire, and Rush Limbaugh.

Shortly after 9/11, the Bush administration recruited many retired military officers to support its policies as “experts” on television. The officers were meticulously coached, handsomely rewarded, given extensive opportunities to pursue lucrative private business interests with Pentagon officials, and warned not to disclose their participation in the program, not even to the networks on which they appeared. The program was discontinued after its disclosure in a Pulitzer Prize-winning series of articles by David Barstow, but it seems unlikely that we have seen the last of covert efforts to “manufacture consent” for controversial policies.

Confidence in the Military

Americans have generally held the military in high regard. Since 1973, the Gallup Organization has conducted annual surveys about confidence in major institutions. When the “a great deal” and “quite a lot” responses are combined, favorable assessments of the military have never fallen below 50%. Even during the years following the disastrous Vietnam War, the military ranked second only to “churches and organized religion,” and since 1989, it has ranked first, with favorable ratings ranging from 60% in 1997 to a high of 85% in the immediate aftermath of the 1991 Persian Gulf War. The rating also exceeded 80% in 2002, following the invasion

of Afghanistan, and after the Bush-al-Maliki agreement of 2008 on U.S. troop withdrawals from Iraq.

Whatever the ultimate outcomes in Afghanistan and Iraq, public confidence in the military is likely to remain high, but there may be cautionary warnings in assessments of “churches and organized religion.” Their rankings have fallen sharply, probably as a result of dubious behavior by some church leaders—for example, Pat Robertson and Jerry Falwell described the 9/11 terrorist attacks as God’s just punishment for America’s sins. The cover-up by top-ranking officers of U.S. Army ranger Pat Tillman’s death by friendly fire in Afghanistan, the subject of a well-received documentary movie, *The Pat Tillman Story*, is the kind of conduct that could damage public confidence. Increasing politicization of the military and participation by retired officers in covert propaganda efforts on behalf of administration policies could also reduce confidence in the military as an institution.

Conclusion

What have the Afghanistan and Iraq Wars taught us about public opinion? Despite evidence that the American public is poorly informed about international affairs, the evidence largely sustains the view that, in the aggregate, public opinion generally reflects a sensible rather than randomly volatile assessment of events. Indeed, it suggests that many Americans paid more attention to developments in Iraq than to the administration’s aggressive overt and covert public relations campaigns. Their reactions thus seem to support the “low-information-rationality” thesis propounded by the political scientist Samuel Popkin rather than Walter Lippmann’s depiction of the public as dangerously out of kilter with reality.

That said, this would not seem to be the time for complacency. At what point does “low information rationality” morph into “no information irrationality”? Declining media coverage of international affairs in favor of local news and entertainment, vast cutbacks in news personnel as many newspapers face bankruptcy, and the elimination of geography in many school curricula should be a cause for concern. If democratic theory posits that a well-informed public has a legitimate role in policy making, the media and education systems would seem to have their work cut out for them.

QUADRENNIAL DEFENSE REVIEW

After the collapse of the Soviet Union, numerous studies were undertaken to reshape U.S. defense strategy in a post–Cold War international security environment. Driven by criticism that these studies were merely budget reviews, the U.S. Congress mandated a comprehensive examination of America’s defense needs in the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 1997. Linking each review to the beginning of each newly elected presidential administration, the Quadrennial Defense Review (QDR) would be a secretary of defense–led and chairman of the Joint Chiefs of Staff–reviewed comprehensive examination of U.S. defense strategy, force structure, force modernization, infrastructure, and budget plan. This review would provide direction for the Department of Defense with a common assessment of the security environment, explore approaches to near- and long-term challenges, establish strategic resource priorities, and provide a foundation for strategic planning. While the timing of the QDR would potentially place the review in the midst of a change in presidential administration, the analysis would enable the new administrations the ability to affect the defense budget early in a president’s term. This entry examines the background and content of the QDRs from 1997 to 2010.

Quadrennial Defense Review, 1997

After the November 1996 presidential election, the Department of Defense initiated the first defense

strategy review as mandated by the NDAA for FY 1997. While there was no change in presidential administration, the senior leadership of the department was not appointed until 4 months into the review. However, with participation by the military services, the Joint Staff, and the combatant commands, the Office of the Secretary of Defense published the first QDR in May 1997.

The first QDR entailed a 6-month analysis of threats, risks, and opportunities for U.S. national security and linked outcomes to defense strategy, force structure, infrastructure, modernization, and human capital. Fundamental to this review was the forecast that the United States would remain the sole superpower through 2015, operating in an international security environment lacking a global peer competitor to challenge the U.S. military, marred by regional conflicts, failed and failing states, internal conflict, humanitarian crises, and transnational threats. Therefore, the U.S. military was projected to need forces capable of executing full-spectrum operations from deterrence and small-scale contingency operations to fighting major theater wars.

In light of this security environment, the Department of Defense prepared defense strategy along three lines of effort: (1) shaping, (2) responding, and (3) preparing. The QDR called for shaping strategies to promote regional stability, prevent or reduce conflict, and deter aggression and coercion. The focus of these shaping strategies was the strengthening of core coalitions and alliances to improve the security and stability of friends and allies. The QDR recognized in its second line of effort that the U.S. military needed the ability to

quickly respond to crises to protect its interests. Third, while not faced with a global peer competitor, the U.S. military needed to prepare for unpredictable future security challenges and hedge against potential military rivals.

To implement a strategy of shape, respond, and prepare, the QDR proposed cuts in personnel strength and weapons programs to support near-term shaping and responding requirements and a long-term modernization plan that was intended to reverse a procurement lag that followed the end of the Cold War. As part of the reduction in personnel strength, the QDR proposed an end-strength reduction in the active military of 60,000, reserve forces of 55,000, and civilians by 80,000. Individual service force structure and modernization recommendations included the U.S. Army retaining 10 active divisions, reducing 15,000 active personnel, reducing 45,000 reserve personnel, and accelerating its "Force XXI" modernization plan; the U.S. Navy retaining 12 carrier battle groups and 12 amphibious ready groups, reducing the surface fleet from 128 to 116, reducing the submarine fleet from 73 to 50, reducing 18,000 active personnel, reducing 4,100 reserve personnel, and purchasing 480 joint strike fighters; the U.S. Air Force transitioning one fighter wing from the active force to the reserves, reducing the continental air defense, reducing 27,000 active personnel, and reducing its procurement of F-22 fighters from 438 to 339; the Marine Corps retaining three Marine Expeditionary Force capabilities and accelerating procurement of MV-22 tilt-wing aircraft; and the Department of Defense requesting two rounds of Base Realignment and Closure to consolidate base infrastructure.

Quadrennial Defense Review, 2001

The NDAA for FY 2000 would amend the U.S. Code to require the QDR on a permanent basis. It further amended the National Security Act of 1947 to mandate the formalization of a national security strategy no later than 150 days after the inauguration of a new president and linked the QDR analysis to the president's national security strategy. Affirming the requirements of the NDAA for FY 1997, the QDR would define force structure, force modernization plans, infrastructure, and a budget plan to achieve a low-to-moderate level of risk in implementing a national defense strategy for the next 20 years.

In June 2001, Secretary of Defense Donald Rumsfeld issued guidance to the development of the QDR 2001. Following the inauguration of the new presidential administration, the Department of Defense moved to transform U.S. military capabilities for the 21st century to hedge against uncertain emerging threats, maintain stability in critical regions, and preserve U.S. global leadership. Issuing guidance in a period of relative stability and U.S. military preeminence, the administration believed that the military was shaped to confront the security challenges of the past and sought to transform the military by pursuing new technologies, concepts, and structure to stay ahead of potential competitors. Its defense vision outlined assurance, dissuasion, deterrence, and defeat as its core defense policy goals. Through demonstration of purpose, resolve, and capability, the United States would assure its allies and dissuade potential adversaries from developing threatening ambitions. This transformed force would deter threats and counter coercion or decisively defeat an adversary if deterrence failed.

The bulk of the QDR analysis would be complete prior to the transformative events of September 11, 2001, when terrorists attacked the U.S. homeland. With last-minute revisions in response to the terror attacks, the QDR postulated a security environment where the U.S. would be challenged by asymmetric approaches to warfare with a range of capabilities. Based on this predominately asymmetric threat, the QDR shifted defense planning from a threat-based model focused on specific adversaries to a capabilities-based model focused on how an adversary might fight. This capabilities-based model of defense planning rested on four pillars of transformation: (1) strengthening joint operations, (2) experimenting with new operational concepts and capabilities, (3) exploiting intelligence advantages, and (4) increasing science and technology innovations in defense procurement.

To implement a strategy of transformation, the QDR proposed to retain the 2001 force structure as the baseline to develop a force for the future. The 2001 force structure was judged as presenting moderate operational risk within the expected security environment. Concurrently, the Department of Defense would reorient its overseas basing posture to face global threats in areas outside of the Cold War posture in western Europe and northeastern Asia. The army would accelerate the deployment of

interim brigade combat teams and explore enhancing ground force capabilities in the Arabian Gulf to strengthen the U.S. deterrence posture and improve strategic responsiveness. The navy would increase aircraft carrier battle group presence and explore options for home porting surface combatants in the Western Pacific. The air force was directed to develop plans to increase contingency basing in the Pacific and Indian Oceans and the Arabian Gulf while ensuring sufficient logistical infrastructure to support operations in the Arabian Gulf and the Western Pacific. The Marine Corps would develop new concepts for maritime pre-positioning, high-speed sealift, and amphibious operations while shifting their afloat pre-positioned equipment from the Mediterranean Sea to the Indian Ocean and Arabian Gulf. Finally, the Department of Defense would recommend realignment of special operations forces and maintenance of critical power projection platforms in western Europe and northeast Asia.

Quadrennial Defense Review, 2006

The QDR process was amended again in the NDAA for FY 2003 to mandate the report's submission to Congress in the year after the review is conducted but prior to the submission of the president's budget proposal. With concurrent operations in Iraq and Afghanistan, QDR 2006 would be the first wartime defense strategy review. Recognizing the irregular nature of the ongoing operations, the QDR postulated that the United States entered a period of a "long war" on terrorism requiring the U.S. military to adopt unconventional approaches to warfighting. Linking the review to the National Security Strategy of 2005, the administration urged continuing the transformation of the Defense Department while focusing on the challenges of homeland defense, the Global war on Terrorism, and stability and reconstruction operations.

QDR 2006 described a security environment characterized by four categories of challenges: (1) conventional, (2) irregular, (3) catastrophic, and (4) disruptive. Faced with these challenges, the Department of Defense would focus its resources along four priorities: (1) defeating terrorist networks, (2) defending the homeland, (3) shaping the choices of countries at strategic crossroads, and (4) preventing hostile states and nonstate actors from acquiring or using weapons of mass destruction. Expanding

the landscape of past QDRs, the review concluded that the U.S. military needed to operate globally via specifically identified regions. Furthermore, the military required the capability to operate in long duration counterinsurgency and counterterrorism operations. Therefore, QDR 2006 did not recommend cuts to the force structure but an increase in unconventional capabilities in special operations, psychological warfare, and civil affairs units. To further these capabilities, the QDR recommended building futuristic weapons, increasing the irregular-warfare capabilities of general purpose forces, increasing long-range strike and surveillance capabilities, improving nuclear detection and defenses against advanced biological threats, and focusing on language training in the armed forces. Investing in future capabilities, the QDR retained the army's Future Combat System program, accelerated procurement of navy littoral combat ships—the DD(X) destroyer and attack submarines, and extended the air force's F-22 fighter program. QDR 2006 cited a need to transform business practices to be more flexible with regard to budget, finance, acquisition, and personnel. Finally, the QDR emphasized the Defense Department's need to improve business processes, reduce redundancies, and work more efficiently with state and local agencies.

Quadrennial Defense Review, 2010

The fourth QDR would be the second wartime review of its kind and sixth examination of U.S. defense policy since the end of the Cold War. Exacerbating the challenges of a nation nearly a decade at war, the QDR was conducted as national political leaders struggled to respond to a global financial crisis. QDR 2010 would alter the scope of analysis of previous reviews to include successfully concluding ongoing operations in Iraq and Afghanistan. The focus on both present and future conflicts required the Defense Department to balance priorities between irregular warfare capabilities required of Iraq and Afghanistan and maintaining advantages in conventional warfare.

Consistent with assessments of the security environment of past QDRs, the 2010 review concluded that present and future adversaries would continue to leverage asymmetric approaches to counter the U.S. military's significant technological advantages. Characterizing a complex and uncertain security

environment, the QDR recognized the growing influence of globalization within the international system. Challenges within this system included increasing demands on scarce resources, rapid urbanization, climate change, disease, and demographic tensions with the ongoing challenges of non-state actors as well as the proliferation of weapons of mass destruction.

To counter the challenges of the security environment, defense priorities were established as follows: prevail in today's wars, prevent and deter conflict, prepare to defeat adversaries and succeed in a wide range of contingencies, and preserve and enhance the all-volunteer force. While most of these priorities remained constant over a decade of these reviews, prevailing in current conflicts at the expense of investing in future capabilities and preserving and enhancing the all-volunteer force marked a significant departure from the future force focus of previous QDRs. Reflecting on this significant shift in priorities Secretary of Defense Robert Gates noted at the press briefing releasing the 2010 QDR report that success in future conflicts would depend on the Department of Defense's ability to succeed in the Iraq and Afghanistan wars.

Reflecting on the demands of ongoing operations, QDR 2010 force structure guidance did not include increases in overall end strength but altered the shape and specialization of the force based on the evolving requirements of the current conflicts. It also concluded that as immediate wartime requirements evolve so might the force structure. In the interim, the Defense Department would preserve the force by transitioning to sustainable rotation rates of deployed forces to ongoing operations. While modernization programs were de-emphasized in QDR

2010, individual service force structure and modernization recommendations included endorsing the army's full-spectrum operational concept to prepare for simultaneous offensive, defensive, and stability operations in either conventional or irregular campaigns, the conversion of a heavy brigade combat team to a Stryker configuration, and the addition of two combat aviation brigades; requiring the navy to continue to be a robust forward presence and power projection capability with the ability to defeat rising adversaries' anti-access and area-denial capabilities; requiring the air force to become more survivable, flexible, and versatile to outmatch fifth-generation fighters and anti-access capabilities; enhancing the capacity of special operations forces through the growth of enablers and support assets in general purpose forces; and expanding the capabilities of U.S. cyberspace forces through the fielding of electronic attack capabilities, resilient networks, and enhanced cyber defenses.

R

RADAR

Radar is an acronym derived from the term *radio detection and ranging*. A radar system detects objects using electromagnetic waves transmitted from a directional antenna. Objects, called targets, in the path of the radar wave reflect a portion of the electromagnetic energy back to the radar system's receiving antenna. Data are extracted from the reflected energy to determine target characteristics like bearing, range, altitude, and speed. This entry describes radar systems and their uses in the military.

A basic radar system is composed of a transmitter, a receiver, a directional antenna, a signal processing section, and a user interface for display and control. Most modern radars use the same antenna to perform both transmit and receive functions and require a switch called a *duplexer* to manage the connection between the transmitter-antenna and the antenna-receiver and to protect the receiver from the powerful transmitted signal.

Radar signals reflect best from electrically conductive materials, making radar well suited to detect large metallic objects like aircraft and ships; however, other factors affect radar system design. For example, detection ranges are proportional to strength of the transmitted signal, the size of the receiving antenna, and the radar cross section of the target.

Additionally, the ability of radar to resolve a target of a given size depends on the wavelength of the transmitted signal. Also, some tasks tolerate slow scan cycles, while others require continuous updates without information gaps. Since no single system can

satisfy all requirements, these factors have resulted in many specialized radars.

Contemporary militaries use radar for a variety of functions such as aircraft and ship detection and control; aircraft flight-control systems; maritime navigation and piloting; aircraft, ground, and maritime fire control; weapon guidance and fuzing; aircraft altimeters; area imaging; and meteorological surveillance and measurement.

Pre-1945

Many researchers prior to World War II worked independently on radar technologies. As early as 1886, Heinrich Hertz showed that solid objects could reflect radio waves, and about two decades later, the German scientist Christian Hülsmeyer demonstrated a device capable of detecting a ship shrouded in fog. In 1922, the U.S. Navy researchers Dr. Albert H. Taylor and radio engineer Leo C. Young found that ships passing along the Potomac River between their receiver and transmitter reflected radio waves.

In the 1930s, the need to address a growing threat of attack from the air forced an increased pace in radar research, and while investigating the possibility of building an electromagnetic "death ray," British scientists discovered that they could detect aircraft reliably. Their prototype served as the basis for the Chain Home radar network that defended Great Britain during the Battle of Britain. By the beginning of World War II, radar technology was widely available to many of the warring nations.

Widely used on land and at sea to detect aircraft and ships, advances soon made radars sensitive

enough to detect small targets like periscopes and light enough for installation in aircraft. Some were even small enough for installation in artillery shells (e.g., proximity fuzes). Specialized radars were built for navigation, for precision bombing, and for fire control systems. Simultaneously, scientists developed electronic countermeasures to protect against radar detection.

Cold War and Post-Cold War

In the period after the Second World War, radar technology found many new applications. Large-scale integrated surveillance systems, such as the North American Distant Early Warning System, were built to protect against nuclear-armed bomber attacks, but new opportunities and threats emerged at all levels of warfare to drive radar development.

The evolution of jet aircraft and cruise missiles demanded radar-guided fire control systems for defensive gun and missile installations. As cruise

missile speeds increased, fully autonomous radar-directed defensive fire control systems for last-ditch protection were developed. Radars also changed the face of air warfare as they were fitted into fighter and attack aircraft and into the missiles they carried into dogfights.

By the end of the Cold War period, crowded tactical environments with many small, fast-moving targets fostered the development of electronically scanned phased array radar systems able to automatically search at ranges of hundreds of miles while tracking hundreds of targets. Also during this period, engineers began to explore the use of advanced phased array radars teamed with sophisticated radar-guided missiles to deal with ballistic missiles.

Operations and Planning

Radar is such an integral part of military operations that no phase of planning and execution is untouched. Stealth aircraft are employed specifically for their

A map of North America near the Arctic Circle showing 30 radar sites spread out along the Distant Early Warning Line. Running from Alaska, across northern Canada to Greenland, the line is approximately 3,600 miles long.

antiradar qualities to strike an enemy's command and control infrastructure that often depends heavily on radar use. Satellite-mounted radars survey the battle space to give the commander the intelligence plan and execute the battle plan. Airborne early warning and control aircraft coordinate air operations and help maintain air dominance. Defensive radar systems linked by automated reporting systems provide the force with a comprehensive real-time tactical picture.

Future Developments

Recent radar improvements have been the result of increased computer processing power and innovative signal modifications. For example, the same electromagnetic wave that locates an object can be exploited against the user. To minimize this vulnerability, new radars have been designed that employ special low probability of intercept radar waveforms to make them difficult to detect and track.

Other applications of interest to military users include penetrating radars. The coal mining industry uses ultra-wideband radar for underground navigation. Military uses include detection of land mines and other buried ordnance. Ultra-wideband radar pulses also pass through walls and allow soldiers to see inside structures with high spatial resolution to identify dangerous situations.

Synthetic aperture radar (SAR) systems overcome the limitations of antenna size by using the flight path of an aircraft or satellite to simulate a very large antenna. SAR generates very high-resolution imagery by processing the many radar returns along the radar's trajectory into a single radar image. Military applications for SAR include reconnaissance operations that require high-resolution images covering large areas. Inverse SAR uses the same principle to provide detailed images of a target by processing the changes in the radar return due to the target's own motion.

Among the most technically advanced radar systems is cognitive radar. Cognitive radar uses powerful expert computing systems driven by adaptive algorithms that constantly monitor and build a picture of the operating environment. Based on this environmental database and the system's adaptive qualities, the radar's performance is adjusted to optimal performance from moment to moment. Cognitive radar systems offer better response in cluttered environments, whether due to human-made (e.g., chaff, jamming) or natural causes.

RAND CORPORATION

The RAND Corporation is a nonprofit policy research institution established immediately after World War II. The abbreviation "RAND" stands for "research and development," and as originally conceived, the RAND Corporation provided problem solving and analysis for the U.S. armed forces. The organization has since expanded to service other governments, foundations, nongovernmental organizations, and commercial enterprises on a variety of non-military-related issues. Its history, however, is deeply connected to the development of U.S. defense policy during the Cold War, particularly as it relates to America's nuclear strategy. This entry examines the history and research areas of the RAND Corporation.

As World War II drew to a close, leading officials from the U.S. government and military recognized the contributions that scientists and engineers had made to the war effort, particularly in the development of new military technologies like radar and the atomic bomb. Members of the Truman administration and Pentagon officials argued that the United States needed to maintain and even strengthen the nation's military readiness through the application of science and could not afford to de-escalate following the war. To that end, on October 1, 1945, General H. H. "Hap" Arnold, commanding general of the Army Air Forces, joined with other representatives from the Pentagon and the aviation industry to form Project RAND as a special division of the Douglas Aircraft Company. Project RAND began operations in December 1945 and was placed under the supervision of Major General Curtis LeMay, the Deputy Chief of Air Staff for Research and Development.

The first ever RAND report, titled “Preliminary Design of an Experimental World-Circling Spaceship,” was published on May 2, 1946. The report examined the feasibility of putting human-made satellites in orbit around the earth. The following year, RAND moved from its location at the Douglas Aircraft Plant into new offices in downtown Santa Monica, California. In 1948, RAND separated from the Douglas Aircraft Company and became an independent corporation. Its Articles of Incorporation formally established RAND’s broad goals: “*To further and promote scientific, educational, and charitable purposes, all for the public welfare and security of the United States of America.*” By this time, the staff at RAND had grown to more than 200 researchers in a variety of fields, including mathematics, engineering, economics, psychology, physics, chemistry, and aerodynamics. From the beginning, RAND was conceived as an interdisciplinary research institute, where scientists and experts from divergent areas of study could collaborate on problems of national defense and military technology.

While RAND’s numerous studies had a tangible impact on the day-to-day operations of America’s Cold War defense policy, the methodology and institutional culture of RAND had perhaps an even greater effect on the military establishment. RAND engineers introduced the concept of *systems analysis*, the idea that military strategists should take into consideration not only what happens on the battlefield but also the entire complex set of activities surrounding a particular operation. Indeed, the idea that warfare could be planned for in a methodical, scientific way was a novel and initially controversial idea introduced by the RAND Corporation. RAND researchers believed that the advent of atomic weapons meant that future conflicts could not be field-tested but only simulated. These simulations could only be designed by experts like themselves, who would take into consideration the multitude of factors affecting military operations and view the entire conflict as a whole. The traditional experience of military veterans would simply not suffice in this new world of thermonuclear warfare. This attitude led to conflict between RAND analysts and senior military personnel in the 1950s and 1960s, but the systems analysis approach of the RAND Corporation ultimately prevailed. The height of RAND’s influence over the military came during the Kennedy administration, when Secretary of Defense Robert McNamara instituted a

wholesale restructuring of the defense establishment and promoted systems analysis as the preeminent methodology for American defense planning.

RAND’s researchers were greatly influenced in their systems analysis approach by the celebrated mathematician John Von Neumann, who pioneered the study of game theory in the 1930s and 1940s. Von Neumann served as a consultant to RAND during the 1950s, and RAND researchers applied his theories regarding human decision making to predict the potential outcomes of real-world nuclear conflicts. The application of Von Neumann’s theories eventually led to the creation of political war games—elaborate role-playing scenarios that were designed to help military strategists gain experience “fighting” a nuclear conflict. The RAND mathematics department devised a computer simulation of a Cold War game in 1954, and other, increasingly more elaborate, war games soon followed. Simulating nuclear war through the type of games first developed by RAND became an integral part of the U.S. military’s response to the defense problems raised by nuclear weapons.

The numerous experiments, war games, and simulations carried out by RAND researchers in the 1950s and 1960s led directly to one of the most crucial strategies of the Cold War. An influential military strategist, Herman Kahn, worked for the RAND Corporation and published his most famous work, *On Thermonuclear War*, in 1960. In the book, Kahn argued that a nuclear war was not only feasible but also winnable, provided the United States was truly willing to accept the consequences of a nuclear conflict. Kahn asserted that unless the Soviet Union was convinced that the United States was capable of launching a second strike that would devastate the USSR, the policy of deterrence would never succeed. Kahn’s ideas resulted in the doctrine of mutually assured destruction, which remained the dominant U.S. nuclear defense policy into the 1980s. Kahn, mutually assured destruction, and the RAND Corporation were famously satirized in Stanley Kubrick’s 1964 film *Dr. Strangelove: Or How I Learned to Stop Worrying and Love the Bomb*.

In the 1970s, RAND began to shift its research focus more toward nonmilitary policy analysis as other organizations and businesses began to recognize and subsidize the type of research RAND offered. Today, its research areas span the full range of public policy, from the arts to education, to health care, to transportation, and to infrastructure.

However, according to RAND's 2005 annual report, around one half of RAND's research remains devoted to national security issues.

RANGERS

The Rangers of the U.S. Army are an elite infantry force trained to conduct specialized operations to reinforce the policies of the United States. The Rangers have earned a reputation over time as one of the world's premier fighting forces, their extensive and diverse history dating them back to colonial America. Their fighting spirit and training doctrine are rooted in that history, resulting in the proud and selective force that operates on the modern battlefield. This entry discusses the history of the Rangers and the training and operations of Rangers in the present-day U.S. Army.

Origins of the Rangers

In early America, citizens relied on locally recruited militias for security when lacking the means to organize and equip a formal military. When Native American attacks threatened local populations, the militia attempted to repel the invaders. However, Native Americans implemented unconventional styles of fighting, setting ambushes, plotting raids,

and using their knowledge of the land to move in close to a village and attack without giving the inhabitants prior knowledge of their presence. Militias could not organize fast enough to counter these strikes, so, out of necessity, bands of men were organized to patrol or "range" outside of villages as a first-line defense against attack.

The reconnaissance-based origin of these Rangers carried into the French and Indian War, where, led by Major Robert Rogers, Rangers fought the French army. Rogers's Rangers, as they were called, relied heavily on tactics learned over time from experiences with Native Americans—establishing tight security, utilizing cover and concealment, and effectively communicating plans and contingency plans to maintain flexibility against cunning enemies.

Frontiersmen under Moses Hazen were among American forces that advanced toward Montreal but were thwarted by the British in 1775 during the first year of the American Revolution. Hazen was a veteran of Rogers's Rangers.

Source: : U.S. Army Center of Military History poster series.

During the American Revolution, General George Washington called for “companies of expert rifleman” to be organized into Ranger units. These Rangers differed from the earlier ones, used much less as a patrolling force than as a conventional infantry unit. In the American Civil War, members of John Singleton Mosby’s Confederate cavalry were designated Rangers. Mosby’s Rangers conducted raids that harassed Union forces and captured Union officers and soldiers beginning in 1863. After the Civil War, however, Rangers fell away from the American military scene and did not reemerge for over 75 years.

Birth of the Rangers Battalions

The Rangers known in today’s army were established in 1942, with the formation of the 1st Ranger Battalion. The Rangers’ first commander, William O. Darby, followed orders for his Rangers to first be trained and then to gain experience in combat before being sent to train new soldiers. Eventually, it was determined that the need for a specialized infantry force offset the need for experienced cadre. The diversity of combat scenarios on the battlefields of western Europe, Africa, the Mediterranean, and the South Pacific led several military leaders to support the formation of such units to be trained to handle unique missions falling outside the skill set of conventional units. Thus, the Rangers existed for the first time in their present-day capacity. Several more battalions were created, serving a small part in the Dieppe raid, in North Africa and Italy during the Anzio campaign, as well as at Normandy, scaling the heights at Pointe du Hoc on D-Day.

During the postwar years, the Rangers started to take on even more of their modern-day image. The Korean War brought the first use of the term *Airborne Ranger*, and infantry divisions absorbed the Ranger outfits. Airborne Rangers fought through Vietnam, often in Long Range Reconnaissance Patrol companies, patrolling behind enemy lines and aiding with target acquisition. Rangers existed with the airborne designation from then on, the title symbolizing the Rangers’ transformation into the land, air, and sea organization they are today.

The Vietnam War served the Rangers as a platform to exhibit their necessity in the army. After Vietnam, the Rangers served in various operations

in Iran, Grenada, Panama, Somalia, and Iraq. Between these operations, the Rangers conducted raids, complex attacks, prisoner extractions, hostage rescues, and high-value target strikes, intertwined with countless combat patrols. While an organized Ranger training program existed as far back as the Korean War, the increasingly surgical applications of Rangers made the development of an independent Ranger training facility necessary.

The U.S. Army Ranger Training Brigade was officially established in its current form on November 1, 1987, at Fort Benning, Georgia. The brigade was intended to run the Ranger School, a three-phase course covering 61 days. The course puts emphasis on small-unit leadership and tactics, all under high levels of physical and mental stress to bring students into the most realistic combat setting possible. The Ranger School is considered one of the most demanding military courses in the world. On graduation from the course, students earn the coveted Ranger Tab to wear on their left shoulder.

The Rangers draw much of their training doctrine from their history as an elite fighting force. The tan beret of the 75th Ranger Regiment, the Ranger scroll unit patch, and the motto “Rangers Lead the Way” all have roots in the history of Rogers’s Rangers and the Rangers of D-Day and Vietnam. Their training exemplifies their history as well, with constant reminders of men like William O. Darby in the Ranger obstacle course known as the “Darby Queen.” Constant reminders of their history, and the embodiment of that history in their training and daily lives, keep Rangers aware of and proud of their exclusivity within the U.S. military.

The Future of the Rangers

In the Global War on Terrorism, Rangers continue their work on the fluid modern battlefield in Afghanistan. The Rangers see regular use as a kinetic strike force for securing prisoners and high-value targets, as well as raiding insurgent safe houses in search of insurgents and weapons caches. The counterinsurgency strategy implemented in Iraq and Afghanistan has, however, put the Rangers in much the same role as their conventional infantry brethren. Conducting area security, patrolling, and building rapport with indigenous populations has become routine for all American forces in both theaters,

U.S. Army Rangers parachute from an Air Force C-17 Globemaster III aircraft on August 3, 2009, during a mass tactical jump over Fryar Drop Zone on Fort Benning, Georgia. The jump is the opening exercise of Ranger Rendezvous 2009, a week-long event that provides an opportunity for members of the 75th Ranger Regiment to showcase their tactics and abilities to family members and Ranger veterans.

decreasing the role of direct action warfare only to circumstances that require it for the immediate security of American forces. While the counterinsurgency strategy frequently requires the use of Rangers in this capacity, they are nonetheless indispensable for use as a special operations entity.

The face of battle in the 21st century has increased the need for small, versatile units capable of rapid deployment. The Global War on Terrorism does not always call on the Rangers to act in the role to which they devote most of their training, but their existence in that role is ultimately essential. The military arm of the United States is powerful, but that strength often makes it sluggish when needing to deploy. Having soldiers like the Rangers, trained in special operations with the capability of mobilizing and entering the battlefield quickly, ensures

readiness for whatever mission the United States is charged with carrying out.

RANK

Rank (also known in the U.S. Navy and Coast Guard as *rate*) is the hierarchical concept of authority and seniority in the U.S. military and serves as a baseline for salary rates. It is divided into three categories: (1) enlisted personnel, (2) warrant officers, and (3) commissioned officers. Within each category, more groupings can be made to further indicate function and position. Moving up in rank is known as promotion, while moving down is being demoted, but as a general rule, the level of one's rank in each category indicates the amount of time a person has served in the military. A symbol, known as insignia, indicates the particular rank of an individual. Enlisted personnel typically wear their insignia as patches on their shoulders or upper sleeves, while officers usually wear small metallic pins on their lapels or epaulets. Different color schemes are used depending on the occasion; for example, subdued insignia are usually worn with combat-oriented uniforms, while highly visible insignia are used with formal attire. This entry describes the rank insignia and rank classifications of the U.S. armed forces.

Rank Insignia

The military's current rank system is based on the U.S. Army's incorporation of the chevron in recognition of old European traditions and customs. For enlisted personnel, their ranks are similar in structure and use one or more chevrons, or a variation of the chevron, for their insignia. The exception is the army rank of specialist, which uses only the field of a rotated chevron filled with an image of an eagle similar to the one that appears on the Great Seal. The navy and Coast Guard, which use a combination of diagonal stripes and chevrons to indicate rank, use virtually identical insignias. The U.S. Air Force's insignia are called stripes and are rounded variations of the chevron.

Both warrant officers and commissioned officers use polished or nonreflective metal pins to indicate rank. The warrant officer ranks are indicated by one or more small squares on a rectangular field and offset in color. Commissioned officers use different

symbols from those of warrant officers: gold and silver bars, gold and silver oak leaves, silver eagles, or silver stars. All the branches utilize the same commissioned officer insignia for uniformity and quick identification.

Rank Classifications

Enlisted

The lowest ranks are the enlisted personnel and comprise the majority of the manpower in all the services. The nine separate enlisted ranks are divided into two categories, junior enlisted and noncommissioned officers (NCOs), and have their own titles and insignias. Generally, the junior enlisted are those individuals who have spent the least amount of time in military service, have few duties and responsibilities, and have little authority. Their primary task is to become proficient at their job while successfully acclimating to life in the military. Above them are NCOs. These men and women fill the first- and second-level leadership positions for the junior enlisted personnel beneath them and form the backbone of the military. The highest ranking NCOs, in addition to filling the upper levels of supervisory positions, also serve as advisors and mediators to the unit's commanding officers regarding enlisted issues. Enlisted personnel are addressed by their respective rank and are never saluted.

Warrant Officers

For all of the branches except the air force, the middle ranks consist of warrant officers. They receive their title from having a warrant from their respective branch's secretary initially inducting them into service, although a commission signed by the president is given on promotion to higher ranks. The rank of warrant officer is characterized by those officers who choose to specialize in a specific career or skill while electing to forgo opportunities of commanding large units. Warrant officers are divided into five distinct ranks and each has its own title and insignia. Saluting warrant officers is required, and the manner of address is either according to their gender (Sir, Ma'am, Mrs., Mr., or Ms.) or "Chief."

Commissioned Officers

The uppermost ranks consist of commissioned officers and form the leadership component of

each service. In most cases, officers earn a commission from the president through one of three ways: Reserve Officers' Training Corps, Officer Training School or Officer Candidate School, or by graduating from one of the services academies. Regardless of how the commission is earned, all officers are saluted and addressed by their appropriate rank. In addition to performing their career-specific duties, they also hold supervisory positions over all the enlisted forces. Among the three classifications of the nine officer ranks, company grade officers fill the lowest ranks and serve as the first level of decision making and authority for enlisted personnel. Overseeing them are field grade officers charged with higher levels of decision making as well as many command responsibilities. The upper echelon officers are called general officers and are responsible for strategic decision making. The highest rank usually possible to achieve is either general or admiral. A higher rank of general of the army or admiral of the navy, for example, officially exists but is only used when the nation is at war. Due to a congressional decree, the highest ranking military person ever is George Washington, followed by John J. "Black Jack" Pershing.

RAPE

By definition, rape is nonconsensual sexual assault, typically involving sexual intercourse. Rape is one part of the U.S. Department of Defense's formal definition, included in the 2009–2010 report, of sexual assault that reads as follows:

The term sexual violence, hereby referred to as "sexual assault," is defined as intentional sexual

contact, characterized by use of force, threats, intimidation, abuse of authority, or when the victim does not or cannot consent. The crime of sexual assault includes rape, forcible sodomy, and other unwanted sexual contact that is aggravated, abusive, or wrongful sexual contact, or attempts to commit these acts.

Military rape and sexual abuse can occur in several different settings. Often, rape and sexual abuse can occur between soldiers in the same branch of service either during education and training for combat or out in the field. Additionally, there is also the possibility of the rape initiated by individuals on different sides of a battle, wherein the conquering side rapes the victims of the losing side. The vast majority of military rape victims are women, though there has been a significant increase in male rape throughout the 20th century and into the present day. Though a largely unreported crime, victims of rape have made public feelings of fear, terror, humiliation, and violation of personal space.

Throughout history a rape narrative has formed, largely associated with war crimes and military tactics for thousands of years. Only in the past century has rape become recognized as systemic of warfare, a crime against humanity and classified as punishable. Under the Fourth Geneva Convention in 1949, wartime rape and other sex crimes became explicitly prohibited. This provision was upheld and reinforced by the amendment protocol additions adopted in 1977.

The Department of Veterans Affairs refers to the aftereffects of rape as military sexual trauma (MST), an all-encompassing term that refers to rape, sexual assault, or repeated sexual harassment that took place during the time of service. This broad term aims to include pressured sexual activities, a lack of consent, force, threats, offensive remarks, unwanted touching or grabbing, and unwelcome advances. Since the beginning of the Iraq War, the military has also come to recognize the presence of "command rape," where a victim is promised protection in exchange for being open to sexual relations with a commanding officer.

The increased presence of rape in the military entered mainstream public knowledge in the United States slowly over the course of the 20th century. Always controversial, the topic has been sporadically discussed in media coverage, reports from

the Pentagon, documentary film, popular cultural portrayal, and legal proceedings. In the early 2000s, the U.S. military made further policy strides against sexual trauma instituting an official office to handle reported sexual assault and rape cases. This entry examines the statistics on rape, actions taken by the Department of Defense to address the problem of rape, legal ramifications, and portrayal of war rape and military sexual assault in the popular culture.

Official Stance

During the administration of George W. Bush, the U.S. military began to recognize the growing issue of sexual assault internally and began taking small actions to control the problem. In late 2005, the U.S. Department of Defense officially created the Sexual Assault Prevention and Response Office (SAPRO). The office employs some 1,200 sexual assault response coordinators, chaplains, lawyers, and law enforcement officials to handle the reported crimes. Additionally, the military has trained more than 1 million uniformed personnel and established sexual assault programs at all major bases and installations.

With the creation of SAPRO, the Department of Defense took the designated stance that sex crimes will not be tolerated within the armed forces in any capacity. The formal mission of SAPRO aims to prevent, treat, and enforce accountability of rape and other sexual assaults. Apart from SAPRO, there are organizations like the Military Rape Crisis Center, staffed largely by veterans and survivors of sexual trauma, that work to meet the needs of MST survivors while conducting research on the problem. Currently, Military Rape Crisis Centers are located in Massachusetts, the District of Columbia, and on the U.S. Air Force Ramstein Air Base in Germany.

Basic Statistics

The majority of statistical research on military rape comes directly from the Pentagon, responsible for researching an annual report that details sexual harassment, assault, and trauma primarily within branches of the armed forces (except the U.S. Coast Guard, which is under the Department of Homeland Security). In addition to the research of the Department of Defense and the Pentagon, the U.S. military service academies also publish annual school year reports that detail sexual assaults and rapes involving those in training. These statistics

are required by Congress and cover more than 1.4 million uniformed personnel.

In 2009, the Department of Defense found 3,230 reported cases of sexual assault across all branches of the military, an 11% increase over the previous year. In 2011, the number of reported cases was slightly less than in 2009, at 3,192; however, a Pentagon report released on May 7, 2013, indicated that in 2012 there were 3,374 sexual assault reports. The rate of unwanted sexual contact, including the crimes of rape, sexual assault, forcible sodomy, and abusive and aggravated sexual contact, has increased among active-duty women while remaining the same among active-duty men and among both men and women in the Reserves.

Since 2004, rape and sexual assaults in the military have more than doubled, and at the same time, the Pentagon estimated that about 80% to 90% of rapes and sexual assaults go unreported. The 2013 Pentagon report estimated that 26,000 people in the military were sexually assaulted in the 2012 fiscal year, up from 19,000 in the same period a year before. Thus, sexual assault continues to be significantly underreported. However, the proportion of restricted reports (ones that remain confidential) that converted to unrestricted reports increased from 14% in 2011 to 17% in 2012; the Pentagon saw that as an indicator of increased victim confidence in the military's response to sexual assault.

Historically, statistical evidence on rape and sexual assault in the military was incredibly limited. Almost no records were kept on the matter until the second half of the 20th century. Even into the early 2000s, only scattered records existed detailing individual cases of sexual trauma until Congress passed the order for official military reports in 2002. As of 2010, a lawsuit by the American Civil Liberties Union charged that the Pentagon and the U.S. Department of Defense were refusing to publish the complete findings of the annual reports, instead officially releasing only select statistics to the public.

In Academies

The problem of rape often surfaces within the U.S. military service academies, where cadets undergo rigorous education and training in preparation for combat and career service. The annual public school year reports showed a steady decline in academy rapes up until 2009 when there was a 64% increase

in reported sexual assaults among cadets and midshipmen. The academies only report on sexual assaults owing to the Department of Defense's broad definition. Additionally, the report only includes three of the five military academies: West Point (Army), Annapolis (Navy), and the U.S. Air Force Academy in Colorado.

Despite this substantial increase in assaults within the academies, the Department of Defense concluded that these encounters are rare. The reported academy assaults accounted for less than 10% of the total reports in 2009. In academy environments, less than 13% of women and 2% of men reported unwanted sexual contact.

In Combat

Despite being illegal under the Geneva Conventions, rape and sexual assault still occur in battle settings, both soldier-on-soldier and soldier-on-victim. In this instance, soldier-on-victim rape happens more frequently, a tactic of intimidation and asserting power. Given the cross-country lines and implication of war crimes, reports on soldier-on-victim rape are scarce and unreliable.

In terms of soldier-on-soldier, statistical data on combat setting rape are harder to separate from the general statistics contained in the released reports, factoring in a wider range of victims, locations, and reporting techniques. However, it is clear that the battleground in Iraq and Afghanistan is where the aforementioned "command rape" first appeared, highlighting the presence of soldier-on-soldier sexual assault even in the field. Since the onset of these wars, reported rape cases in both combat zones increased approximately 20% from 2007 to 2008. Additionally, there is a higher instance of gang rape in combat settings, with almost 14% of reported cases involving multiple persons and the victim.

Legal Ramifications

The legal prosecution of rape is one of the most controversial issues within the military and American public. The most common charge against the military remains that limited prosecution follows reported cases. A large factor in the prosecution of rape comes from the reporting techniques. The military unofficially employs a lengthy survey to determine accuracy and truthfulness, collects physical evidence when possible, and documents a full

report. Nearly one third of victims choose not to complete the reporting process, thereby closing the case immediately.

The 2007 Pentagon report showed that more than 50% of fully reported rape investigations resulted in no action. Officially, only about 8% of reported cases led to prosecution. In the event action was taken, only one third of the investigations resulted in courts-martial. The other two thirds of action was nonjudicial, recommending the accused be sent to counseling, transferred to another unit, or discharged. Some 80% of those convicted were ultimately honorably discharged.

When the reported rape results in a court-martial, military sentencing for sexual assaults is often much less severe than state laws. According to the Associated Press in 2009, West Point cadet Kyle Newman faced two separate rape charges, one within the academy and one in neighboring Highland Falls. Newman was found guilty in May 2010, and sentenced to 3.5 years confinement and dismissal from the army. New York State law stipulates that each rape charge carries 12.5 to 25 years in prison.

Public Portrayal

Despite a historical presence, the rape and sexual assault narrative has seen limited public portrayal since the advent of film and television in the early 20th century. There are a few notable exceptions, each of which has stirred individual controversy on release, exposing audiences to the possible atrocities of war and military service.

The public's first real exposure to military rape came around World War II when the idea of sexual assault as a battle tactic began to permeate news stories and popular culture. Events like the Rape of Nanking were covered in films like the 1944 documentary *The Battle of China*, Volume 6 of 7 in Frank Capra's U.S. government-commissioned propaganda series, *Why We Fight*. This film series was aimed primarily at soldiers to inspire them to fight and was later shown to the American public to rally support for U.S. involvement abroad. This government-issued film series helped control the American public's understanding of war rape and sexual assault.

After World War II ended, war rape began to find its way into popular culture through films like *Two*

Women starring Sophia Loren, which showed an Italian woman and her daughter fleeing the city during World War II. After the liberation, the pair head back toward Rome only to be captured and gang-raped by some Moroccan soldiers serving under the French forces. By 1960 standards, the rape scene was quite controversial, highlighting the atrocities of war in a realistic way that struck a chord with audiences.

Since *Two Women*, war rape and military sexual assault have appeared in only a few films and documentaries. It appears that filmmakers typically avoid showing the graphic topic in a direct way and rather allude to rape indirectly. However, in 2007, the French filmmaker Pascale Bourgaux spent over a month interviewing U.S. women raped during their military service. The documentary, *Rape in the Ranks: The Enemy Within*, follows the stories of four women who suffered MST. The documentary has, in effect, been banned from the United States where it has no actual release and has only been shown publicly at a handful of independent screenings.

Conclusions

Rape under military circumstances involves a lengthy historical narrative that entered into public consciousness in the 20th century. Throughout the second half of the 20th century, rape became globally recognized as a problem associated with warfare, and the Fourth Geneva Convention moved to condemn its practice. As a result of concern over a rise in sexual traumas, the U.S. military addressed the situation by implementing military training procedures, annual reports, and a designated office to enforce the Department of Defense's policy on sexual assault. Despite these initiatives, the issue of MST continues to persist not only in periods of warfare but during military training and service. Public criticism resonates from how military personnel are charged and the subsequent legal actions taken against them in matters of rape and sexual assault. Public understanding of the issue is largely shaped by films, scholarly texts, and journalistic reportings.

RAPID DEPLOYMENT FORCE

A rapid deployment force (RDF) is typically configured as an elite body of troops that is designed to move greater distances in shorter times than their counterparts in traditional armed forces. Because of time-distance considerations, such a force will likely be composed of light infantry, airborne or air mobile troops, and a mix of Special Forces, with little organic air, armor, or artillery support. To remain in action for very long, the force will require quick resupply and reinforcement. This entry describes the evolution of U.S. RDFs and looks at variations of the RDF concept worldwide.

The concept of a light force capable of agile and rapid employment is not unique to modern times. But the notion of *rapid deployment over great distances* came of age only with the advent of long-range jet transport aircraft. And sustainment of RDFs became feasible only with land-based and/or afloat prepositioning of armor, ammunition, vehicles, and even foodstuffs and water, together with continuous air resupply. To augment self-sustaining troops arriving by long-range military airlift, other rapid deployment personnel are typically flown in, sometimes on civilian airliners, to "marry up" with prepositioned supplies and equipment. Timely arrival of tactical air cover may be enabled by the use of an "air bridge" of tanker aircraft, and naval

support of operations will depend on proximity and types of ships immediately available.

Variations on the Concept

Theoretically, there are many variations on the RDF concept. A range of real-world examples provides a spectrum of operations from high-end global-reach deployments described above, to regional deployments involving multinational forces in the middle of the spectrum, to neighboring state—or even intrastate—deployments at the lower end.

The most credible global-reach RDF capability now resides within the U.S. military, about which more is given below. A future global-reach capability might be established by the United Nations under auspices of the Military Staff Committee authorized by Chapter VII, Article 47 of the Charter. Despite persistent advocates, however, all efforts to establish a standing UN RDF have thus far proved unsuccessful, and prospects are unpromising.

A number of regional RDFs have taken the field, including one sponsored by the Economic Community of West African States, employed successively in the Ivory Coast and in Liberia. Another regional initiative has been taken by the six states of the Gulf Cooperation Council that recently agreed to create a combined RDF to address security threats in the Persian Gulf.

European states have long been involved in planning for, and occasionally deployment of, multinational forces that can be characterized as RDFs.

The so-called battlegroup concept that has been sponsored under auspices of the Common Security and Defence Policy of the European Union appears to be designed to meet intraregional rather than extraregional contingencies. Meanwhile, under auspices of North Atlantic Treaty Organization (NATO), an Allied Command Europe Rapid Reaction Corps (ARRC) has been established, which has provided components to the “NATO Response Force” in Afghanistan.

ARRC assumed command of HQ International Security Assistance Force IX in Afghanistan. ARRC maintains the collaborative effect between International Security Assistance Force forces and the local population.

Source: © ARRC/NATO.

Finally, a considerable number of individual states have established so-called RDFs, including Argentina and Great Britain, erstwhile belligerents in the Falklands War.

The American RDF Concept: Origins and Evolution

A presidential directive (PD 18) in 1977 called for the establishment of a mobile military force that would not divert assets from NATO or from South Korea. However, it was not until after the Iranian revolution of 1979 that a concerted effort was made to actually establish the force. President Jimmy Carter announced in October of that year the formation of an American RDF capable of operating anywhere in the world.

Following the Soviet invasion of Afghanistan in December 1979, which prompted the enunciation of the Carter Doctrine in January 1980, the RDF concept of operations was soon focused on the Persian Gulf region. Carter asserted that the Gulf was an area of vital interest to the United States and, furthermore, that any outside attempt to gain control of that oil-rich area would be “repelled by any means necessary, including military force.” Clearly intended to deter further Soviet adventures in Southwest Asia, the Carter Doctrine created an intense sense of urgency within the American military establishment to develop the capability, then largely lacking, to provide teeth for the president’s warning.

Already in existence was the U.S. Strike Command that had been established in 1961 at MacDill Air Force Base as a unified combatant command capable of responding to global crises. In 1972, Strike Command had been redesignated as the U.S. Readiness Command (REDCOM). The commander of REDCOM was directed in 1979 to establish the Rapid Deployment Joint Task Force (RDJTF) headquarters as a separate subordinate command within REDCOM. Defense Secretary Harold Brown formally established the RDJTF in March 1980, and, in 1981, Defense Secretary Caspar Weinberger announced that the RDJTF would evolve into a separate command with specific geographic responsibilities. To complete the metamorphosis, the RDJTF became an independent unified command in 1983 as the U.S. Central Command. (REDCOM was subsequently replaced by the U.S. Special Operations Command in 1987.)

The first major test of Central Command’s concept of rapid deployment operations came in August 1990 when Iraq invaded Kuwait. For several anxious days, U.S. quick response forces were flown into eastern Saudi Arabia, first to deter, and then if necessary to defend against, an Iraqi thrust out of Kuwait south into the Saudi oil fields. After reaching a critical mass, the rapid deployment gave way to a systematic, massive buildup that later culminated in Operation Desert Storm in January 1991.

In retrospect, the early phase of Operation Desert Shield during the month of August 1990 was the *first*, and arguably, the *only* full-scale test of the U.S. RDF concept. Subsequent interventions by U.S. military forces abroad have certainly involved rapid deployments over long distances—the hallmark of RDF operations first conceived and rendered technologically feasible over four decades ago. The ongoing “transformation” of the American military since the end of the Cold War has emphasized lighter forces, greater mobility, and the overarching imperative that virtually all combat forces must now be “expeditionary” in design and employment doctrine, thus broadly institutionalizing the RDF concept across all the U.S. armed services.

RAYTHEON

Raytheon is an America-based, global corporation that stands as one of the largest defense contractors for the U.S. government. It is the largest producer of guided missiles in the world, as well as the fifth largest

military contractor overall. It employs roughly 72,000 people worldwide. This entry traces the history of Raytheon and discusses its products and technology.

Raytheon Company formed in 1922, when two alumni from Tufts University, Lawrence K. Marshall and Vannevar Bush, partnered with Charles G. Smith to found the American Appliance Company in Cambridge, Massachusetts. The firm began with a focus on refrigeration technology. From there, the company quickly moved into the emerging field of radio and developed the Raytheon tube, from which the company then took its name. Literally, the name Raytheon translates as “light of the gods.” They enjoyed great success after changing their center of attention in 1925 to radio technology. The company continued to make consumer electronics as their chief product line through the remainder of the decade and into the 1930s. The company expanded, acquiring Q.R.S. Company, a major manufacturer of electron tubes and switches, in 1928. In addition, it added Acme-Delta Company in 1933, a producer of transformers, power equipment, and electronic auto parts.

World War II

With the outbreak of the Second World War and American participation in the conflict, Raytheon grew to become a major defense contractor with a significant role in radar technology. Radio detection and ranging, or radar, systems were originally developed by British corporations. One of these, the A. C. Cossor Company, developed radar in the 1930s and was the main producer of this technology for the British Chain Home Defense network. As a result of wartime demands, the company’s production capability was stretched to the maximum. With U.S. entry into the conflict, Raytheon was selected to take on the additional demand that Cossor could not meet. This came about as the result of a contract from the U.S. government and a partnership with the Massachusetts Institute of Technology’s Radiation Laboratory. The primary item produced by Raytheon was the magnetron tube, a key component used in radar sets. Within a few months after receiving the contract, Raytheon began to mass produce the components in order to help meet wartime demand.

Cold War

With the end of World War II, Raytheon began to broaden its electronics development wing, at the

same time enhancing its role in the defense industry. Initially, the company accomplished these goals through the acquisition of various other concerns. Among the businesses acquired by Raytheon at this time was the Submarine Signal Company, then a major manufacturer of maritime safety equipment, including guidance systems. The above acquisition aided Raytheon in its development of the first missile guidance system capable of hitting a flying target. The company began production of the system in 1948. Two years later, its Lark missile became the first to destroy target aircraft in flight. This accomplishment led to contracts for the firm to develop an additional system, the air-to-air Sparrow missiles. Likewise, these innovations drove development of a third weapon system, the ground-to-air Hawk missiles. During the same period, the company embarked on the manufacture of transistors as well as radio and television transmitters. These products were, to some extent, generated by the technology developed in their guidance systems programs. In 1959, Raytheon further expanded through the acquisition of Apelco Applied Electronics and changed its name to the Raytheon Company. In 1961, they formally merged with the British electronic company A. C. Cossor, formalizing a partnership that had existed going back to World War II. Cossor was still a member of the Raytheon group of corporations as of 2012.

Through the 1960s, while it continued as a major defense technology corporation, Raytheon branched out into the consumer appliance industry. In 1965, for instance, the corporation diversified into the refrigeration industry with the acquisition of Amana Refrigerators, Inc. The firm quickly combined the technological expertise it held in electronics with the new investment in consumer appliances with important results. The most significant development to derive from this fusion came in 1967 when the company began marketing the first tabletop microwave ovens under the Amana brand name. The company continued to manufacture both consumer electronics and military hardware through the 1960s and 1970s.

The 1980s witnessed a major change in the corporate direction of Raytheon as it purchased Beech Aircraft Corporation. The acquisition of the aircraft firm initiated a movement within the company to a renewed interest in air power and air defense technology. The shift in direction engendered by

this purchase manifested in the development of the Patriot missile defense system.

Post-Cold War

Raytheon supplied numerous guided missile systems to the U.S.-led coalition in the Persian Gulf War, 1990–1991. The most famous of these systems was the Patriot missile, which achieved significant results during the conflict. The success of the coalition in this conflict generated fresh orders for Patriot missile systems.

By the same token, it served to drive the company in a new direction. Through the 1990s, Raytheon moved to focus more of its efforts in the defense industry. As a result, it began acquiring a number of other technology firms. At the same time, Raytheon began to divest itself of some commercial subsidiaries, the most prominent of which was Amana Refrigerators. All of these measures were aimed at establishing Raytheon as the preeminent corporation in the defense electronic industry.

Conclusion

From its inception in the early 1920s, Raytheon stood out as a major technology firm. Soon after its creation, the company began to serve as an important contributor to the national defense of the United States. Through the Second World War and after, Raytheon worked to maintain its role in the defense industry as well as expand its consumer appliance division. With the return to the company's focus on military hardware, Raytheon continues to be a significant corporation in the defense industry, providing major components for guided missiles.

REALISM IN INTERNATIONAL RELATIONS

Realism is a school of thought in the study and practice of international relations. Realists understand international politics as a struggle among sovereign states for power, measured in terms of military forces, wealth, natural resources, population, and territory. Sovereign states exist in an anarchic system in which rules and agreements, including formal treaties, are easily broken. No super-sovereign world government exists to punish states that violate treaties and international law, so states must rely on themselves to ensure their survival in a competitive, dangerous world. Survival is the *sine qua non* of foreign policy; governments that interpret the national interest in alternative ways do so at their peril. To survive, states must arm themselves—or secure well-armed allies—to deter potential aggressors and to defend their territories, populations, and interests against undeterred attackers. Security thus requires military power; in the Latin adage, “*si vis pacem, para bellum*” (if you wish for peace, prepare for war). This entry discusses the principles of realism and the views of prominent realists.

Realists are pessimistic about and even dismissive of international organizations like the United Nations and emphasize the failures of such organizations to prevent aggression and war. One commonly cited example is the League of Nations, the post-World War I organization intended to maintain peace but that failed to halt Japanese, Italian, and German aggression and collapsed shortly before World War II. Similarly, many realists believe that progress is virtually impossible—that human nature or the anarchic condition of the international system condemns international relations to be an endless struggle for power or security.

Hans Morgenthau, the modern godfather of realism, argued that the international struggle for power has and will continue to play out in predictable ways, most notably in the system's tendency toward a balance of power—a rough equilibrium among the Great Powers (the most powerful states in the system), which seek to maintain their status

and prevent the emergence of a preponderant power capable of imposing hegemony. These states pursue greater power for themselves but also seek to limit or counteract competitors' military capabilities by "balancing" against other powerful states, often by forming alliances or coalitions against any state that threatens to become the singularly preponderant power in the system; for example, Napoleon's bid to conquer continental Europe provoked coalitions of other European powers opposed to French hegemony.

Realists prescribe alliance or coalition building as one method of balancing power; an alternative method is to increase one's own armaments to keep pace with or outweigh the capabilities of potential adversaries. Many realists consider "internal balancing" more reliable than alliances—which, like other international agreements, are easily broken. Critics, however, argue that increasing armaments, even when motivated strictly by defensive concerns, can lead to arms races (like the Cold War nuclear arms race between the United States and the Soviet Union) and security dilemmas in which one state's ostensibly defensive measures are misinterpreted by others as aggressive and indicative of hostile intentions.

Critics consequently argue that realist prescriptions are warlike, because preparing for war brings war, not peace. But realists do not necessarily condone frequent warfighting; rather, most realists counsel prudence, diplomacy, and judicious use of power resources. Government leaders, military officials, and scholars who espouse realist principles do not hesitate to advocate military force when necessary—but only when necessary. Foreign adventurism risks the squandering of blood and treasure, which should be marshaled to protect the state and its interests in a worst-case scenario. In this vein, the prominent realist scholars John Mearsheimer and Stephen Walt argued in 2003 against a U.S.-led invasion of Iraq on the premise that war is wasteful and unnecessary, especially when other coercive methods such as containment and deterrence appeared sufficient.

Realists agree that statesmanship requires prudence, but not everyone agrees on realism's premises and implications—and indeed, this wide-ranging and inclusive school of thought encompasses many variations. For example, Mearsheimer's "offensive realism" asserts that the system's most powerful states, Great Powers, continually seek to expand

and maximize their power at their rivals' expense; in contrast, "defensive realists" argue that many states are content to preserve the status quo, which in turn is threatened only by a small number of revisionist states seeking to expand and move up the ranks of the powerful in the global arena. Walt's "balance-of-threat" theory, for example, posits that states balance against the state that is most threatening, not necessarily the most powerful.

Some realists' claims that states balance against only those states that are both powerful and revisionist (or "threatening") permits this school of thought to include theories of power preponderance, which allows for the existence of a hegemonic leading state far more powerful than any other in the system—a role many have ascribed to the United States during the post-Cold War era. Theories that distinguish states on the basis of how threatening they appear to be also raise questions about what makes a state threatening to others, which in turn has opened doors to variations on realism that involve perceptions—internal, political, and economic factors—and other complicating variables that more parsimonious structural realists like Kenneth Waltz reject as superfluous. But most realists—academics and policymakers alike—share Waltz's emphasis on rational calculations of the national interest rooted in power as a means of ensuring survival in a dangerous world.

Realists generally agree that states require arms and allies, that coercion and war are necessary methods of influence in international relations, and that states cannot rely on international law, international organizations, or human progress to ensure their survival. In theory and practice, realists maintain that preservation requires states to prepare for war.

RECONSTRUCTION

Reconstruction was the extended process of returning the ex-Confederate states into the Union in the wake of the American Civil War. The Civil War lasted from 1861 to 1865, but the reconstruction of the South was already under way by 1863 as Union authorities considered the fate of the occupied portions of the Confederacy. Reconstruction formally concluded in 1877 with the removal of the last federal soldiers and the restoration of the Democratic Party's control in all of the former Confederate states. Key issues of Reconstruction included disagreements among Unionists regarding plans for the South, conflicts between Black and White Southerners' postwar expectations, and the political struggle of Republicans to build a party in the South and maintain their momentum in the North. The use or disuse of the U.S. military in resolving each of these challenges provoked considerable debate. This entry describes the development of Reconstruction during the Civil War, the shift from presidential reconstruction to congressional reconstruction, the rise of Southern Republican state governments, the return of Democratic control in the South, and the end of Reconstruction.

Wartime Reconstruction

In 1861, most Northerners and Southerners assumed that the Civil War would be a relatively brief affair, and few expected any radical social transformations. By 1863, however, "the Southern Question" and "the Negro Question" became pressing concerns. The Union Army occupied substantial portions of the Confederacy, thousands of Black Southerners pressed their claims to freedom by flocking to Union Army lines, and President Abraham Lincoln's January 1863 Emancipation Proclamation declared an end to slavery in areas still in rebellion. Lincoln's priorities included ending the increasingly bloody war, restoring the Union as quickly as possible, and gaining White support for emancipation. In December 1863, the president outlined a plan offering a full pardon and the restoration of property

to White Southerners who swore an oath of allegiance to the United States and its laws, including the Emancipation Proclamation. He also proposed the readmission of any seceding state if 10% of that state's prewar voting population took a loyalty oath and approved a new state constitution prohibiting slavery. For many Northern Republican congressmen, however, Lincoln's Ten Percent Plan appeared too lenient. In 1864, a Republican faction that became known as the Radicals passed the Wade-Davis Bill, which required 50% of a seceded state's White male citizens to pledge their loyalty before the state could draft a constitution and gain readmission to the Union. The Radicals hoped that these strict measures would delay the process of restoration of property to White Southerners who swore an oath of allegiance to the United States and its laws, guarantee Black equality, and provide a foundation for fundamental changes in Southern society. Lincoln feared that the bill would undermine any hope of building political influence among Southern Whites, and he refused to sign it, resulting in a pocket veto (under the U.S. Constitution, the president at the end of a congressional session can veto a law by not signing it, and he does not have to issue a formal veto message).

By the spring of 1865, the Confederate's military situation was desperate, the U.S. Congress had passed the Thirteenth Amendment to the Constitution abolishing slavery, and the amendment was well on its way to ratification by the states. However, there was little other consensus among Unionists regarding the course of Reconstruction, or even whether Congress or the president had ultimate authority over the process. Most Democrats and some conservative Republicans argued that secession was illegal and that there was no need to formally readmit the Confederate states since they never legally left. Conversely, moderate Republicans and Radicals asserted that the Confederate states forfeited their rights by seceding and legally should be treated as U.S. territories under the authority of Congress. Most moderate Republicans favored the extension of Black suffrage and civil rights as well as some limitations on ex-Confederate suffrage, while Radical Republicans additionally insisted on military oversight for ex-Confederate states. Some Black Southerners and Northern Radicals even favored redistribution of land from former Confederates to former slaves, a bold move with wartime precedent. In January 1865, General William T. Sherman issued

Photomontage of members of the first South Carolina legislature following the Civil War, mounted on card with each member identified.

Source: Mercer Brown. Courtesy of the Library of Congress.

Special Field Order 15 offering plots of abandoned farmland in portions of South Carolina and Georgia and the use of government mules to former slaves.

Ultimately, neither the Union military nor Congress endorsed the wholesale confiscation and redistribution of Southern property, but the

government took unprecedented actions to respond to the war's devastating and dislocating effects on Southern society. In March 1865, Congress established within the War Department the Bureau of Refugees, Freedmen, and Abandoned Lands—popularly known as the Freedmen's Bureau—to aid destitute White and Black Southerners. Congress initially mandated the Freedmen's Bureau to operate until the end of the war and for a year thereafter, but the agency was renewed in 1866 and was not discontinued until 1872. Agency officials provided food and clothing, supported Black schools, and investigated and tried cases of physical abuse. The Freedmen's Bureau also oversaw labor contracts between planters and former slaves in an attempt to forge economic stability in the postemancipation South. The agency provided some degree of physical relief, justice, and order to a turbulent situation, but it also drew criticism from all sides. Former masters sometimes resented the agency's interference in local affairs and accused agents of coddling freed people. On the other hand, Black Southerners sometimes accused the government of valuing stability over equality or justice, and their hopes for a broader redistribution of property remained unfulfilled.

From Presidential to Congressional Reconstruction

Two developments in April 1865 quickly lent the questions of Reconstruction renewed urgency: (1) the primary Confederate armies surrendered, effectively bringing an end to the war and (2) Lincoln was assassinated, elevating Tennessee Unionist Andrew Johnson to the presidency. Johnson had long been an outspoken foe of Southern planters, and many Radicals thought of Johnson as an ally in their plans for Reconstruction. But in the spring of 1865, Johnson asserted executive control over Reconstruction, issued widespread pardons to Confederate officials, and proposed to quickly reconstitute Southern state governments without requirements for Black voting or civil rights as long as the states recognized emancipation. Johnson hoped that such measures could forge a coalition of Northern Democrats, conservative Republicans, and Southern Unionists to shape postwar politics. Most Southern states accepted Johnson's lenient terms, but they also sought considerable continuity with past patterns as they rebuilt their state governments. In late 1865,

Southerners elected prominent ex-Confederates to Congress and enacted Black Codes to control many aspects of the newly freed peoples' lives, including restricting the movement of Black workers, outlawing gun ownership, and instituting apprenticeships for Black children. From the perspective of Black Southerners, such postwar developments looked far too similar to the conditions of the preemancipation South. In 1866, White rioters in Memphis and New Orleans unleashed appalling violence on Blacks who dared to challenge White authority.

The apparent intransigence of the ex-Confederates outraged many moderate Republicans and Radicals, and about a year after the war had ended, Congress launched a more aggressive campaign of Reconstruction. Congress countered the Black Codes by passing the Civil Rights Act of 1866 to specify protections guaranteed to a national citizenship. Johnson vetoed the act, but Congress overrode the veto and incorporated elements of the civil rights law into a constitutional amendment. Congress passed this as the Fourteenth Amendment in 1866, and it was ratified in 1868. Radicals' conflicts with President Johnson intensified in March 1867 when Congress enacted a series of Military Reconstruction Acts over Johnson's vetoes. The acts divided the ex-Confederate states (excluding Tennessee) into five military districts with the objectives of guaranteeing Black Southerners' voting rights, establishing Republican regimes to create and enforce new state constitutions, and maintaining Republican control of Congress. In each military district, Union generals were given authority to hold elections and rule on voter eligibility. Radicals also passed the Tenure of Office Act to prevent the president from removing officeholders without the Senate's consent. Johnson argued that Congress had overstepped its authority, and in 1868, he deliberately violated the Tenure of Office Act by removing the Radical secretary of war, Edwin M. Stanton. The House of Representatives responded by impeaching Johnson. Ultimately, the Senate fell one vote short of the two-thirds majority needed to convict Johnson, but control over Reconstruction had shifted decisively to Congress. In the 1868 presidential race, the incumbent Johnson could not even secure the Democratic Party's nomination, and the Union war hero and moderate Republican, General Ulysses S. Grant, won the election. Large Republican majorities in both houses of Congress allowed Radicals to further advance their

agenda in February 1869 by passing the Fifteenth Amendment, guaranteeing voting rights regardless of race “or previous condition of servitude.”

The Rise of Southern Republican State Governments

Under the protection of the U.S. military, between 1867 and 1870, Republicans gained control of Southern state governments, created new state constitutions, and gained readmission to the Union. The new constitutions included a variety of reforms, including provisions for public education, universal manhood suffrage, and protection of civil rights. The new Republican state governments depended on the support of a coalition of Black Southerners with native White Southerners and a small contingent of transplanted Northerners. White Republicans, derisively known as “scalawags” and “carpetbaggers” by their opponents, dominated much of the Southern Republican leadership, but African Americans constituted the largest part of the party. In South Carolina, Mississippi, and Louisiana, Blacks were an outright majority of eligible voters, and the formation of Union Leagues to mobilize Black voters became key to establishing and maintaining Republican governments. Black Southerners also aspired to hold office, and between 1867 and 1877, more than 600 African Americans served in state legislatures. Under Republican leadership, state governments were far more active than prewar governments. The states sponsored railroad development and constructed schools and hospitals. Black and White Southerners alike were given unprecedented access to medical care, legal counsel, and debt relief.

The state Republican governments provided objective improvements to the quality of life in the South, but some policies provoked resentment. The expansion of government services was expensive and resulted in significantly higher state taxes. Although corruption and waste were a part of Southern politics, both before and after Reconstruction, many White Southerners viewed the dramatic increase of revenue under the postwar Republican regimes as evidence of large-scale public graft. Racism also undermined Republican rule. Many Whites were offended by the extension of Black political and civil rights, and Democratic appeals to White solidarity were reinforced by violence targeting Black

Southerners and their White supporters. Southern Republicans themselves were divided by racial issues with some Whites hesitant to grant leadership and office holding to Blacks, and some Blacks questioning whether they should commit to such reluctant White allies. As a consequence, Republican dominance was relatively short-lived in parts of the South, with Democrats regaining control of Tennessee and Virginia in 1869, North Carolina in 1870, and Georgia in 1871.

The Return of Democratic Control in the South

The campaign of “Redemption,” as Democrats called their return to power in Southern states, frequently exploded into violence as White vigilantes across the South employed terror to intimidate White and Black Republicans. Under the leadership of the famed cavalry general Nathan Bedford Forrest and other ex-Confederates, the Ku Klux Klan became virtually a paramilitary auxiliary of the Democratic Party. Republican political leaders, the Union Leagues, and new institutional symbols of Black assertiveness, such as Black churches and Black schools, were primary targets of “KuKluxism,” as violence from a variety of groups became known. Protecting freed people and the young Southern Republican organizations soon became a major challenge. Black and White army veterans provided leadership for Union Leagues, which often assumed a paramilitary character to counter the Klan violence. But Republican leaders recognized the need for more formal institutions to keep the peace. Republican governors occasionally mustered state militias to meet these threats, but such bodies were not always properly equipped for counterinsurgency operations, and maintenance costs further strained state budgets.

Southern Republicans sometimes sought federal aid, and the national government responded with a variety of measures. The Enforcement Act of 1870 and the Ku Klux Klan Act of 1871 permitted the federal government to intervene more aggressively and deploy military forces to protect citizens’ political and civil rights. The mobilization of federal military resources and authority to support Southern Republicans faced its own problems, however. Although constituents sometimes begged for protection against imminent violence, Southern Republican

leaders were often cautious about soliciting outside support. Federal intervention might prop up a regime, but state leaders recognized that the presence of a standing army could also undermine their legitimacy and the long-term prospects for building the Republican Party in the South. For their part, Union officers sometimes faced complicated questions of jurisdiction and were typically reluctant to overreach their authority. Federal garrisons tended to be spread relatively thin and sometimes lacked the mobility necessary to effectively counter guerrilla violence.

Furthermore, Northern interest in and commitment to Reconstruction waned by the 1870s. The Freedmen's Bureau from its start was conceived as a temporary agency; in 1869, Congress reduced its

role to supporting education and distributing payments to veterans, and in 1872, Congress discontinued the agency altogether. Meanwhile, in the late 1860s, the national economy boomed. Much wealth was poured into development of the western United States, where conflicts with Indians also seemed to demand military attention. Many Republicans poured political support and personal investment into the development of railroads, mining, oil drilling, and manufacturing. While the economic boom led to great wealth, it also produced spectacular scandals as congressmen and federal officials at a variety of levels, including Grant's vice president, were implicated in schemes such as manipulation of the stock market and exchanging government favors

President Ulysses S. Grant signing the Ku-Klux Force Bill in the president's room with Secretary Robeson and General Porter, at the Capitol, April 20, 1871.

for stocks. Corruption was rife among Democrats as well, with “Boss” William M. Tweed’s political machine in New York City grafting an estimated \$100 million of public funds. In light of such revelations, many grew increasingly skeptical of politicians and the extensive taxes and spending of Reconstruction era governments.

During the 1872 presidential election, in an ominous development for the Radical program, a group calling themselves Liberal Republicans abandoned Grant and joined forces with Democrats to nominate Horace Greeley on a platform of civil service reform, smaller government, and “home rule” or decreased federal interference in the South. Grant won reelection, but over the next several years, continued charges of corruption against the secretary of war, Grant’s own private secretary, and other officials further eroded Northern support for Reconstruction. In 1873, a financial panic plunged the economy into a severe economic depression. For many Northerners, the “Southern Question” receded in significance as Americans endured the worst contraction the U.S. economy had ever suffered for the next 5 years. During this period, White Southern Democrats became more openly violent against Black voters, leading many Blacks to avoid the polls. Although the Fifteenth Amendment and congressional measures provided a legal basis for the prosecution of such outrages, many Northerners despaired of reforming Southern society in light of the seeming lack of progress—and indeed deterioration—of race relations over the years of Reconstruction occupation. A series of U.S. Supreme Court rulings in 1873 and 1876 further undermined federal control over Reconstruction by restricting congressional regulation and federal enforcement of citizenship rights and returning these matters to the states’ jurisdiction. Northerners increasingly ignored the violent intimidation of Black Southerners, and between 1873 and 1876, Democrats regained control of Texas, Arkansas, Alabama, and Mississippi.

The End of Reconstruction

Events of the presidential election of 1876 led to the end of Reconstruction. The Democratic candidate, Samuel J. Tilden of New York, won the popular vote, but fraud and violence against Black voters led to disputed results in Florida, Louisiana, and South

Carolina—the last three Republican-controlled Southern states. Without these states, Tilden stalled one electoral vote short of the majority required for victory. In early 1877, Congress established an Electoral Commission to resolve the crisis. In a strictly partisan vote, the commission awarded the presidency to the Republican candidate, Rutherford B. Hayes of Ohio. Democrats were outraged, but Hayes and the Republican Congress assuaged them by offering increased federal support for Southern internal improvements and a return to “home rule” through federal noninterference and the removal of the last federal troops from the South.

By the end of 1877, Democrats “redeemed” the last Southern state governments. Union victory in the Civil War had decisively ended slavery and defeated the Confederacy’s bid for independence. However, ex-Confederates largely won the long Reconstruction struggle over the terms of reunion and the fate of Black Southerners. The scale of government and military intervention in the aftermath of the war was unprecedented, but the compromises of 1877 completed a retreat from Reconstruction and set the tone for the following decades of a relatively limited national government. The federal government would never again so forcefully assert Black civil or political rights until the Civil Rights Movement of the mid-20th century, when American leaders again deemed military presence necessary to support reform in Southern society.

RECREATION

Military commanders throughout history have known that soldiers' morale directly affects their performance on the battlefield. Until the 20th century, however, matters of morale focused on the immediate necessities of food, clothing, and equipment. Civilians who volunteered or sold necessary provisions supplemented the work of the Quartermaster Corps and, beginning in the late 1800s, Post Exchanges. The military did not provide organized recreation activities but left soldiers to devise their own entertainment. With time, the military broadened its focus on morale and began to consider organized recreation an essential part of maintaining soldiers' welfare. Recreation served the important functions of creating diversions from boredom and illicit behaviors, improving the quality of soldiers' daily experiences, and preserving a sense of normality and domestic relationships within the military and wartime environments. The particular form of recreation activities has varied with time and location and has evolved with the changing makeup of the military itself. This entry discusses the history of recreation programs and the types of activities available for service members in the U.S. military.

World War I Programs: Reminders of Home

World War I first prompted the military to devote considerable attention and resources to recreation activities for soldiers and sailors. On the eve of U.S. entry into the war, many Americans believed that

military camps posed serious moral and physical threats to young men. Removed from their familiar and familial environments and situated in a military culture that emphasized virility, many young men spent their off-duty hours in brothels and saloons. As large numbers of soldiers subsequently found themselves stricken with venereal disease and unable to perform their duties, military officials began to reconsider the advisability of these leisurely activities. Planning for war in Europe, they wanted to avoid a similar situation and determined that recreation programs would provide an essential diversion for soldiers stationed in training camps and overseas locations. Coupled with the efforts of Progressive Era social and religious reformers, the military provided formal recreation programs for soldiers both in the United States and throughout European battlefields.

Less than 2 weeks after entering the war, the secretary of war created the Commission on Training Camp Activities to meld the efforts of several existing associations: the Young Men's Christian Association (YMCA), the Young Women's Christian Association, the Knights of Columbus, the National Jewish Welfare Board, the American Library Association, the War Camp Community Service, and the Salvation Army. Formed with the primary goal of providing recreation to prevent soldiers from soliciting prostitutes, drinking alcohol, and gambling, the Commission on Training Camp Activities also sought to use the military to make good citizens of those who came out of their wartime experiences as healthy, moral, and educated men. Thus, the Commission on Training Camp Activities sought to repress illicit activities through the use of social hygiene education and the monitoring of camp communities, even as it provided wholesome alternative activities such as athletic and musical events, plays and films, dances and educational materials. The American Library Association complemented these activities by providing and supplying libraries within the training camps and later shipping books to soldiers at war.

Outside the training camp, the War Camp Community Service organized recreation for soldiers on leave in nearby communities, while the Young Women's Christian Association built Hostess Houses near camps where soldiers could spend time with their wives and families. The Red Cross provided similar services for soldiers in military camps and

along transit lines. Female volunteers also provided recreation services for patients in military hospitals and became known as “gray ladies” in a nod to their distinctive uniforms. The YMCA provided the majority of recreational facilities for the American Expeditionary Forces and operated the military’s Post Exchanges, ultimately erecting more than 4,000 huts and canteens across Europe. The YMCA also operated Leave Areas throughout Europe where soldiers could find comfortable lodging and entertainment in relaxing environments. The Knights of Columbus, the National Jewish Welfare Board, and the Salvation Army supplemented the YMCA huts with similar clubs of their own. Military and organization officials believed these recreation programs to be vital to the soldiers’ well-being, but they also believed that soldiers needed to be around the American women who served the food, fried the donuts, and danced with homesick men. Officials argued that women would remind men of their mothers and sisters, and it would inspire the men to wholesome behavior. Whether the women produced good behavior or not, the military relied on their services throughout the century.

World War II: The United Service Organizations and the Red Cross

The unprecedented military call-up of World War II demanded a more comprehensive and streamlined recreation program. What had previously been called the army’s Morale Division became known as the Special Services Division in 1942. Responsible for recreation, the Post Exchanges, and the Soldier Show, Special Services personnel were trained in the work of developing entertainment, athletics, and crafts for soldiers. These officers organized activities on bases and coordinated with the United Service Organizations (USO) to provide an extensive recreation program for soldiers stationed in the United States and around the world.

Formed in 1941, the USO concentrated the support of several civilian agencies into a single entity. Joining the efforts of the YMCA, the Young Women’s Christian Association, the National Catholic Community Services, the National Jewish Welfare Board, the Salvation Army, and the National Travelers Aid Association, the USO sponsored more than 3,000 clubs for soldiers and sailors within the United States. USO clubs offered free

coffee and doughnuts, a place to write home or see a movie, and—most popularly—a place to dance with young women. Thousands of women, all of whom had been screened by local committees, sought to demonstrate their commitment to the war effort and the military by volunteering their time in clubs. Although some USO clubs were racially integrated, most were racially segregated. Women in uniform also often found the clubs unsettling as most activities paired the female volunteers with male soldiers and designed few activities for military women. Additionally, USO Camp Shows, Inc. dispatched groups of performers to camps and clubs across the country to perform variety shows and plays. Soldiers and sailors in New York City could find entertainment at the famous Stage Door Canteen, a Broadway club run by the American Theater Wing, that offered dancing, entertainment, refreshments, and the frequent sight of a celebrity. The club became so popular that others opened in major U.S. cities, as well as in London and in Paris. The Red Cross provided recreation activities and entertainment for hospital patients as it had done in World War I.

Soldiers and sailors stationed throughout the various wartime theaters enjoyed recreation provided by the armed forces, the Red Cross, and the USO. The Army Special Services opened Service Clubs and operated Soldier Shows and Jeep Shows in which soldiers performed variety shows, plays, and musical acts in clubs and combat areas. The Red Cross organized nearly 2,000 clubs for military personnel around the world, while USO Camp Shows, Inc. brought world-famous celebrities such as Bob Hope, Marlene Dietrich, Laurel and Hardy, and Lucille Ball to entertain the troops. Red Cross Service Clubs, Fleet Clubs, and Aeroclubs could be found in all theaters, in large cities, remote villages, and even in “Donut Dugouts” near the front lines. All clubs provided athletic equipment, refreshments, and American women to talk with, while large facilities offered overnight accommodations. The Red Cross also ran rest homes for soldiers and sailors on leave. In 1942, in an effort to reach troops who could not travel to Service Clubs, the Red Cross began its Clubmobile program. Traveling on converted trucks and buses, women traveled across England and continental Europe to bring coffee, donuts, and newspapers to soldiers. Some Clubmobiles also had phonographs that provided music for impromptu dances.

The Korean and Vietnam Wars: Service Clubs and Touring Shows

Although the USO disbanded after World War II, the beginning of hostilities in Korea revived its efforts, and the organization again sent popular entertainers to put on shows for American troops. Likewise, the Red Cross revived its club program, renaming it the Supplemental Recreational Activities Overseas program, which was open to all UN personnel. The women who operated clubs also traveled in jeeps to take their refreshments and audience participation games to troops stationed far from the clubs. The military operated its own Service Clubs, staffed by civilian women.

During the Vietnam War, the military, the Red Cross, and the USO combined their services again to provide recreation for soldiers. Army Special Services opened 52 clubs that employed civilian women to coordinate recreation programs for all American military personnel in the country. Service Clubs featured stages for shows and performances, auditoriums, libraries, weight rooms, and sitting areas. Special Services personnel ran movies, scheduled game tournaments, and hosted themed and holiday parties. Additionally, personnel coordinated shows performed by local entertainers, USO troupes, and Command Military Touring Shows of talented soldiers selected for temporary duty to travel and perform for their fellow soldiers. The Red Cross resurrected the Supplemental Recreational Activities Overseas program and sent 627 "Donut Dollies" to operate 20 recreation centers on large military bases where soldiers could find free snacks, games, and conversation. To reach troops in the field, the women took their board games and refreshments on jeeps and helicopters to remote firebases and landing zones. Troops could also find a place to relax at several USO clubs across Vietnam and in Thailand, as well as in major U.S. airports. The USO continued its history of sending both famous and unknown entertainment groups to entertain soldiers. Bob Hope continued his tours and was joined by several Miss America pageant winners, National Football League players, and other entertainers, as well as many amateur groups.

Programs for Families and Deployed Troops in the Modern Era

The post-Vietnam War years witnessed many changes in recreation programs. As the all-volunteer

military integrated an unprecedented number of women into the forces, recreation programs that had relied on women to entertain a military of mostly single men prompted more criticism than they had in the past. Army Recreation Centers, for example, began to hire men to run programs that paid increasing attention to the needs of female personnel. Additionally, as a greater proportion of military personnel had families, the armed forces began to consider the morale of military families to be as important as the morale of individual soldiers and sailors. Each of the services' recreation programs currently provides athletic programs and entertainment for soldiers stationed in the United States and deployed around the world, in addition to services such as child care, Family Readiness Groups, and youth recreation programs.

Much of the military's stateside recreation is focused on family entertainment. Armed Forces Recreation Center Resorts at Walt Disney World in Hawaii, Germany, Korea, and Virginia Beach allow military families to find entertainment outside the base. Military personnel can also find discounted rates for travel and various events through Information, Tickets and Tours offices, as well as through several private companies. Sesame Street has even partnered with the military to provide its Talk, Listen, Connect program designed to help children who have a parent deployed. Additionally, the military continues to rely on its own personnel for entertainment. The Army's Soldier Show and the Air Force's Tops in Blue feature amateur soldiers in traveling musical variety shows, while the Army's USA EXPRESS is a touring band of soldiers that performs a variety of musical genres. Military personnel and families also enjoy the Army Concert Tour, which brings famous musicians to military installations around the country.

Personnel stationed in warzones continue to enjoy entertainment programs like their predecessors did, in addition to modern conveniences and services. While the accessibility of e-mail and Skype and the convenience of portable DVD players and iPods have somewhat lessened the demand for the audience participation games and sing-alongs of previous wars, the military and the USO continue to provide entertaining programs for soldiers and sailors. The USO provides more than 1,200 shows annually, although since the early 1980s, USO shows have featured only celebrity entertainers. In recent

years, the Dallas Cowboy Cheerleaders, the comedians Robin Williams and Stephen Colbert, and the country singer Toby Keith, among many others, have traveled to Afghanistan and Iraq. The USO also operates more than 100 centers on bases and in warzones throughout the Middle East, and it continues to staff welcome centers in major American airports for armed forces personnel in transit. The organization also provides care packages, holiday packages, prepaid international phone cards, and deployment support kits to deployed troops and their families. The USO in a Box, USO2GO, and Mobile Entertainment Gaming System programs reach troops without access to recreation centers by shipping the popular features of a USO club—laptops with Internet access, video games, and televisions—to soldiers at remote locations.

The military also devotes considerable energy to providing recreation options for its deployed troops. Soldiers stationed in Somalia, Saudi Arabia, Iraq, and other locations in the early 1990s could visit recreation areas and beaches managed by the armed forces during their time off duty. The Army and Air Force Exchange Service, the Navy Exchange, the Marine Corps Exchange, and the Coast Guard Exchange also service soldiers both at home and in deployment. These contemporary PXes (Post Exchanges) provide necessities and other merchandise, operate popular fast-food restaurants and movie theaters, and occasionally dispatch trucks to troops at remote outposts. All profits are in turn invested in recreation and morale programs.

RECRUITING ON COLLEGE CAMPUSES

There is considerable controversy about the presence of the Reserve Officers' Training Corps (ROTC) on college campuses. The periodic visits of military recruiters who seek to interest students in entering other officer commissioning programs after they graduate have also been controversial. These periodic visits are episodic and do not involve a permanent presence. In general, those opposed to them cite grounds identical to those used in opposition to the ROTC. This entry discusses the history of military recruitment on college campuses and looks at opposition to the presence of recruiters.

Opposition to military recruiting on campus has, in recent years, usually been framed in relationship to the recently repealed statutory ban on open and admitted homosexuals serving in the military. This was known colloquially as the Department of Defense's "Don't Ask, Don't Tell" (DADT) policy. People opposed to DADT argued that allowing a military presence on campus endorsed discrimination against gay men and lesbians, which they regarded as morally (and, from some perspectives, legally) unacceptable. In addition, numerous colleges and universities have had for some time policies that specifically bar any discrimination based on sexual orientation or preference. However, legislation enacted in early 2011 repealed the "gay ban," effective September 20, 2011, and, as will be noted below, several universities have already begun to reestablish ROTC units on their campuses. Opposition to ROTC on campus, though, is much broader, and of much longer standing, than that related to DADT. Even though its intensity and relevance to policy has varied greatly over time, such opposition has existed ever since ROTC was first formally established by Congress in legislation enacted in 1916 and 1920.

Although figures vary from year to year, over the past two decades the ROTC has been the source for the majority of newly commissioned U.S. Army officers and the single biggest source for new U.S.

Air Force officers. It is also a major source for the Marine Corps and the U.S. Navy (the latter two services rely much more on postcollege commissioning programs). In 2010, there were approximately 475 ROTC units of all three services (the Marine Corps does not have a separate ROTC program; Navy ROTC has a Marine option). There were roughly another 2,400 arrangements whereby other colleges and universities sent students to these units even though they did not have ROTC on their own campuses. (Many institutions host units from, or have arrangements with, more than one service, so these figures overlap immensely in terms of the number of institutions involved.)

Military training on American college campuses dates back to the Morrill Act of 1862, which authorized the establishment of land grant colleges and mandated that one of the subjects of instruction be “military tactics.” From 1862 through 1916, however, military instruction in colleges and universities was haphazard and spotty. The National Defense Acts of 1916 and 1920 established a basic framework for ROTC in both public and private institutions of higher learning, which remains today. Since then, two major structural modifications have occurred in the program. First, compulsory ROTC participation during the first 2 years of college (all involuntary ROTC service was in Army ROTC) was phased out at virtually all state institutions by the mid-1970s. Private institutions had never had ROTC attendance mandated by law. Second, scholarships for ROTC students, for which they incur a longer active-duty service obligation, were authorized by law for the navy in 1946 and for the army and the air force in 1964.

Organized opposition to a military presence on college campuses can be traced back to the 1920s and the aftermath of World War I, and it persisted throughout the interwar era. It was based on general pacifism, often but not always with religious motivations. In some cases, antiwar and antimilitary groups had a goal, which may or may not have been intermediate in nature, of eliminating only compulsory ROTC, without denying it to students who wanted it. World War II, its aftermath, and the early Cold War tended to dampen anti-ROTC pressures, but by the late 1950s, they were rising again, and reached a crescendo during the Vietnam War years. One result was that ROTC enrollment dropped dramatically from more than 300,000 in

1961 to about 60,000 in 1973, although much of the drop was due to the end of compulsory Army ROTC. Current (2010) enrollment remains at about 60,000.

In general, anti-ROTC views, since the late 1950s, have derived from two separate attitudinal tracks. First is the traditional one of opposition to military institutions and war, sometimes across the board, sometimes in relationship to current U.S. foreign and defense policy. Second is a belief among university faculty and staff that ROTC courses and activities are not academically rigorous enough to warrant inclusion in the curriculum, and that ROTC officer instructors do not have the requisite academic credentials to be granted any or all faculty privileges. Another source of opposition, melding these two, is that the military, being an allegedly authoritarian institution not devoted to free scholarly inquiry, is incompatible with the academy.

The specific DADT-based opposition to ROTC was a comparatively recent development, based on the broader national movement to accord full social and legal legitimacy to openly gay people. Some have suggested that ending DADT will greatly reduce anti-ROTC sentiment on college and university campuses. Faculty and administrators at some institutions that ended ROTC during the Vietnam War era have stated their willingness to reinstate it if DADT is repealed. More specifically, Harvard, Columbia, Yale, and Stanford Universities have reinstated ROTC programs (although Brown University has decided to continue its ROTC ban, apparently because transgender people are not allowed into the armed forces).

On the other hand, it has been argued that at least some anti-ROTC sentiment for the stated reason of opposition to DADT has been, in fact, a “smoke-screen.” Even if DADT is repealed, they assert, the generally antimilitary orientation of many college faculty and staff would frustrate attempts to bring it back, or continue to generate pressure to remove it where it already exists. It should also be noted that several public laws enacted since the mid-1990s require that colleges and universities that receive any federal funds provide the same access to military recruiting personnel, including ROTC, that is available to other prospective employers. There are strong indications that *student* anti-ROTC views are minimal, and that opposition to a military presence on campuses is very much a generational attitude

found primarily among older faculty who came of age during the Vietnam War era.

RECRUITMENT, ENLISTED

Enlisted recruitment involves attracting interest from qualified recruits and converting that interest into enlistment contracts and then actual accessions to the various military services at Military Entrance Processing Stations. The primary age demographic for enlisted recruitment is 18 to 24 years. The primary measure of enlisted recruitment quality is the Armed Forces Qualification Test. This entry outlines the various strategies utilized in enlisted recruitment, highlights the increasingly important role of advertising to enlisted recruitment, discusses the growing importance of women and minorities to enlisted

recruitment, and details the changes that have occurred to enlisted recruitment since the advent of the all-volunteer force (AVF).

Strategies

Military policymakers have multiple strategies available to them to accomplish enlisted recruitment. The main strategies for enlisted recruitment are utilizing recruiters, purchasing advertising, offering enlistment bonuses, and providing supplemental college benefits beyond those already provided by the Department of Defense. Of these strategies, the most effort and the largest expenditure involves utilizing recruiters.

The role of the recruiter in the recruitment process is especially important. The recruiter serves as the personification of military service. More specifically, the recruiter fulfills multiple functions that include advertiser, public relations specialist, guidance counselor, human resources expert, and mentor. The recruiter’s primary task is threefold. First, the recruiter must convert individuals with no particular commitment to the military, known as *leads*, into individuals agreeing to an appointment with the recruiter, known as *prospects*. This process of contacting leads is termed *prospecting* and is conducted either face-to-face or remotely through the use of telephone, texting, e-mail, or social media websites such as Facebook or Twitter. Second, the recruiter must convert prospects into applicants by securing an agreement to process for enlistment. This process is termed *interviewing* and involves discussing personal goals, offering career plans, and asking the prospect to enlist. Third, the recruiter must process the paperwork required for enlistment, ensure the eligibility of the applicant, and follow up to confirm completion of the enlisted recruitment process. In addition to these short-term tasks, the recruiter also pursues long-term missions. One example includes networking with community leaders at schools, businesses, religious institutions, and civic organizations to promote community awareness of the benefits of military service. Recruiters are structured around the recruiting center. Recruiting centers are arranged geographically across the country in local communities both large and small. Each military service has a recruiting command that executes the recruiting mission nationally. Recruiting battalions and companies execute the recruiting mission regionally. Recruiting

centers and the recruiters themselves execute the recruiting mission locally.

Following the role of the recruiter in the recruitment process, the next two largest areas of effort are (1) the purchase of advertising and (2) the offer of enlistment bonuses, which fluctuate in relative importance depending on circumstances. Recently, the relative importance of the purchase of advertising and of the offer of enlistment bonuses has been approximately equal. The least utilized enlisted recruitment strategy is the provision of supplemental college benefits. Individual military services use College Fund programs for supplemental education benefits. It is important to note that the Department of Defense offers separate college benefits such as the Montgomery G.I. Bill and the Post-9/11 G.I. Bill that are larger and more comprehensive than supplemental college benefits offered by the individual services.

All of the above enlisted recruitment strategies have limitations. For instance, increasing the number of recruiters requires a large increase in infrastructure and overhead because recruiters have a limited geographic area of operations. Purchasing advertising is increasingly expensive if an audience is to be targeted and calibrated effectively. Offering enlistment bonuses is costly because the government is required to pay the same enlistment bonus to every enlistee, not just to the enlistees who were convinced to join the military specifically because of the enlistment bonus. Other enlisted recruitment strategies have not been consistently pursued for various reasons. For example, increasing enlisted pay results in an increase in enlisted recruitment. However, it is costly because the government then is required to keep paying the resulting higher personnel costs every month, even after its recruiting goals have been adequately met. It is important to note that the use of enlistment bonuses has increased most of the enlisted recruitment strategies mentioned above, some fourfold over the past decade.

Advertising

The importance of advertising for enlisted recruitment has increased dramatically over the past decade. Recruiting advertising has both short- and long-term goals. The short-term goal of recruiting advertising is to produce enlistments. The long-term goal of recruiting advertising is to create brand

recognition for each military service in general or a particular branch of the military specifically. Expenditures on recruiting advertising have more than doubled in the past decade to more than \$600 million for all military services combined.

Over the past 50 years, mass media has changed dramatically. Youth spend a significantly larger proportion of their time watching cable television, exploring the Internet, and playing video games. These increases contrast with large decreases in the amount of time youth spend reading print literature, such as magazines and newspapers, and watching broadcast television. Marketing firms in general and military policymakers in charge of enlisted recruitment specifically understand these trends. Even though television continues to have the largest proportion of advertising, the specific categories on which advertisers focus most have shifted over time. For instance, advertising expenditures in broadcast television, magazines, and newspapers have all fallen significantly. Advertising expenditures in cable television and the Internet have risen in relatively inverse proportion.

As the various forms of media have proliferated and become more diffuse, targeting a particular audience has become more complex. For instance, successful advertisements must first reach a particular threshold level before they will capture the attention of the intended audience. However, advertisers must be careful, as saturation can be reached quickly. Saturation occurs when additional advertisements have no added value on the intended audience. Ideal advertising efficiency rests between the two extremes of threshold and saturation. Furthermore, venues such as cable television programming and Internet sites have become more specialized. Marketing efforts can potentially target a particular audience more directly and effectively today than in the past. However, the costs of doing so have increased significantly, and technological developments that provide consumers with more control over media have also made marketing more difficult. For instance, consumers with a digital video recorder have the ability to skip commercials completely if they so choose. Marketing has attempted to target these specialized audiences by focusing increasingly on Internet and cable television. This trend began in the mid-1990s and has extended more recently to sponsoring events such as the National Association for Stock Car Auto Racing (NASCAR), football games, and

mixed martial arts. This trend holds true for both the broader advertising market and the more specific enlisted recruitment advertising market.

Due to the diffusion of media, the costs of reaching an audience have increased dramatically. However, the general consensus is that purchasing advertising is still a cost-effective strategy for enlisted recruitment. All military services pursue it, albeit with different focuses among the various services. For instance, the army and the Marine Corps tend to focus on television advertising, while the air force and navy tend to focus on radio and magazine advertising. It is important to note that the approach of each service to advertising is interconnected with that of the other services. Interservice competition exists in which successful advertising for one service can directly hamper the advertising efforts of another service.

Women and Minorities

Women and minorities have played an integral role in the U.S. military throughout its history. However, both groups have faced tremendous obstacles to equal participation. The U.S. Navy was the first service to utilize women significantly, recruiting women in World War I. Most of these women served in the navy as clerical workers and nurses during the war, but they did remain after conflict ended. Moreover, Congress under the Naval Reserve Act of 1925 banned women from remaining in the naval services, except as nurses. Once again in World War II, women served in the armed forces, this time in larger numbers—280,000 according to some estimates. Even with these early starts, women consistently represented only a fraction of the total U.S. military, usually less than 2% prior to the introduction of the AVF. Since the advent of the AVF, and especially following Operation Desert Storm in 1990–1991, the percentage of women participating in the armed forces has grown dramatically, now representing almost 15% of the total force.

Minorities also participated in the U.S. armed forces throughout history, but they faced significant obstacles. President Harry S. Truman ordered the integration of the armed forces with Executive Order 9981 on July 26, 1948. Significant change proceeded slowly until real integration was achieved by the mid-1950s. When the draft came under increasing scrutiny in the late 1960s, some supporters of

the draft argued that an all-volunteer military would increasingly place the burden of military service on minority groups. As a result, the end of the draft and the start of the AVF made diversity a focal point of enlisted recruitment.

In 1974, Congress mandated the Department of Defense to report statistics detailing on an annual basis the diversity of the military. Multiple programs were established to promote diversity within the enlisted recruitment process. Most recently, the 2009 National Defense Authorization Act mandated the creation of the Military Leadership Diversity Commission. After 18 months of investigation and research, the commission released its report on March 7, 2011. The commission reported that the U.S. armed forces currently evidence low representation of minorities and women in senior military leadership positions. The commission recommended targeting enlisted recruitment specifically toward the goal of increasing representation from women and minorities to avoid the appearance of a lack of opportunity for women and minorities.

Changes

Enlisted recruitment has changed over time. The draft ended in 1973. It was replaced with the AVF. As a result, enlisted recruitment became directly linked to improving and marketing the benefits of enlisted service. These benefits included increased enlisted pay, medical and dental care, paid leave, job skills training, and increased college benefits. Enlisted recruitment also focused on touting other indirect benefits of enlisted service, such as job stability, job security, and advancement opportunity. It is important to note that in addition to direct benefits, the hierarchical organization of the military has helped enlisted recruitment. Many youth enlisted due to the fact that military promotion is based strictly on seniority and merit. Since no lateral promotions occur from outside organizations, as is common in other industries, recruits can be certain that they will be given a fair shot at promotion if they put in the requisite work. Providing, improving, and marketing the benefits drove enlisted recruitment from 1973 until 2001. With the terrorist attacks on America on September 11, 2001, there was an accompanying surge in American patriotism. The concept of defending America from attack led

to many enlistments. High-profile cases, such as National Football League star Pat Tillman forgoing a significant athletic contract to enlist in the army, made national news.

Even though the primary motivation for enlisting had shifted from benefits, the modest rise in enlisted recruitment initially after 9/11 was followed by a slow and steady decline. By 2005, enlisted recruitment was far below its goals. Most notably, in that year alone the army missed its quota by almost 7,000 recruits. With enlisted recruitment numbers declining, quality also declined as the result of increased reliance on enlistment waivers. Enlistment waivers provide exceptions to general standards of enlisted recruitment, and reliance on them generally signals lower standards.

Since 2005, there has been a notable shift in enlisted recruitment back to a focus on increased benefits. When these increased benefits combined with a widespread recession and record unemployment, the number of enlisted recruits increased dramatically. The increase in applications has also affected quality. With larger numbers of applications to choose from, enlisted recruiters needed to rely less on enlistment waivers for areas of disqualification such as Armed Forces Qualification Test scores, age, or prior criminal activity. The result is that the current quality of enlisted recruits has hit historic highs. Significantly, the current enlisted recruit tends to be younger, smarter, and more educated than enlisted recruits in the past and the American population as a whole. Overall, more than 3 million enlisted recruits have joined the military since 9/11. It is important to note that even with these large numbers of enlisted recruits, still less than 1% of the nation's population has deployed to Afghanistan and Iraq over the past decade. The result is a higher quality enlisted force that is increasingly a smaller percentage of the nation's overall population.

RECRUITMENT, OFFICER

Officer recruitment involves identifying qualified officer candidates, providing them with information about military service, convincing them of the rationales for becoming an officer, processing them through one of the available officer programs, and then commissioning them as officers. This entry includes a brief history of contemporary officer recruitment, discusses the role of advertising in officer recruitment, details the various officer programs, and highlights the growing importance of women and minorities to officer recruitment.

There are significant differences between officer recruitment and enlisted recruitment. The numerical requirements of enlisted recruitment are much larger than those of officer recruitment. However, officer recruitment demands higher standards due to increased responsibility. While enlisted recruitment focuses primarily on the tangible benefits of military service, officer recruitment focuses more heavily on the increased responsibility, leadership opportunities,

and character development associated with being an officer. Although increased responsibilities are compensated with higher pay, these intangible skill sets are the benefits most often highlighted during officer recruitment. There are also similarities between officer recruitment and enlisted recruitment. For instance, the role and importance of advertising to both is similar.

History

In 1969, the Gates Commission began studying the implications of ending the draft. Converting from the draft to volunteer military service fundamentally altered officer recruitment. Military policymakers had to develop the means to communicate effectively the benefits of voluntarily becoming an officer. Some critics at the time argued that it would either not be possible to maintain the appropriate numbers of officers required for national security or that the standards for becoming an officer would have to be lowered in return for achieving a sufficient number of officers. When the draft ended in 1973, the all-volunteer force (AVF) replaced it. Officer recruitment within the AVF involved pay raises aimed at making officer service more competitive with the prevailing civilian labor market for a college graduate. As a result, officer recruitment, measured both in numerical strength and in overall quality, became critical to ensuring the success of the AVF. The increased importance of officer recruitment also elevated advertising, market research, marketing, and public relations as necessary tools for successfully conducting officer recruitment.

The terrorist attacks on America on September 11, 2001, affected officer recruitment in a direct fashion. The ensuing U.S. military campaigns, first in Afghanistan and then in Iraq, demonstrated a higher likelihood of an increased number of deployments as well as longer individual deployments for officers. There was also a notable shift in the utilization of National Guard and Reserve units from exclusively homeland defense to repeated deployment worldwide, oftentimes in combat situations. All these factors presented unique obstacles to conducting officer recruitment successfully in the post-9/11 era. Beginning in 2008, the U.S. economic downturn offset some of these obstacles. A widespread recession and high levels of unemployment contributed to a more favorable officer-recruiting environment.

Many college graduates found the job stability, secure employment, and leadership opportunities of becoming a military officer an attractive option.

Advertising

One area where there is little distinction between officer recruitment and enlisted recruitment is advertising. In general, the role and importance of advertising to both is similar. The main distinction between the two regarding advertising is that the message differs. In enlisted recruitment, the message of advertising focuses on the tangible benefits of enlisted service, especially job skills, education benefits, and enlistment bonuses. In the case of officer recruitment, the message focuses on the leadership opportunities associated with becoming an officer and the usefulness of these skills in both the military and civilian sectors. However, this distinction is not always vivid. For example, the Marine Corps advertising message of “The Few. The Proud.” is utilized for both officer and enlisted recruitment, usually with only a slight variation in the visual packaging.

Advertising has become increasingly important to officer recruitment. On August 3, 2009, the U.S. Army launched the first officer-specific recruiting campaign. The army labeled this effort the Officership Campaign. The advertising effort of the campaign focused on accomplishing two objectives. First, the campaign sought to define for officer candidates exactly what it means to be an officer. The advertising effort characterized officers as leaders, mentors, problem solvers, and decision makers. A significant part of the campaign attempted to illustrate officer leadership with actual contemporary officers as examples. Second, the campaign sought to educate officer candidates on the multiple programs available to become an officer. The fundamental message was that there is a vast array of options from which officer candidates can choose, depending on their particular circumstances.

Officer Programs

There are four main officer programs. The largest officer program is the Reserve Officers’ Training Corps, also known as ROTC. This program annually produces approximately 45% of all officer commissions. ROTC has a long and storied history dating back to the early 20th century. It began with the National Defense Act of 1916. It has grown to

become a federal entity that offers multiple options for officer candidates. ROTC offers 2-, 3-, and 4-year programs as well as various scholarships that provide full funding for tuition, books, fees, and living expenses. ROTC combines a rigorous civilian education at institutions across the country with standardized military training both during the academic year and during the summer. ROTC units exist at more than 300 universities and colleges across the nation, with commissioning options in all five of the military services. Officer candidates successfully completing the ROTC program receive a college degree and an officer commission.

The second largest officer program involves the four federal service academies. These programs annually produce approximately 25% of all officer commissions. The four federal service academies are the U.S. Military Academy, the U.S. Naval Academy, the U.S. Coast Guard Academy, and the U.S. Air Force Academy. The U.S. Military Academy is located at West Point, New York. West Point was founded on March 16, 1802, commissions officers into the U.S. Army, and is the oldest service academy. The U.S. Naval Academy, located at Annapolis, Maryland, was founded on October 10, 1845, and commissions officers into both the U.S. Navy and the U.S. Marine Corps. The U.S. Coast Guard Academy, presently located at New London, Connecticut, was originally founded in 1876 aboard the schooner *Dobbin*, and it commissions officers into the U.S. Coast Guard. The U.S. Air Force Academy, located at Colorado Springs, Colorado, was founded on April 1, 1954, and commissions officers into the U.S. Air Force. At these four institutions, officer candidates earn an undergraduate degree within a comprehensive military environment. Officer candidates, referred to as either cadets or midshipmen, depending on the service, earn a bachelor of science degree in various fields and receive full room, board, tuition, medical, dental, and a modest monthly allowance. Admission to all four federal service academies is highly competitive and requires strong test scores, usually on the Scholastic Aptitude Test. The four federal service academies also require that officer candidates be young and unmarried. Three of the four federal service academies, the U.S. Coast Guard Academy being the one exception, have approximately 4,000 students with 1,000 officers commissioned annually and require a congressional nomination for admittance. The U.S. Coast Guard

Academy does not require a congressional nomination and is the smallest federal service academy, with approximately 1,000 total cadets. The four federal service academies combine an excellent tuition-free education with rigorous military training resulting in a college degree and an officer commission.

The third largest officer program is Officer Candidate School. It is important to note that the U.S. Air Force calls their program Officer Training School, or OTS. This program annually produces approximately 20% of all officer commissions. The officer candidates in this program are already college graduates but have no prior military training. Officer candidates in this program usually are older than typical officer candidates in ROTC and the four federal service academies. Both Officer Candidate School and Officer Training School are short-term programs, varying in length up to 20 weeks of intensive military training. Officer candidates receive an officer commission on completing the program.

The fourth and smallest officer program is the direct commission program. This program annually produces approximately 10% of all officer commissions. Officer candidates in the direct commission program are already college graduates and are trained specialists in a particular field. Examples of specialized fields include legal, medical, ministerial, and engineering. Officer candidates in the direct commission program receive an officer commission in the Judge Advocate General's Corps, the Medical Department, the Chaplain Corps, or the Corps of Engineers in one of the military services.

Women and Minorities

Since the creation of the AVF in 1973, officer recruitment of women and minorities has received increased attention. Some supporters of the draft argued that an all-volunteer military would increasingly place the burden of military service on minority groups. As a result, military policymakers began paying particular attention to tracking, analyzing, and promoting diversity within the military. Diversity became increasingly important for officer recruitment for two reasons. First, diversity became critical to ensure that military service within the all-volunteer system was egalitarian and representative. Second, diversity became critical to ensure that the military officer corps was representative of both the larger military enlisted population and

the American population as a whole. Achieving diversity along these two lines became increasingly important for officer recruitment. Successfully doing so would illustrate that there was significant opportunity for promotion within the U.S. military for all officer candidates, including women and minorities. In turn, success in this area would help strengthen future officer recruitment among women and minorities.

Military policymakers have made significant efforts to ensure that officer recruitment maintains diversity. On October 7, 1975, President Gerald R. Ford signed legislation allowing women to enter the four federal service academies. The first group of women graduated from the academies and received their commissions in 1980. Similar efforts occurred rapidly throughout the other officer programs. In fact, the number of women and minority officers has more than doubled since the advent of the AVE.

More recently, the 2009 National Defense Authorization Act established the Military Leadership Diversity Commission. Congress tasked the commission to evaluate the diversity of the U.S. military, specifically focusing on diversity within military leadership. After 18 months of intensive study, the commission released its report on March 7, 2011. The commission reported that even with significant progress on diversity in the military overall, there is less diversity in officer ranks, especially among the most senior officers known as general and flag officers. The commission's recommendations included ensuring that officer recruitment continues to focus on communicating to women and minorities the benefits and opportunities associated with becoming an officer.

RED CROSS, INTERNATIONAL COMMITTEE OF

The International Committee of the Red Cross (ICRC) is an international humanitarian agency located in Geneva, Switzerland. The ICRC has been awarded the Nobel Peace Prize three times, in 1917, 1944, and 1963. Its current president is Peter Maurer, and it is governed by four bodies—an Assembly, an Assembly Council, a six-member Directorate (headed by Yves Daccord, who serves as Director General), and the presidency. The ICRC is part of the International Red Cross and Red Crescent Movement, which itself contains the International Federation of the individual national branches of those organizations. While specific national organizations tend to deal with disaster relief efforts in their home countries, the ICRC is involved internationally in civilian and prisoner-of-war (POW) relief during times of war or unrest, and it aims to act as a neutral observer to ensure that all sides of a conflict maintain international standards of conduct. This entry discusses the humanitarian work and history of the ICRC and looks at current issues.

Background

In 1859, Henri Dunant, a Swiss Calvinist businessman and aid worker, witnessed more than 40,000 sick and wounded soldiers abandoned and lacking proper attention after a battle in Solferino, Italy, between the Austro-Hungarian Empire and the Franco-Sardinian alliance in the Second Italian War for Independence. Dunant self-published the book *A Memory of Solferino* in his native Switzerland in 1862; and the following year, Dunant and five other Swiss men created the International Committee for Relief to the Wounded. The first conference in 1863 selected the Red Cross as an international designation for battlefield aid workers. The formation of the organization came at a crucial time for humanitarian work—in 1864, the signing of the First Geneva Convention created some of the first legal protections for the sick and wounded in battle.

The First Geneva Convention was followed by a second in 1906 and a third in 1929, as well as the two Hague conventions in 1899 and 1907. The Geneva Convention of 1949 serves as the most current basis for the work of the organization under international law. Throughout the development of the current body of international humanitarian law, national Red Cross Societies began to develop in countries around the world, with the Red Crescent symbol used in the Ottoman Empire. Henri Dunant, by the turn of the 20th century living an impoverished life in rural Switzerland, received the first Nobel Peace Prize in 1901.

Clara Barton founded the American Red Cross in 1881 and played an instrumental role in securing U.S. ratification of the Geneva Convention of 1864. The American Red Cross is a constituent member of the International Federation of Red Cross and Red Crescent Societies. Although much of the American Red Cross's humanitarian work focuses on aiding the victims of natural disasters within the United States, this organization plays a crucial role in serving the needs of American servicemen and servicewomen, especially those held as POWs. During World War II, Red Cross packages sent to American POWs provided food and other supplies that proved vital to their survival.

History in the 20th Century

World War I would be the first major test of the Red Cross's humanitarian capabilities, bring-

ing unprecedented casualties and destruction to the European continent. The Red Cross operated a Prisoners of War Agency to maintain information on POWs for their families and established the precedent of Swiss delegates visiting and inspecting POW camps. The horrors caused by chemical weapons used during the First World War encouraged the group to lobby successfully for the permanent banning of all chemical weapons in 1925. The ICRC was also instrumental in the establishment of the Third Geneva Convention in 1929, which granted POWs humanitarian rights in international law. These new laws, particularly with regard to POWs, would enable the Red Cross to perform a great deal of relief work in the Second World War. The post-World War I era also saw a huge proliferation of national Red Cross movements throughout the world.

When World War II broke out, the ICRC again went into action. Despite the ICRC's successful work to alleviate and monitor the conditions of POWs in Nazi-occupied Europe, the organization's wartime aid to civilians was not as effective. While the Red Cross had assisted civilians as best as they could during World War I, two decades later there was still no international legal obligation to civilians affected by war. While the Red Cross lobbied to gain regular access to concentration camps, the German government consistently denied the request. The Swiss government, fearing retaliation from the Nazis, prevented the ICRC from publicly denouncing Nazi atrocities against civilians. Most important, the ICRC failed to make public reliable information on the Holocaust that was received in 1942, leading to major international criticism after the war and a definitive separation from the Swiss government from the governance of the ICRC.

After World War II, one of the major changes to be implemented in the 1949 update of the Geneva Conventions was the protection afforded to civilians. According to the new protocols, civilians would be granted the same international protections during wartime that were traditionally given to combatants and POWs. The ICRC was also given the responsibility of the International Tracing Service in the postwar era, which sought to reunite family members displaced by the war and persecution. The International Tracing Service still operates from an archival facility open to researchers in Germany and maintains records on displaced persons, forced laborers, and concentration camp inmates.

The ICRC's politically neutral stance would continue to serve both as a basis for its legitimacy and as a point of contention in disagreements with particular states. After some contention, the Red Cross successfully lobbied Washington to abide by the Geneva Conventions in Vietnam in the 1960s, and when the United States refused to grant Geneva protection to civilian prisoners several years later, the public disapproval was strong and widespread.

While not all governments would cooperate with the ICRC (notably demonstrated when the Nigerian government shot down a Red Cross plane in 1969 during that country's civil war), it was and remains generally politically wise for governments to cooperate with the Red Cross. During the Cold War era, however, many socialist and Third World governments refused the Red Cross presence, notably North Korea and North Vietnam.

Current Issues

The International Committee of the Red Cross struggles to maintain neutrality in humanitarian efforts in today's global climate, and even after the Cold War, the issue of the Red Cross as a symbol of Western ideals or individuals has been a stumbling block in some nations. One of the bigger challenges facing the ICRC today is the question of how to operate in the Islamic world. Because the ICRC's symbol is a cross, the question of ICRC neutrality is at the forefront of that discussion, given the current widespread Red Cross presence in Islamic countries. The ICRC has gone so far as to hold conferences in major Middle Eastern cities to campaign for the compatibility of international humanitarian law with traditional Islamic Sharia law. Aiding these efforts is the strong presence of Red Crescent societies throughout the Islamic world. First used in 1878 by the Ottoman Empire, there are now Red Crescent societies in every Islamic country. The condition for independent statehood to become a member of the International Federation of Red Cross and Red Crescent Societies was only lifted once, for Palestine in 2007.

Despite these issues, the ICRC currently maintains a strong global presence with more than 11,000 employees worldwide, and its neutral humanitarian aid has allowed the organization to work in situations such as the Israel-Palestine

conflict and in regions affected by the Global War on Terrorism. It is engaged in operations aiding refugees and civilians, promoting public health and clean water initiatives, and aiding economic development and security throughout the world. According to the ICRC, its 10 largest operations are in Pakistan, Afghanistan, Iraq, Somalia, the Sudan, the Democratic Republic of the Congo, Israel and the Occupied Territories, Colombia, Yemen, and Mali.

Conclusion

The ICRC maintains a strong presence in more than 80 countries, and it is a major current and historical source for not just humanitarian aid but also the codification and promulgation of international humanitarian law. The extent of the ICRC's aid programs worldwide proves the human value of an organization whose founding was dedicated to alleviating human suffering. The relationship of the ICRC to individual states in years to come will be determined by the ability of the Red Cross to maintain its neutrality as well as the willingness of individual states to cooperate with international law and humanitarian concern.

REGIMENT

The term *regiment* was derived from 16th-century French and was utilized to describe a designated number of companies that varied in different armies and over time. A colonel usually commanded the unit. While historically regiments represented primary units of tactical and administrative organization consisting of three battalions and a regimental headquarters company, since the 1950s the status of regiments has been in flux, particularly in the U.S. military. This entry discusses the history of the regiment and the makeup of regiments in the U.S. Army.

The initial institution of the regiment developed at a time when the military institutions of Europe were changing from the medieval feudal model to the more modern bureaucratic model of military organization. By the 18th century, the term applied to a unit consisting of roughly 10 companies of infantry. Since the size of companies could vary between 80 and 100 men, a regiment was anywhere between 800 and 1,000 plus additional officers. Identification of regiments during the period is also difficult due to the fact that the terms *battalion* and *regiment* were often used interchangeably to describe European and North American military organizations. They were often identified by the region where they were recruited or by the name of their colonel as they were often considered his property. All of the preceding descriptors applied to the regiments that composed American armies from the American Revolution through the Mexican-American War.

American Civil War

In the U.S. Civil War, both the Union and the Confederacy raised numerous regiments that included roughly 1,000 men when they took the field. Combat casualties and sickness could quickly attrite these numbers down to as low as 400. In this conflict, the regiment was the essential tactical unit. At the time, the U.S. Army relied on a concept known as the expandable army, under which state units would be recruited to rapidly enlarge a very small peacetime force. In the North, this practice led to competing systems of the U.S. Army, USA, and U.S. Volunteers, USV. Both of these organizations supplied regiments to the Union Army. In the Confederacy, various states raised their own regiments, which were then

sent to join the larger field armies. On both sides, units were often designated by the state from whence they were recruited and a number. This practice, along with the expandable army concept, remained in place through the First World War.

World War I

Toward the end of the First World War, the Rainbow Division—so called because it drew from numerous states—was created as a means of creating a more unified national military force. Still, many regimental organizations remained intact. Likewise, the National Defense Act of 1920 greatly modernized the overall army organization. Still, the regiment remained a significant component, even though it was superseded by the division as the main tactical unit.

World War II

During World War II, U.S. infantry regiments were composed of three battalions each. The respective battalions were themselves made up of four companies. Three regiments, in turn, created a division, which contained 15,000 men. During this conflict, regiments were then designated solely by numbers.

Cold War and Beyond

In the aftermath of World War II, and paralleling the emergence of the Cold War, the U.S. Army arrived at an increasing awareness of the need to develop a more modern organizational framework. This need drove the developments of the Combat Arms Regimental System, which served as the means of assigning designations to units of the five combat arms between 1957 and 1981. These branches included Infantry, Field Artillery, Armor, Cavalry, and Air Defense Artillery. The U.S. Army Regiment and accompanying regimental system (also known as USARS) were established in 1981 to replace the Combat Arms Regimental System that existed throughout the Cold War.

The purpose behind the institution of the U.S. Army Regimental System was to provide each soldier with the opportunity for continuous identification with a single regiment. The regiment they would identify with was the one in which they would likely serve recurring assignments over the period of their enlistment. This was designed to boost unit

identification and belonging on the part of enlisted soldiers and to enhance the overall esprit de corps of the unit through the inculcation of their respective culture and traditions. As noted, this replaced the Combat Arms Regimental System, which was in use between 1957 and 1981.

Since its implementation in 1981, all active-duty soldiers have been required to affiliate with a specific regiment; regimental affiliation is based on the unit associated with soldiers' specialty. The affiliation begins on their arrival at their first assignment for both officers and enlisted personnel. The only exception is if the soldier should voluntarily select another regiment. Combat soldiers and enlisted personnel whose initial assignment is not to a regimental body may defer their selection until they are provided with such an assignment.

The combat arms included in the regimental system are the Air Defense Artillery, Armor, Aviation, Cavalry, Field Artillery, and Special Forces regiments. Inclusive of all the various subgroups under these general distinctions, the Army Regiment System boasted some 181 regiments of various sizes determined primarily by their specific missions within the context of the overall military organization.

Currently, the U.S. Army Regimental System is in the midst of a massive reform effort that will be completed in 2013. The purpose of these reforms is to create a more flexible and fluid organization capable of rapid and robust responses to the variety of military threats confronting the United States in the world at the present time.

A major component of the current reforms is the switch of basic maneuver units from divisions to brigades. When the reforms are complete, they will yield an increase in the number of combat brigades in the Regular Army from 33 to 48, with similar increases in National Guard and Reserve forces. Divisions will retain their various lineages, but headquarters' staff will be more interchangeable and able to command any brigade, not just those that carry their divisional lineage. How these changes will affect the regimental structure and lineage remains unclear at the current time.

Conclusion

Since the creation of the Continental Army, the regiment has served as a significant organizational component of the nation's fighting force. The U.S. Army

Regimental System provided the army with a great deal of flexibility in the period following the conclusion of the Cold War. Clearly, the new reforms currently under way underscore the necessity of further changes to respond to the current threat environment.

RELIGION AND WAR

Attention to the relationship between religion and war has increased considerably since the end of the Cold War and the attacks on September 11, 2001. The precise nature of the relationship continues to be debated, yet in each case, they cannot be properly understood without reference to their object. Both religion and war are means to different ends, spiritual and political. The examples of the Crusades and the Jihad are frequently cited as self-evident examples that religious belief fosters adversarial attitudes leading invariably to violent conflict.

Before proceeding with an examination of the role of religion as a cause or cure for violence, it is necessary to establish that religion, as such, should not be understood as an unchanging or transhistorical phenomenon. To argue that religion causes war first assumes that religion can be understood as a stable feature throughout time, even when abstracted from its expressions in different creeds and societies. Such a view privileges a psychological understanding of religious belief that is unhelpfully narrow and fails to provide a credible explanation for the immediate causes of war, variants in religious doctrine, or

a faith's ability to hold sway over those engaging in war. As scripture scholars have noted, communities play active roles in sustaining and interpreting the meaning of sacred texts and beliefs for succeeding generations. This proviso calls into question the existence of an inherent inclination toward violence in religious belief, while acknowledging that religion has often been used to further the political goals of war by providing the veneer of moral loftiness. Instead, the connection between religious belief and the conduct of war is more often expressed in the development of laws governing war, and regrettably, by its occasional appropriation for purely propagandistic reasons. This entry examines this tangential relationship by looking at how different religions defined their theological positions on war, and how these developments have affected diplomacy and modern warfare.

War, What Is It Good For?

Carl von Clausewitz, one of the most influential war theorists, defined war as an extension of international politics. Clausewitz insisted that the political object is the primary concern of the overall military strategy, determining the appropriate force, targets, and point of resolution. Ordinarily, nations go to war when political purposes cannot be effectively achieved otherwise, and the war ends with a treaty that redefines the political relationship between those nations that is proportionate to the military advantage of one side over the other. When religious purposes adulterate the immediate political ends of war, the military objectives become less clear. If war derives its form from the policies it seeks to promote, and if religious objectives narrow the range of acceptable compromise, then the introduction of religious motivations would significantly impair the possibilities for peace and prolong conflict. Since religious goals are understood in spiritual, eternal, and often imperceptible terms, their intrusion into debates on war policy often leads to unforeseen consequences, such as neglect of the customary laws of war and difficulties limiting the proportionate use of force in war. Once the political center is lost, Clausewitz insisted, there is nothing to prevent conflicts from escalating into wars of annihilation. For these reasons, wars that employ religious propaganda tend to be more destructive and difficult to resolve.

Violence in Monotheistic Religions

Religion is purported to lead to conflict when the logic of an exclusive truth claim, held collectively by a religious community, encounters its contradiction in the doctrines of a rival community. The God of Moses proclaimed, "Do not follow other gods, the gods of the peoples around you; for the Lord your God, who is among you, is a jealous God" (Deuteronomy 6:14–15). The exclusive truth claims made by monotheistic religions seem to suggest that believers in a single God would be more inclined to make war than those belonging to nonmonotheistic religions. The argument is not uncommon. The historical examples of the destruction of Jericho by the Israelites and the early expansion of Islam and the Christian Crusades are often cited as wars inspired by a single, "jealous" God. What is often implied in the generic argument that religion breeds violence is the unspoken assumption that these religions are monotheistic and, as such, seek the suppression of rival faiths more so than polytheists or nontheists. Yet without reference to the content of different religious creeds, this claim has difficulty accounting for monotheistic religions that do not actively seek converts, as in Judaism, Orthodox Christianity, and the mystics of nearly all faiths. Furthermore, if the logic of monotheism compels believers to promote a universal deity, a God for believers and unbelievers alike, then it must also admit the many positive contributions implicit in the theology of a universal creator. The view that all peoples share a common destiny and dignity is uniquely supplied by the premises of monotheism. The answer to the question "Who is my neighbor?" Augustine (1998) explains, extends beyond those who hold the Christian faith:

Since we do not know the future we should regard everyone as our neighbor, not only because of the condition of human mortality, by which we arrive in this world to share the common lot, but also on account of our hope of that inheritance, for we do not know what someone who just now was nothing may turn out to be.

In Islam, the potential for conversion and the presence of a common destiny is expressed in the legal protections given to the ignorant, the *Jahiliyyah*, and the privileged place of other monotheists, the *al-Kitab*. Contrary to their psychosocial depiction as uncompromising zealots, monotheists are actually more

prone to engage in theological debate and dialogue than their coreligionists, often resulting in greater understanding and respect between rival faiths.

War in Christian Thought

The early Christians considered war to be the responsibility of the Roman Empire, which occupied nearly every context where wars were fought from Europe and Africa to the Middle East. The early Church Father Tertullian commented on war within the context of idolatry and forbade military service, citing Christ's admonition to Peter that those who live by the sword should die by it. Tertullian understood the Church as wholly separate from the political and territorial ambitions of the empire. "Shall he [the Christian soldier] carry a flag too, hostile to Christ?" (Tertullian Ante Nicene Father, Vol. 3, p. 100). For the early Christians, military service in the Roman Empire was the equivalent of serving

Caesar as a "second master," whose iconography, religious rites, and purposes were foreign to the spiritual aims of the persecuted Church.

As Christianity matured within the context of empire following its toleration in 313 CE, the attitude changed from political withdrawal to active engagement with the existing social order. Augustine of Hippo observed the merits of Roman philosophical and legal traditions to further the Christian cause, and his comments on just war represent the first attempt to express Christian doctrines into distinctly Roman formulations. Augustine transformed the classical understanding of statecraft to incorporate the Christian ideal of ordered tranquility, wherein personal sanctity could be preserved with greater ease. Augustine's *City of God*, written at the end of his life and the end of the empire, supplies one of the earliest Christian visions of a just and peaceful society on earth, and his just war theory should be viewed in that context. The Augustinian vision of society

replaces the vicious pursuit of glory with the happiness of ordered tranquility—a position he was forced to defend against accusations that it was antithetical to the success of the empire. The Augustinian position on just war, however, was not strictly defensive but would excuse wars if they furthered the cause of peace, as in the case of helping virtuous people overcome a tyrannical dictator (*City of God*, book iv, chap. 15). This early formulation of a humanitarian war, fought in the interest of the enemy, is morally incumbent on nations with the means to intervene, provided their intentions remain free of vice.

At the center of the Christian formulation of the just war is the alleviation of guilt due to killing in war. If wars were authorized by a legitimate authority, fought for a just cause with proportionate means, then guilt for the sin of murder would not be incurred. After the fall of the Roman Empire, Europe descended into a state of continuous warfare and political instability for centuries. In an effort to cope with this, the Church further regulated war and violence with respect to the individual conscience, a move that effectively distributed the blame for war to all of its participants. The chivalric codes forbid violence on church property and holy days and excommunicated princes who too readily disturbed the peace of Christian order. After William the Conqueror invaded England (1066) with papal permission, ecclesiastical canons prevented his men from entering a church until they had been absolved for shedding blood. These canons underscored the unavoidable evils associated with all wars and assumed that most wars were fought with impure intentions, even those fought under the papal flag.

These codes reveal the survival of conflicting Christian teachings regarding war. On the one hand, war is always an evil to be shunned, but so long as Christians live in a world where violence is unavoidable, they are obliged to temper it by insisting that wars are fought only to achieve peace and restore justice. The pacifist vein of Christian thought survives to the present in the numerous denominations that eschew all forms of violence and in the nearly unbroken run of papal condemnations of war over the past century. With the notable exceptions of the Second World War (1939–1945) and the War in Afghanistan (2001–), Christian churches have become increasingly critical of war over the past century, as the means of war became increasingly destructive.

Since the end of the Second World War, Christian just war theory has undergone a significant renaissance. The invention of nuclear weapons and the formation of permanent multinational organizations such as the United Nations and North Atlantic Treaty Organization introduced several new problems with prevailing definitions of proportionate force, legitimate authority, and just-cause conditions. The range of opinion on the War in Iraq (2003–2011) demonstrated a willingness to significantly revise the principles of just war theory by some to accommodate the possibility of “preventive” war. Despite the vocal efforts of the Catholic scholar George Weigel and others, the Catholic Church under John Paul II and Benedict XVI condemned the Anglo-American military intervention in Iraq in 2003, along with a majority of leaders from other Christian denominations. As an evolving tradition, just war theory remains committed to the principles introduced by its first Christian advocates: a commitment to evaluating the moral intentions of those seeking war and ensuring that the political objectives of war further the aims of an ordered peace.

War in the Islamic Tradition

As in the case of the just war tradition, Islamic commentaries on war must be selected from a variety of sources whose principal purpose is to promote religious, social, and political order. Since the majority of the military campaigns undertaken by the Prophet Mohammed occurred in the last 10 years of his life, after the initial Quranic revelations, the Quran provides an incomplete account of the Islamic doctrine on war. The tradition of sayings and deeds of the Prophet Mohammed in the Hadith correspond to and supplement the Quran’s teaching on jihad and appropriate conduct in war.

Jihad is a term that has entered into the common vocabulary of many non-Muslims without a high degree of understanding. It is commonly understood as “holy war,” or a religiously sanctioned offensive struggle for the purpose of conversion or subjection to the Islamic legal structures of sharia (“right path”) and *fiqh* (jurisprudence). The traditional usage of the term is more varied. Jihad literally means “struggle” or “a striving in the path of Allah.” The spiritual variation is most clearly developed in the Sufi tradition, where jihad is defined as

an interior struggle against the inordinate passions that would lead the soul away from the fulfillment of its religious duties in the Five Pillars and is often referred to as the “Greater Jihad.” The wars fought under the direction of the Prophet Mohammed after 622 CE began a period of expansion lasting several centuries. Many of these wars were considered offensive jihads insofar as they aided in the spread of the prophetic message of Islam throughout the Middle East, North Africa, and southern Europe. Jihad acts to reorient the otherwise strictly political objectives of war toward a supernatural end by incorporating the aims of war into the Greater Jihad that seeks to purify sin through moral action. In most cases, jihad works to place limits rather than grant license in the conduct of war by questioning the legitimacy of the cause for war and by ensuring that basic moral rules are followed. In contrast to conventional wars (*harb*), the jihad is an opportunity for religious honor and merit for those who fight and a source of shame for men who do not. For this reason, the jihad must follow the precepts of the Islamic moral law to avoid becoming a source of corruption and hypocrisy. Wars must end once the enemy or infidel makes an overture for peace, agrees to convert, or accepts payment of the *jizya*—a tax paid by non-Muslims living under Islamic rule in exchange for protection and certain legal rights. The *jizya* was not unlike the feudal tax system implemented in Europe and the Byzantine Empire in the same period and demonstrates a willingness on the part of the *mujahideen* (those who fight in jihad) to accept a political solution to a “holy war.”

Thus far, the concept of jihad has been explained in the context of Islam’s early expansion, when a caliph or imam exercises an authoritative call to jihad that is binding on the entire Muslim community or *umma*. The ease of identifying the legitimate voice of the *umma* diminished in the centuries that followed the death of Mohammed and with it, the collective and binding obligation of the offensive jihad. The basis of authority since the rule of the Four Righteous Caliphs (632–661 CE) has thought to reside collectively between Muslim clerics and the consensus view of most Muslims. Since consensus is most easily reached in defensive rather than offensive wars, most jihads since the initial Islamic conquests (622–750 CE) have taken the form of defensive wars against foreign invasion.

Political Islam and “Islamism”

After the end of the First World War (1914–1918), the former territories of the Ottoman Empire (1299–1923) came under the administration of the mandate system of the League of Nations, which sought to reconstitute the region according to the nation-state model of Western Europe. This was done in large part because of the independent emergence of Arab, Persian, Palestinian, and Armenian nationalism. During the war, the British, French, and Russians supported and exploited these nationalist movements to further destabilize the Ottoman Empire, an ally of the Central Powers. While the nation-state model prevailed in the Middle East, with the support of the League of Nations and later, the United Nations, the alternative view of a pan-Islamic empire under Arab leadership had not been altogether extinguished. The Islamist view gained ascendancy in the 1940s, with groups including the Muslim Brotherhood acting as shadow governments in Egypt, threatening its secular-nationalist leadership. The Islamists argue that Islam is able to provide both religious and political government in the Middle East and has, through most of the 20th century, targeted nationalist leaders who, in their view, constitute the chief obstacles to the establishment of a pan-Islamic empire. Acts of violence, terrorism, and martyrdom are intended to provoke and awaken the *umma* to their political oppression by their government and their moral oppression by the values of the West. Osama bin Laden was marginally successful in shifting the emphasis away from secular rulers, the “henchmen” as he described them, against the United States and Western governments that supported these secular regimes. The intellectual influences of bin Laden and Ayman Zawahiri, the current leader of al Qaeda, were unmistakably derived from the rhetoric of Islamism. Nonetheless, the ideology of global jihad represents a deviation not only from Islam but also from the political aims of Islamism, whose primary aim is the replacement of secular nationalism with Sharia law and clerical leadership.

The War on Terrorism and al Qaeda

The counterterrorism strategy of the U.S. government has come to dominate American foreign policy over the past 10 years. During the Clinton administration (1993–2001), the U.S. policy regarding terrorism fell under the category of international crime prevention. According to the 9/11 Commission, the success of

the Federal Bureau of Investigation in apprehending those responsible for the World Trade Center bombing in 1993 had the unfortunate result of confirming the readiness of counterterrorist measures already in place, prompting few reforms to the existing strategy. Since suicide bombing was not a tactic employed in 1993 or in the Bojinka plot (1995), where a dozen bombs were sent on planes from Asia to the United States, existing security measures that relied on terrorists' sense of self-preservation remained in place. Counterterrorism measures were woefully unprepared for religiously motivated acts of terrorism, suggesting an unwillingness to understand or interfere in religious traditions opposed to American foreign policy. Following the attacks on September 11, 2001, the Bush administration's National Strategy for Combating Terrorism (NSCT; 2003) explained that the United States was not at war with Islam, but engaged in a "War on Terror." The strategic objectives of the National Strategy for Combating Terrorism not only focused on degrading the global reach of terrorists but also brought attention to the underlying causes of terrorism. U.S. policymakers understood the root cause of terrorism to be political alienation, a condition that could be remedied by promoting democracy and "winning the war of ideas." The latter aim of the strategy is elaborated in subsequent versions of the National Strategy for Combating Terrorism to mean promoting moderate Islam and supporting the veins of Islamic thought that condemned the tactics and ideology of al Qaeda. Since the death of Osama bin Laden in 2011, even greater attention has been devoted to degrading al Qaeda's capacity to inspire individual acts of terrorism. Al Qaeda's ability to plan and carry out a terrorist attack had been significantly impaired, but the potency of its message continues to inspire individual acts of terrorism. To counteract these efforts, the U.S. strategy has sought to disrupt al Qaeda's ability to spread its message and to neutralize the potency of wedge issues cited by bin Laden that would further enrage Muslims to attack the United States. To this end, the United States has demonstrated a willingness to participate in the theological debates of Islam to further its own national security interests.

Conclusion

Samuel Huntington, one of the most influential political scientists of the past century, suggested in

his influential essay, "The Clash of Civilizations," that the ideological polarity between communism and capitalism had given way to "civilizational" allegiances between the nations of the world. Five out of seven of Huntington's civilizations are classified in religious terms: Islamic, Hindu, Slavic-Orthodox, Confucian, and the Christian West. The remaining two include Latin America and the Japanese, whose civilizational identities are deeply indebted to Catholicism and Shintoism, respectively. The Cold War (1945–1991), Huntington explained, suppressed the antagonism between the civilizations, compelling nations to align themselves between the capitalist "West" and the communist "East." Huntington's theory was employed to explain the sudden eruption of violence in the Balkans, resulting in the breakup of Yugoslavia beginning in 1989. The dissolution of tensions between East and West exposed "civilizational" and ethnic hostilities between Muslims and Orthodox Christians living in this multinational state. Huntington considered religiously divided states to be particularly prone to political unrest in the years that followed the collapse of the Soviet Union. The Cold War only suspended the divisions between the culturally asymmetrical "Islamic World" and the West, and while the United States and the mujahideen had once been allied against the Soviets in Afghanistan (1979–1989), the two civilizations to which they belonged could not sustain their cooperation without a common enemy. It is undoubtedly the case that religion plays a more prominent role in American foreign policy today than it did even a decade ago, but it was a policy shift brought about by the events of 9/11 and the experience of fighting the "War on Terror." Long-standing avoidance of religious questions in the West were born out of the unique historical experiences of the Protestant Reformation and the Enlightenment—experiences and perspectives not shared by the rest of the world. When Tony Blair was asked about his faith in an interview in 2003, a representative of British government tritely quipped "We don't do God." Yet the fact remains that most of the world's population is religious. Failure to evaluate the claims of religious faith as ideology has proven untenable as secular ideologies cease to hold sway in many parts of the world with religions rising to replace them. In the history of the United States, there are numerous instances when commanders sought the advice and counsel of military chaplains to better

understand the motivations of their enemy. A similar pooling of scholarly resources has occurred since the attacks on 9/11. As the war on al Qaeda draws to a close, leaving its members with only the ability to inspire independent and small-scale acts of terrorism against the United States and its allies, it is essential that policymakers understand and challenge the religious ideologies that threaten global security in the post–Cold War era.

RESEARCH AND DEVELOPMENT

Research and development has been and remains a key focus of both the U.S. government and the military. As a world leader in military technology—to say nothing of nonmilitary technology—the U.S. research and development (R&D) infrastructure is one of the finest in the world. Supported on every level from government contracts to industrial production to corporate think tanks and American innovators, the system of R&D in the United States leads the world in technology innovation. Modern militaries rely heavily on advanced R&D; the U.S. military continues this historical trend. Since World War II, the U.S. military can be characterized by its high-technology to compensate for fewer numbers. The U.S. military historically relies on technology rather than manpower.

Research is the search for new solutions to existing problems. Research can be further divided into *pure* and *applied*. Pure research is often unguided exploration of possible technologies without a specific direction. A current example is battlefield microwave technology, which may or may not pay off in actual weapons systems. However, pure research often yields spin-off technology that is useful for military or commercial uses; in this case, microwave ovens and microwave radar. Applied research is investigation into specific battlefield problems, with the intention of providing answers. Applied research is the more common of the two, where scientists and researchers try to find solutions to existing problems. Examples include counterimprovised explosive device technologies, hypersonics, fuels research, and ballistics. Development is simply putting successful research into production for use in the field. This entry examines the functions and activities of R&D as they pertain to the U.S. government and military.

Research

U.S. R&D began in earnest during World War II, with conscious efforts toward high-technology weapons systems married to American industrial capacity. During the war, the United States was geographically

isolated from battlefields in Europe and the Pacific (with the exception of the U.S. territories attacked at Pearl Harbor, Hawaii) and, thus, was able to maximize industrial output for the war in complete safety. In addition, the United States was able to build increasingly better military hardware for use in both theaters, thanks in part to the abundance of government contracts and intellectual capacity both in the United States and from abroad. The Manhattan Project represented the pinnacle of R&D during the war, a project in which scientists and engineers from the United States and Britain worked together in a secure location in Los Alamos, New Mexico, and by the end of the war developed two successful types of atomic weapons. First tested in July 1945, two were dropped on Japan in August, helping force that country's surrender. The highly secret project was also incredibly expensive, and combined important facets of military R&D: high cost and security. It's also significant that the Allied governments (in this case, the U.S. and British governments) funded a project that was merely a possibility; no one knew for sure that it would work beyond the theoretical. Thus, the dual importance of the *research*—to determine the feasibility—and the *development* is evident in the production of the first atomic weapons.

In the immediate post-World War II era, the United States led the world in technology R&D. In the wake of the most devastating war in human history, and with the lead in military technology, the president (then Harry S. Truman) decided to commit resources to R&D in order to maintain American predominance in technological development. This led to the birth of the U.S. military-industrial complex, the coupling of government spending, industrial production (including R&D), and military systems' development and use. A vital part of both our economy and society, it is also often maligned for its influence in American government.

President Franklin D. Roosevelt oversaw the creation of the first two dedicated American R&D organizations during World War II—the National Defense Research Committee, founded in 1940, and the Office of Scientific Research and Development, founded in 1941. Vannevar Bush headed the famous and influential Office of Scientific Research and Development, which had been instrumental to government-military-industry coordination since World War I. Each organization represented a government-sponsored entity focused on the development of high-technology

weapons systems during war; each was granted vast amounts of intellectual and financial capital and was not hindered by strict government oversight. Massive resources and flexibility facilitated incredible advances in technology but, at the same time, set a dangerous precedent for the relationship between government and industry. Wartime industries transitioned into postwar peace with the confidence that high-paying government contracts would be awarded with minimal government oversight. The companies that survived military downsizing at the end of the war were able to continue military production without government restrictions, often leading to less than transparent business practices. With the expansions of the defense budget in the 1950s and 1960s and increased military spending, bad business and financial practices inside the military-industrial complex became commonplace.

At the end of the war, the U.S. Army Air Forces—which did not gain independence until 1947—spun off Project RAND (for R&D), initially managed by the Douglas Aircraft Company. In 1948, RAND became an independent consultant for the U.S. government and other international clients. Symptomatic of other think tanks, RAND combines academics, businesspeople, and former and current military personnel for varying types of analytical research. Often the client (frequently the government) will approach the think tank with an issue and ask for analysis of a topic or problem. Most often, the organization is tasked with directed analysis. Rarely are these think tanks in the business of development; instead, they focus on research. RAND, which to this day provides excellent research and analysis to the U.S. government, currently offers both classified and open-source information on a wide variety of topics. For instance, RAND is currently a leader in China-related analysis.

The American university system exemplifies another source of military research. Connections between the government and universities go back to World War II, when scientists and engineers were approached to help with research issues. After the war, the government instituted the G.I. Bill, which sent servicemen and -women to school. This accomplished two goals: (1) demobilized servicemen could get an education and (2) the overall educational level of the population increased. Universities continue as a research source to this day. Universities like Massachusetts Institute of Technology and

California Institute of Technology are well known as centers for government research, but a tremendous number of universities compete for government funding for both classified and unclassified research dollars. The funding is often so lucrative that the universities rely on government contracts not only for specific projects but also for general operating costs.

Not all government research can be conducted in the relatively open arena of American universities, however. The government has also set up a number of research laboratories, usually staffed by civilian contractors, to conduct sensitive and high-technology research. The government money creates lucrative jobs for research scientists and makes the research field attractive for graduate studies in a number of fields. The Jet Propulsion Laboratory (affiliated with California Institute of Technology), the National Institute of Allergy and Infectious Diseases, and the Los Alamos National Laboratory—the largest such organization—represent a few of the many government research labs. Of the dozens of government research labs, the Los Alamos National Laboratory is a model for government-sponsored research. The 15,000 employees, with an annual budget of more than \$2 billion, research weapons systems for the military, space applications, and medical technology. Los Alamos National Laboratory is one of only two government labs where nuclear weapons design continues in this country.

Research in these spheres comes at the behest of the government, complete with lucrative taxpayer dollars. Often, the government will present a problem or issue for analysis, and research facilities will commit intellectual resources to solve the problem, often in a number of different ways. These collections of doctors, engineers, scientists, physicists, and others work directly for the government, or indirectly through their own universities, to analyze and solve big questions. Once questions are answered, the next phase begins.

Development

The development side of the equation is inextricably linked to research. When a workable solution emerges, the government will approach industry to build the solution. Frequently, there is a competition opened to construct multiple prototypes (e.g., airplanes or small arms), but often the government will ask a single company to develop a specific

technology. To return to a previous example, when the Manhattan Project was under way, the government did not consult a specific company to develop the bomb once the theoretical work had been completed. Instead, the government constructed the industry and gathered the materials, which were brought to Los Alamos, so that the bombs could be built there. Currently, the government has a number of manufacturers that are preferred contractual clients. Companies such as Boeing and Lockheed Martin supply airframes and missile technology for the air force; the Electric Boat Corporation—part of General Dynamics, located in Connecticut—is the sole supplier of nuclear submarines for the navy. However, in the 21st century, a large portion of military technology will be revolutionary; the government will again begin to farm out contracts to smaller and more diverse manufacturers. One leading example is software design, which is being contracted by large companies like Microsoft but is also being procured from independent computer companies and code writers. Another fascinating example is the future of unmanned aerial vehicles; the government has taken an interest in radio control enthusiasts for tactical (small) unmanned aerial vehicles and their component technology. As other technologies emerge, a wide variety of corporations and individuals will be involved in the military's procurement process.

One continuing issue in the development of the military's technology is supply. It is not enough to have one or two models; the military needs multiples, often thousands. Even the largest—and most expensive—systems, like the nuclear aircraft carrier, come in multiples (currently 12). Aircraft are ordered by the dozens; when the army adopted the Beretta 92 sidearm pistol (military designation M9) in the late 1980s, it bought more than 500,000. The issue dominating the development phase of R&D is manufacturing capacity. The government must consider if a company bidding on a potential contract will be able to produce the numbers needed for the military as a whole. Questions such as infrastructure, employee base (and reliability), security measures and secrecy, and materials supply all become issues during development. Furthermore, government oversight is a reciprocal consideration for companies who desire the lucrative contracts; they must be willing to accept a certain amount of structure and supervision; more as the secrecy level rises.

R&D is an integral part of modern military development. To have continual strategic advantage, modern militaries focus on cutting-edge R&D. In the United States, this takes the form of both pure and applied research and an interconnected system of development industries for the production of military hardware. To stay ahead of actual and potential threats, the United States devotes tremendous amounts of resources, brainpower, and industrial effort toward R&D to maintain a high-technology force, prepared for present-day and future conflict. And, it is a continual process; technological evolution is an ongoing process. The country that puts forward the most effort and funding will maintain the competitive advantage on the 21st-century battlefield.

RESERVE, AIR FORCE

The Air Force Reserve is component of the U.S. Air Force, along with the Regular Air Force and the Air

National Guard. Together, the Air Force Reserve and the Air National Guard constitute the reserve components of the air force. The differences between the two reserve components are slight, mainly in that members of the Air National Guard have an additional liability for service under state authorities, whereas members of the Air Force Reserve do not. The Air Force Reserve is a Major Command of the U.S. Air Force. In the first decade of the 21st century, the reserve components of all services were increasingly seen as operational reserves rather than strategic reserves. In practice, this means that reserve forces are used as part of normal operations and are not considered for use only in major wars. This entry traces the history of the U.S. Air Force Reserve and discusses its organization, operations, and roles.

Air Force Reserve Command has more than 74,000 officers and enlisted personnel in 37 wings

with their own aircraft, as well as seven associate units, which share aircraft with an active-duty unit. The Air Force Reserve provides slightly more than 10% of the air force's available personnel. Each wing is charged with a core mission that is accomplished through the collaboration of a variety of specifically tasked squadrons. Reserve wings report to one of three numbered air forces, which in turn report to Headquarters, Air Force Reserve Command.

Air Force Reserve units perform a vast array of services as part of the total air force, including medical services and medical evacuation, establishing and operating aerial ports, civil engineering, security, intelligence, communications, mobility support, logistics, and transportation operations. The Air Force Reserve has more than 440 aircraft assigned to it, most of which are the same type found in Regular Air Force units, such as the massive

C-5 Galaxy, as well as the C-17 Globemaster III for transport; the KC-10 Extender and the KC 135 Stratotanker for aerial refueling missions; fighter aircraft, such as the F-16 Falcon and the F-22 Raptor; and the A-10A/O Thunderbolt II for ground attack missions. In addition, the Air Force Reserve inventory includes multiple variations of the venerable C-130, including some ski-equipped for polar operations, others equipped for weather reconnaissance, and some equipped for fighting forest fires.

Members of the Air Force Reserve serve in one of several statuses, the largest of which is the Unit Program. The Unit Program consists of manned units that normally perform duty on 1 weekend a month and for 2 weeks in the summer, although the actual requirements are usually larger. Another status is that of individual mobilization augmentee, which includes reserve airmen who are assigned to active air force units. Individual mobilization augmentees have lesser commitments in peacetime, usually 24 days spread over the course of a year, but can be recalled in times of war or other emergency. Other reservists serve on limited tours with active-duty units, usually at higher levels of command, to fulfill critical positions. A substantial minority of members of the Air Force Reserve serve on either Active Guard and Reserve status, which gives them essentially the same status and benefits of members of the Regular Air Force, or as Air Reserve Technicians, in which members of a reserve unit hold a civilian job in the unit when not mobilized.

Members of the Air Force Reserve belong to the Ready Reserve, the Standby Reserve, the Individual Ready Reserve, or the Retired Reserve. The Ready Reserve, consisting mainly of members in the Unit Program, contains roughly 74,000 reservists subject to recall to active duty in time of war or national emergency. These reservists are liable for deployment worldwide within 72 hours. The Standby Reserve includes reservists with a temporary disability that makes them unable to perform military duties, or whose civilian jobs are considered vital to national defense. Member of the Individual Ready Reserve are former members of any component—Regular Air Force, Air National Guard, or Air Force Reserve—with a remaining service obligation. They are civilians but are theoretically still qualified in their specialty and can be recalled to active service in

the event of a national emergency. The last category, the Retired Reserve, consists of former airmen, whether regular, guard, or reserve, who receive pay after retiring from the air force. The Retired Reserve also includes “gray area retirees,” former members of the reserve or Air National Guard who left service after completing 20 years of service but who have not yet reached 60 years of age, when they start drawing a pension.

History

The Air Force Reserve evolved out of aviation elements of the Army’s Organized Reserve, the precursor to the modern Army Reserve, of the 1930s. Just prior to World War II, all reserve components were called to active service, and as a practical matter, no reserve existed. When the air force was established as a separate and coequal branch of the U.S. military on July 26, 1947, no provision for a reserve existed. The air force desired a fully federally controlled reserve, and not an air element in the National Guard, but the National Security Act of 1947, which created the independent air force, also created the Air National Guard. Noting the existence of hundreds of thousands of former members of the wartime Army Air Forces not in the Air National Guard but with an interest in serving in a reserve status, Congress passed legislation for the establishment of the Air Force Reserve on April 14, 1948. As with the army, the air force would have two reserve components.

The Air Force Reserve originally had 25 wings, equipped mostly with equipment left over from World War II. Despite President Harry S. Truman’s Executive Order 10007 in 1948, which required all branches of the military to create a robust reserve system, the Air Force Reserve had an ill-defined mission, obsolete equipment, and uneven training. The Regular Air Force saw future warfare as consisting mainly of strategic warfare, using manned bombers to drop nuclear weapons on the Soviet Union. In such a scenario, war would be fought in hours or at most days, with no time to recall or employ the reserve components. During the Korean War, the air force called up about 147,000 reservists, serving periods from 1 to 3 years on active duty. Most reserve units of the time were either airlift or rescue units. Of the 20 units

called to active duty, five remained intact, while the others were broken up and their members used as individual replacements.

The Korean War showed the air force that future missions would be more than using bombers to drop nuclear weapons on the USSR. Although the reserve components were unsuited for that mission, they could fill most other roles in the air force. Dissatisfaction over the employment of the reserve in Korea led the air force to develop a more integrated plan for using the reserve in the future. Most significant was the air defense runway alert program, which began employing the reserve components for real-world peacetime missions. This integration of the reserve components foreshadowed the Total Force Policy that the air force used with great success in the 1990s, by structuring the entire air force in such a way that reserve and Air National Guard units were integral parts of the air force.

Cold War

During the Vietnam War, the Air Force Reserve performed real-world missions in support of air force operations worldwide. Reserve wings began performing troop transport missions during their weekend drills and 2-week annual training. In 1968, the Department of the Air Force redesignated the Headquarters, Air Force Reserve, as a field operating agency. The Air Force Reserve participated in operations after Vietnam, with 630 reservists serving in the Middle East in 1973, and ferrying civilians from Grenada in 1983. The Air Force Reserve gained new missions in aerial refueling, weather reconnaissance, and tactical fighters, in addition to its traditional role in transport. The air force began to equip the reserve with first-line equipment rather than issuing obsolete material formerly used by the Regular Air Force. In the 1970s, most large cargo aircraft used for airlift belonged to regular units, but reserve crews flew them. During the 1980s, more aircraft were assigned to the reserve, including aerial refuelers such as the KC-10s, and the ground attack A-10s, and in 1984, F-16s fighters.

Persian Gulf War

At the start of Operation Desert Shield/Desert Storm in August 1990, the Air Force Reserve consisted of 21 wings, with 335 squadrons, of which 58

were flying squadrons. Some 22% of personnel in the Air Force Reserve volunteered individually for active service, which caused problems later when reserve units were activated and found to be short of personnel. The first Air Force Reserve units to deploy were aerial port units that began operations in Saudi Arabia on August 8. By August 20, more than 15,000 Air Force reservists were performing duty in support of Desert Shield. Despite the diversity in capabilities in the reserve, the force was still heavy in airlift and refueling units. By the time that conflict ended, units from the Air Force Reserve had flown 239,000 hours, moved 310,000 passengers, delivered 560,000 tons of cargo, and brought almost 10 million gallons of fuel into the theater. Tactical aircraft of the Air Force Reserve flew more than 3,200 sorties, while A-10s made 1,000 sorties. A total of almost 23,500 Air Force Reservists served in the war.

Following the end of the Gulf War, elements of the Air Force Reserve became involved in humanitarian relief missions, such as Operation Provide Comfort, which assisted the Kurds. Air Force Reserve tankers and fighters helped enforce the no-fly zone over Bosnia in 1993. In recognition of its increased participation in ongoing missions, in February 1997, Congress made the Air Force Reserve Command the ninth Major Command of the U.S. Air Force, with headquarters at Robins Air Force Base, Georgia. Reserve units later became heavily involved in the federal responses to Hurricanes Katrina and Rita, which hit the Gulf Coast of the United States in 2005. Air Force Reserve units delivered 3,300 tons of relief supplies, and the 910th Airlift wing sprayed insecticides on more than 2.8 million acres of affected areas to prevent an outbreak of insect-borne diseases following the storms.

Global War on Terrorism

As a response to the attacks of September 11, 2001, President George W. Bush ordered 13,000 members of the air reserve and air guard to active duty for up to 2 years. In the days immediately after the attacks, reserve F-16s, supported by KC-135 tankers and airborne warning and control systems, flew air cover missions over American cities. On October 19, a reserve MC-130E Combat Talon became the first U.S. fixed-wing aircraft to enter the skies over

Afghanistan. Reserve F-16s, already in the region for Operation Southern Watch, began combat operations as part of Operation Enduring Freedom, which sought to remove the Taliban from control of Afghanistan. Air Force Reserve units provided B-52 strikes and close air support. Reserve C-17s airdropped emergency food supplies to Afghan civilians. The air force relied heavily on its reserve components to maintain its two “air bridges” across the Atlantic and the Pacific.

During Operation Iraqi Freedom, the war to overthrow Baathist rule of Iraq that began in March 2003, Air Force Reserve and Air National Guard pilots flew almost continuous missions in F-16s and A-10s. Reserve crews flew 40% of all B-52 strikes during the initial phase of the war. Reservists also participated in missions using unmanned aerial vehicles. By 2009, reservists performed more than 86,000 sorties by fighters, 418,000 mobility sorties, and 116,000 air refueling sorties. Reservists have also played a major role in aeromedical evacuations of sick and injured troops from the war zones to Ramstein Air Base, Germany. More than half of the personnel in the 791st Expeditionary Aeromedical Evacuation Squadron were reservists. By 2007, 55,000 patients had been moved. More than 90,000 Air Force reservists have provided support to the war since 2001, with more than 30,000 Air Force reservists serving mobilization tours.

RESERVE, ARMY

The Army Reserve is a component of the U.S. Army, along with the Regular Army and the Army National Guard. Together, the Army Reserve and the Army National Guard constitute the reserve components of the army. The differences between the two reserve components are slight, mainly in that members of the Army National Guard have an additional liability for service under state authorities, whereas members of the Army Reserve do not. Also, the Army National Guard has more combat arms units—infantry, armor, and special forces—whereas the Army Reserve contains almost entirely combat support and combat service support units. This entry discusses the organization, history, and roles of the Army Reserve.

Members of the Army Reserve serve in one of several statuses, the largest of which is the Troop Program Units (TPUs). TPUs consist of units that normally perform duty 1 weekend a month and from 2 weeks to 29 days annually. Another status is that of Individual Mobilization Augmentee (IMA), IMAs are assigned an annual period of 2 weeks for training in high-level headquarters where they would serve if mobilized. Active guard and reserve soldiers belong to the Army Reserve but are on a full-time status and have the same benefits and legal status as members of the Regular Army. Most active guard and reserve soldiers perform the full-time administrative duties required by a reserve unit while it is not in a mobilized status.

In 2010, the strength of the Army Reserve was about 205,000 soldiers, not counting retirees. Reserve soldiers belong to the Ready Reserve, the Standby Reserve, the Individual Ready Reserve (IRR), or the Retired Reserve. Reservists in the Ready Reserve, consisting mainly of members of TPUs, are subject to recall to active duty in time of war or national emergency. The Standby Reserve includes reservists with a temporary disability that makes them unable to perform military duties or whose civilian jobs are considered vital to national defense. Member of the IRR are former members of any component—Regular Army, Army National Guard, or Army Reserve—who have a remaining service obligation. They are civilians but are theoretically still qualified in their specialty and can be recalled to active service in the event of a national emergency. The last category, the

Retired Reserve, consists of approximately 715,000 former soldiers from any component who receive pay after retiring from the army. The Retired Reserve also includes “gray area retirees,” former members of the reserve or Army National Guard who left service after completing 20 years of service but have not yet reached 60 years of age, when they start drawing retirement. The U.S. Army Reserve Command (USARC) is responsible for TPU soldiers, while the U.S. Army Reserve Personnel Command manages IRR and IMA soldiers.

The Army Reserve contains 45% of the army’s combat service support units and 30% of its combat support units. As part of the Total Force Policy adopted in the 1970s, some necessary support functions of the army were shifted to the reserve and National Guard, making mobilization of at least some of the reserve components necessary in any protracted conflict. As a result, the Army Reserve has only one combat line unit and two attack helicopter battalions but contains 100% of the army’s railway units, 100% of its enemy prisoners-of-war brigades, 100% of its training and exercise divisions, 100% of the army’s bridging assets, 97% of its civil affairs units, 86% of its psychological operations units, 70% of its medical care units, and 62% of its chemical and biological defense capability, half of all mortuary affairs units, as well as aviation, logistics, engineer, and signal units.

The Chief, Army Reserve, is the advisor to the army chief of staff on Army Reserve issues and also holds the position of commander of the USARC. USARC is based in Atlanta, Georgia. The USARC commands all continental U.S. Army Reserve units. The Army Reserve operates 1,200 Army Reserve Centers throughout the nation. The Army Reserve maintains one Command and two Reserve Support Commands outside the continental United States.

History

The Army Reserve began in 1908 with the establishment of the Officers Reserve Corps and Enlisted Reserve Corps. Few men joined, and not until after the First World War did a wholly federally controlled reserve of the army come into existence. Between the World Wars, the Organized Reserve, as it was dubbed, consisted of cadre units with leadership only. Members were not paid for weekly evening training meetings but only for their 2 weeks of

training in the summer, and no retirement system existed. The Organized Reserve was called to active service in the fall of 1940 for a year for training. Reserve units absorbed the largest portion of the men brought on active duty under Selective Service, while other selectees went to regular and National Guard units. After the attack on Pearl Harbor on December 7, 1941, everyone on active duty was ordered to remain as long as needed.

At the end of the Second World War, the army revamped the reserve, creating manned units as well as pay and retirement systems. The reserve functioned as a strategic reserve, only to be mobilized for major military events, primarily envisioned as a war with the Soviet Union. However, shortages in the active military led to a large, although not total, mobilization of the reserve for the Korean War. Of some 600,000 reservists on the rolls in 1950, around 240,000 were called up during the war, either as individuals or as part of one of 971 units that were mobilized. The Organized Reserve was officially renamed the Army Reserve in 1952.

Vietnam War

For political and global strategic reasons, the Army Reserve remained unmobilized during most of the Vietnam War. The army fought the war mostly using its peacetime structure of regular soldiers in units augmented with draftees. However, the bulk of the company grade officers, lieutenants, and captains who fought in Vietnam held reserve commissions but served on active duty. In response to the Tet Offensive in early 1968, and increased tensions with North Korea over the seizure of the USS *Pueblo* on January 23, 1968, the Joint Chiefs of Staff requested 54,000 men from the various reserve components to backfill the Strategic Reserve, with most of them slated to serve on active duty in the United States or in Europe, rather than be deployed to Vietnam. On January 25, 1968, President Lyndon Johnson ordered a limited mobilization of the Army Reserve. Politics and budget concerns trimmed the number of Army reservists mobilized to 5,869 soldiers from 42 Army Reserve units, of which 35 units went to Vietnam. While complaints from mobilized Army reservists tended to be fewer than from air force and navy reservists similarly called to active service, complaints did occur, and some members of Congress sought to delay their deployment.

The overall impact of the reserve units on the course of the war was minimal. At their peak, Army Reserve soldiers totaled less than 5% of all American soldiers in Vietnam. Likewise, only a small fraction of reserve soldiers mobilized for the war in Vietnam, either for deployment to Vietnam or to provide backfill in the strategic reserve. The shortcomings of the mobilization of some Army Reserve units in 1968 later influenced the reform of the Army Reserve in the 1970s.

After the end of the draft in 1973, the Army Reserve lost much of its strength, as reservists who joined to avoid the draft left in droves. Concurrent with the ending of the draft was the implementation of the Total Force Policy. Under Total Force, the Guard and reserve were more fully integrated with the active force. In the 1990s, most of the reserve combat arms units remaining were disbanded or converted to support functions. The Army Reserve became composed of almost all Combat Support and Combat Service Support units.

Persian Gulf War

More than 63,000 reservists from 647 units served during Operation Desert Shield/Operation Desert Storm. In addition, more than 1,500 IMAs and 5,500 reservists in the IRR mobilized, while another 1,000 came from the Retired Reserve. Units and members served in theater, and backfilled in Germany and the United States. Following the war, the Army Reserve underwent substantial reorganization. In 1992, the USARC became operational and assumed command and control of most units in the Army Reserve.

Roughly 100 reservists, mostly in the 711th Adjutant General Company (Provisional), deployed to Somalia in 1993 under Operation Restore Hope. Additionally, civil affairs and public affairs units also served in the operation, until all U.S. forces were withdrawn in March 1994. The following year the 20 Army Reserve Commands were reorganized into 10 Regional Support Commands, which were in turn redesignated Regional Readiness Commands in 2003. In 1995, President Bill Clinton issued a Selected Reserve Call-up, allowing for the mobilization of reservists for Operation Joint Endeavor, which was created to support the Dayton Peace Accords in Bosnia. Throughout the remainder of the decade, reserve units would participate in operations

responding to floods in North Dakota, a dam break in New Hampshire, a typhoon in Guam, and in 1999, thousands of reservists assisted in the recovery efforts after Hurricane Mitch ravaged Central America.

Global War on Terrorism

Three days after the attacks of September 11, 2001, President George W. Bush ordered a partial mobilization of the reserve; although by that time, about 2,300 reservists were already serving in response to the attacks. The first USAR unit to respond was the 311th Quartermaster Company (Mortuary Affairs) from Aguadilla, Puerto Rico. The unit was at the Pentagon within 72 hours of the attack, although official orders were not issued for over a week. The 311th Quartermaster Company established a temporary morgue and began searching for human remains. Within 3 months, more than 9,000 reservists were on active duty under the mobilization. Of these, 384 were from TPUs, while the remaining reservists were IMAs or from the IRR. About 2,300 reservists in 90 units supported Operation Enduring Freedom, which toppled the Taliban government in Afghanistan and sought to break up al Qaeda forces training there. Most of these reservists were in civil affairs, military intelligence, public affairs, and medical units. As the war expanded, reservists served with several Central Asian allies of the United States, as well as in the Philippines and at Guantanamo Bay, Cuba.

During Operation Iraqi Freedom, the invasion of Iraq that began on March 20, 2003, reservists were included in the frontline troops, especially units such as the 459th Engineer Company, whose bridging assets were crucial for river crossings. After the announcement that major combat operations had ceased on May 1, 2003, reserve units and individual soldiers continued to serve in Iraq and in all theaters of the war. Reserve units took on roles never imagined just a few years earlier, as when the 98th Division (Institutional Training), which had been created to augment initial and advanced training for new recruits in the U.S. Army, deployed to Iraq to assist in training the new Iraqi army. By 2009, more than 167,000 U.S. Army reservists had been mobilized for the war, and of that number, more than 40,000 had been mobilized at least a second time. By December

2007, 153 U.S. Army reservists had been killed in the wars, while another 1,230 had been wounded in action.

Current State of the Army Reserve

From the beginnings of the Army Reserve until the mid-1990s, the Army Reserve mobilized nine times. In the years since 1995, soldiers from the reserve have deployed for 10 operations. Reservists have been in a continuous state of mobilization for over a decade, with an average of around 9,300 reserve soldiers mobilized each year. This has led to a major shift in thinking about the role of the reserve components, from a strategic reserve to be used only in major wars to an operational reserve. Units and members rotate through periods of mobilization to perform real-world missions as part of the total force, alternating with periods of nonmobilization. In the years 2007 to 2009, the Army Reserve largely realigned so that larger units were organized by function rather than geographically. For example, all engineering units in the reserve became part of either the 412th Engineer Command, in Vicksburg, Mississippi, or the 416th Engineer Command, in Darien, Illinois. Likewise, training commands are now organized by the level of training they conduct rather than by the area of the country covered. The Army Reserve in 2009 operated on 5.5% of the army's total budget, yet it provided half of the combat support functions.

RESERVE, MARINE CORPS

The U.S. Marine Corps Reserve was officially established on August 29, 1916, as part of the Naval Appropriations Act. Intended to increase American naval preparedness and place the Marine Corps on a firmer footing as an independent branch, the act provided for the wartime expansion of the Marine Corps in the event of national emergency. Marine auxiliaries were to be composed of several elements, including a Fleet Marine Corps Reserve, a Marine Corps Reserve, a Volunteer Marine Reserve, and a Marine Corps Flying Reserve.

With the exception of Vietnam, the Marine Corps Reserve has played a significant role in every major American conflict of the 20th century. In World War I, reserves constituted a significant number of the nearly 32,000 marine officers and enlisted men who served overseas in the American Expeditionary Force and naval service. In World War II, a majority of the nearly half million marines who served were affiliated with the reserve. This constituted somewhere between 68% and 70% of all active-duty marines. However, reservists were not mobilized or put into service as members of reserve units; they were integrated with active-duty marines throughout the war, and no distinction between the two was made. The Marine Corps participated in nearly every significant engagement in the Pacific, suffering 19,733 killed and 67,202 wounded over the course of the war. Of the 79 marines who received the Medal of Honor during World War II, 44 were Marine Corps reservists.

In Korea, the Marine Corps Reserve once again constituted the bulk of overall marine forces. As in World War II, reserve forces were integrated with regular forces. Elements of the reserve, including both ground and air elements, played a major role in the fighting and distinguished themselves in operations such as the amphibious landing at Inchon and the Chosin Reservoir campaign. Due to their large presence within the overall marine forces, reservists sustained a significant portion of the more than 28,000 marine casualties suffered between 1950 and 1953. Combat awards for reservists who served in Korea included 13 Medals of Honor, 50 Navy Crosses, and more than 400 Silver Stars. During the Vietnam War, marine reserves, along with the reserve components of the other services, were not

mobilized. This was largely due to the political calculations of President Lyndon B. Johnson's administration. However, many individual Marine reservists volunteered for active-duty service in Vietnam.

The 1991 Persian Gulf War saw the largest mobilization of the reserves since Korea, with more than 25,000 Marine reservists deployed throughout Southwest Asia, the Pacific, and the United States. The Marine Reserve activated almost all its combat elements, including its infantry and armored and support units, which were sent in support of Marine Expeditionary Forces deployed in Operation Desert Shield and Operation Desert Storm. Reservists constituted roughly 15% of all in-theater marines.

The current organizational structure of the Marine Corps Reserve was created during the 1960s, when the Organized Marine Corps Reserve became part of the Fleet Marine Force. It comprises a ground combat element (the 4th Marine Division), an aviation combat element (the 4th Marine Aircraft Wing), a logistics combat element (the 4th Marine Logistics Group), and a mobilization administration element (the Marine Corps Individual Reserve Support Activity). In 1977, the headquarters of the 4th Marine Division and the 4th Marine Aircraft Wing were consolidated and later unified in 1992 as the Marine Reserve Force, the largest command in the Marine Corps. In 1994, it was renamed the Marine Forces Reserve (MARFORRES).

MARFORRES has four subordinate commands. The 4th Marine Division is the ground combat arm of the reserve. It comprises nine infantry battalions, three each from the 23rd, the 24th, and the 25th Marine Regiments. It also includes artillery, combat engineer, reconnaissance, tank, assault amphibian, light armored reconnaissance, and antiterrorism battalions. The 4th Marines Logistics Group is the reserve's combat support branch. It consists of nine battalions, including maintenance, supply, engineer support, landing support, motor transport, communications, medical, and dental battalions. The 4th Marine Aircraft Wing includes two aircraft groups and two support groups. The Marine Corps Individual Reserve Support Activity is an administrative authority that oversees the Individual Ready Reserve, which consists of individuals who are no longer affiliated with active or reserve units, but who are still under military obligation, and who may be recalled to active service during wartime and times of national crisis.

The bulk of MARFORRES personnel are members of the Ready Reserve, which includes the Selected Marine Corps Reserve, the Active Reserve, Individual Mobilization Augmentees, and the Individual Ready Reserve. Marines from the Selected Marine Corps Reserve are assigned to individual reserve units stationed throughout the United States. Marines from the Active Reserve serve in a variety of full-time reserve billets and provide critically needed duties such as recruitment and administration of personnel. Marines of the Individual Mobilization Augmentees conduct their reserve training with active-duty units. Marines from the Individual Ready Reserve are former regular and reserve personnel who can be recalled to active duty during wartime and in times of national crisis. All Marine reservists, regardless of individual billet, receive the same training and education as active-duty marines.

Following the events of September 11, 2001, MARFORRES served in a variety of combat, contingency, humanitarian, and disaster relief operations throughout the globe. They did this under the auspices of the Department of Defense, the United Nations, and the North Atlantic Treaty Organization. Most prominently, they fulfilled both combat and support roles in Iraq and Afghanistan during Operation Iraqi Freedom and Operation Enduring Freedom. Between September 2001 and March 2009, more than 52,306 reserve Marines were activated, with most (98%) of them deployed to U.S. Central Command's area of operations. The number of Marine reservists operating in Iraq and Afghanistan fluctuated between 2002 and 2010; however, MARFORRES retained a significant presence in both Operation Iraqi Freedom and Operation Enduring Freedom. In 2008, the peak year for the number of U.S. forces serving in Southwest and Central Asia, the Marine Reserves constituted 13% of total Marine Corps forces in-theater. In 2005, the Marine Corps Reserve had the largest number of reservists (10%) serving more than 2 years in support of operations in Iraq, Afghanistan, and elsewhere.

RESERVE, NAVY

The Navy Reserve is the reserve component of the U.S. Navy. This entry discusses the history, mission, and roles of the U.S. Navy Reserve.

Early History

According to the official account of the history and mission of the U.S. Navy Reserve, the roots of the U.S. Naval Reserve can be traced to the use of privateers during the American Revolution. Specifically, the Naval Reserve is said to have begun on June 12, 1775, when the citizens of Machias, Maine, seized the schooner *Unity* and utilized it to engage the British warship HMS *Margaretta*. Building on this early victory, the American Revolutionaries continued to use privateering against Great Britain. In the end, this form of naval warfare represented a principal means used by Americans to achieve independence. Even after the formation of the official Continental Navy, privateers remained a separate force that provided support for the navy, with the result that the line between the fledgling Naval Reserve and the Continental Navy was often blurred. For example, the ship crews of John Paul Jones, one of the most famous naval commanders of the American Revolution, seamlessly moved between being a part of the Continental Navy and privateering, the primary difference between these two spheres being how sailors received their pay and orders. The Continental Navy was under federal ruling; the privateers worked for themselves and received prize money from the American government and opposing British forces. In general, privateers during the American Revolution had very few laws governing their actions.

In the War of 1812, Congress decided to utilize the privateers once again, though with more oversight. This congressional control included issuance of commissions in addition to specific guidelines regarding

behavior at sea. After a year of success in capturing British prizes, Privateer Captain Joshua Barney rejoined the U.S. Navy as a captain and coordinated barges and boats to blockade the Chesapeake Bay as the so-called Chesapeake Bay Flotilla. This action while daring failed to prevent British naval vessels from reaching Washington, D.C., or sailing further up the Chesapeake. Scuttling his vessel to avoid capture, Barney fought with distinction with other sailors on land in the Battle of Blandensburg that prevented the British from seizing Baltimore.

Shortly following the outbreak of the Civil War, President Abraham Lincoln called the navy to defend the Mississippi River against the threat of the Confederacy. The Naval Reservists formed a key part of that force and substantially contributed to the ultimate Union victory. By the end of the war, the Naval Reserves had made their mark: Six naval enlisted men received the Medal of Honor for their support of the *Monitor's* actions against the ironclad CSS *Albermarle*.

After the Civil War, Congress worked toward further professionalization of the naval reserve forces. Senator Washington C. Whitthorne created a bill calling for organizing the “State’s Navy” or naval militias—organization that had already been loosely formed. Even as the process of confirming this bill was under way in 1890, Captain Alfred Thayer Mahan called for modernization of the navy and new organization for its “reserve forces” in his influential book *The Influence of Sea Power Upon History*. The “Naval Reserve” then consisted of an odd mixture of the old privateers and the new state naval militias, and Mahan proposed a more organized and focused naval fighting strategy that embraced both regular and reserve forces. More states subsequently created organized militias, and in 1894, the secretary of the navy gave the militias ships that were no longer needed by the navy.

The Naval Reservists, who still lacked an official title or federal governance, were called on once again in 1898 when America declared war on Spain. A month after the declaration of war, Congress called for an Auxiliary Naval Force that included 4,224 naval militia men to fight against Spain. The war was short-lived, and by 1899, the auxiliary force was disbanded.

Congress, recognizing both the importance of the extra manpower the reservists provided and the need for organization of many different state naval

militias, created in 1911 the Office of Naval Militia. Subsequent passage of the Naval Militia Act in 1914 gave the president power to call the naval militias to service in case of an emergency. Also, for the first time since 1812 Congress looked at the benefits that the naval reservists received and ordered that pay, transportation, and subsistence be provided for enlisted men and pay and mileage for officers. By June 1914, there were 7,728 personnel in the naval militias, consisting of 596 officers and 7,132 enlisted men from a total of 21 states. The institutionalization process culminated with the official establishment of the U.S. Naval Reserve through the Naval Appropriations Act on March 3, 1915. World War I was thus the first major conflict that the Naval Reserve entered into as an official federal organization.

The Official Naval Reserve

The amendment to the National Defense Act on June 3, 1916, created six classes within the U.S. Naval Reserve Force, including the Naval Reserve Force Flying Corp (building on an Aeronautical Reserve established in February 1915), the National Naval Volunteers, and the Marine Corp Reserves. An order by the secretary of the navy Josephus Daniels on March 19, 1917, authorized women to join the Naval Reserves, and the first woman enlisted was Chief Petty Officer Loretta Walsh.

The entry of the United States into World War I led to a surge in reserve enlistment. By December 1, 1917, roughly 60,000 Naval Reservists had been mobilized, and the numbers continued to swell. By the end of World War I in 1918, the Naval Reserves had 290,000 members, including 26,000 in Naval Aviation. As a result of this growth, the government once again reorganized the Naval Reserve. The Naval Reserve Act in 1925 created three new classes: (1) the Fleet Naval Reserve, (2) the Merchant Marine Reserve, and (3) the Volunteer Reserve. In 1926, the Naval Reserve Officer Training Corp was established in six colleges: (1) Harvard, (2) Yale, (3) Georgia Institute of Technology, (4) University of Washington, (5) University of California, and (6) Northwestern University. More than 1,000 students enrolled within the first year.

World War II began in 1939, and by 1941, any Naval Reservist who had not been mobilized was called to active duty. The Naval Reserve served as

active duty until the end of the war in 1945. More than 30,000 reservists were called to active duty at the beginning of the Vietnam War, and an average of 30,000 reservists remained on active duty until the end of that conflict in 1975. Many firsts for the Naval Reserve occurred during this time frame: In 1971, the first fully integrated crew of active-duty personnel and reservists served a 3-month deployment on the USS *Gearing* (DD 710). More than 21,000 Naval Reservists served in Operations Desert Shield and Desert Storm, and reservists also took part in operations in Haiti and the former Yugoslavia in the 1990s.

Distinctive Traditions

In some significant ways, the Naval Reserve differs from its equivalents in other military branches. Traditionally, the navy demonstrated a marked reluctance to use reservists, reflecting the overwhelming dominance of United States Naval Academy graduates in positions of leadership—this trend has begun to change in recent years, however. Also, in contrast to other branches, the navy's peacetime presence has traditionally been much closer to its wartime form, reducing the need for reservists during times of conflict. Finally, when called to service, Naval Reservists do not usually serve as part of an exclusively reserve unit but are placed in individual assignments.

Today's Navy Reserve

The Naval Reserve has served in some capacity in every conflict since the American Revolution. As of 2012, the Navy Reserve has approximately 65,000 members, organized into three modern divisions: (1) Ready Reserve, (2) Stand by Reserve, and (3) Retired Reserve inactive. Modern navy reservists receive a monthly income, health care coverage, and retirement incentives. With all of the changes and transformations that have occurred to create the Navy Reserve known today, its mission remains essentially the same: to provide capabilities and manpower to support the U.S. Navy.

RETIREMENT

Retirement benefits in the military differ from those in the civilian world not only in terms of their relative generosity but also in terms of the functions they perform. Retirement plans in the civilian sector are typically understood to be a form of deferred compensation—one that allows companies to recruit and retain a reliable and experienced work force, to defer some cash payments for wages and salaries, and to reward loyal employees for their work. Military retirement plans fulfill these functions as well. However, unlike in the civilian world, the military retirement system also plays a vital role in regulating the composition of the force, incentivizing long-term service for a core of experienced officers and noncommissioned officers, and at the same time offering a “separation incentive” so that the armed forces do not become top-heavy with older service members.

Historical Development of Military Retirement Systems

Retirement benefits as such were comparatively rare in the ancient and medieval world. Although the largest and most powerful states typically did have some sort of system for rewarding soldiers who performed well in battle or engaged in extended military careers, the early rewards often came in the form of plots of land or shares of plunder. In citizen armies organized along militia lines—for example, those of the early Greek city-states—citizen-soldiers served at their own expense and were expected to be able to support themselves in old age. Soldiers who fought on a mercenary basis were also largely expected to fend for themselves at the end of their careers. In countries with militaries organized along feudal lines, or that possessed dedicated warrior castes—the armies of early-medieval Europe or China, for example—retirement benefits were not

considered necessary. In these countries, feudal landholdings served both as military compensation and as an ongoing source of economic support until the end of the landholder's life.

Systematic retirement benefits appeared with the rise of professional armies. Career soldiers in the Roman Imperial army were given land grants and monetary pensions to support their postsoldiering years, and the Roman system eventually evolved to support these benefits with a dedicated stream of tax revenue. However, provision for short-term soldiers, or for those serving in armies less thoroughly professionalized than the Roman army, could be considerably less generous. The earliest pensions were often awarded solely to individuals who were disabled in battle, or to the widows and orphans of soldiers killed in battle, as was the case in ancient Athens. Many veterans of early-modern European armies were sent to monasteries to subsist on religious charity or were granted nothing more than an official license to beg. As a result, many older soldiers refused to retire until it was absolutely necessary, remaining in the ranks until they were physically unable to serve. Others, forced into civilian life without any retirement provision, became bandits or petty thieves.

Retirement benefits became more widespread and systematic as the modern nation-state became the dominant form of international organization. In 1674, Louis XIV of France founded the *Hôtel des Invalides*, which not only pioneered early social provision for military veterans but also had the ancillary benefit of helping regulate their behavior. He also established a regular pension system and other forms of social provision for aged and disabled veterans, as did other states like Prussia and England. As the modern nation-state became increasingly democratic, provisions for military retirement became more generous, reflecting the increasingly close relationship between soldiers and the states they served.

Retirement Benefits in U.S. Armed Forces

The current system for members of the U.S. armed forces who reach retirement age is far more generous than the retirement plans offered by many companies in the civilian sector, and it arguably offers some of the best military retirement benefits anywhere in the world. The United States allows individuals to retire after 20 years of active service,

regardless of age, and offers retirement payments on a noncontributory defined-benefit basis. In addition to cash payments, military retirees receive a variety of nonmonetary benefits, including heavily subsidized medical care, shopping privileges at military commissaries and exchanges, and the right to use military recreation facilities. Dependents of military retirees—spouses and minor children—also may receive monetary and nonmonetary benefits after the retiree's death.

American military personnel become eligible to receive retirement benefits after a minimum of 20 years of service. Those who retire after longer periods of service may be eligible for more generous cash payments, but those who serve less than 20 years receive no retirement benefits at all, except for those who are medically retired. Active-duty retirees can begin receiving their retirement payments immediately on leaving the service. The typical enlisted retiree from the U.S. armed forces is 42 years of age and has completed 21 years in military service, and the typical officer retiree is around 46 years old and has completed roughly 23 years of service. (Reservists, in contrast, may not collect payments until they reach 60 years of age.) Individuals who are medically retired are allowed to receive retirement benefits irrespective of age or the length of time spent on active duty. Retirement pay in the U.S. military is legally and administratively considered to be reduced pay for reduced service and is handled by the Department of Defense rather than the Department of Veterans Affairs. Military retirees, except those who have been medically retired, remain on an inactive reserve list and can be called up for duty in the event of a war or a national emergency. In practice, however, call-ups of military retirees are rare, and call-ups in peacetime or after 5 years of retirement are virtually nonexistent. The exact amount of retirement pay varies according to a variety of factors, the most important of which are the individual's length of service, his or her basic pay at the time of retirement, and his or her date of entry into the U.S. armed forces. Because basic pay itself varies by rank and length of service, these are also important indirect factors in the amount of retirement pay.

There are three basic systems of retirement pay currently in effect for the U.S. armed forces: the Final Pay system, the High-3 system, and the Redux or Two-Tier system.

Final Pay System

The Final Pay system only applies to service members and retirees who entered military service prior to September 8, 1980. For these individuals, retirement benefits are determined by multiplying basic pay at the time of retirement (called the *computation base*) by a retirement multiplier ($2.5\% \times \text{Number of years of service}$). Under the Final Pay system, retirees who have served 20 years receive 50% of their basic pay as a retirement benefit, and individuals who have served more than 20 years receive payments that are correspondingly larger—approximately 63% of the computation base for retirees with 25 years of service and 75% of the computation base for those with 30 years of service.

High-3 System

Personnel who entered the military after September 8, 1980, but before August 1, 1986, are governed by the High-3 System. Under the High-3 system, the computation base is the mean of the top 3 years of one's base salary, rather than the final base salary as in the Final Pay system. All other calculations are the same.

Redux or Two-Tier System

Individuals who entered service on or after August 1, 1986, which includes the bulk of the current force, can choose between the High-3 system and a third system, commonly called the *Redux* or *Two-Tier* system. Individuals who retire under Redux receive a \$30,000 bonus after 15 years of service. After leaving the service, and before reaching the age of 62, they receive retirement payments that are somewhat smaller than payments under the High-3 system, although the difference is less pronounced for retirees whose length of service approaches 30 years. Payments for retirees older than 62, or who have completed 30 years of service, are approximately equal to payments for retirees under the High-3 System. Although the Redux retirement system has been heavily criticized—and was ultimately made optional as a result of this criticism—the major advantage of the Redux system is the \$30,000 bonus that service members may take relatively early in their lives. (An individual who enters the service at age 19, for example, would receive the bonus before age 35.) For individuals with sufficient business or investment knowledge,

or who are able to complete 30-year careers, this bonus can be a valuable retirement asset. Individuals who leave before they complete 30 years of service, or who do not invest the bonus, may find the Redux option to be less financially advantageous.

Medical Retirement

Individuals who are medically retired may choose to receive payments calculated one of two ways: (1) under the applicable nondisability retirement option or (2) by multiplying the individual's base pay by his or her rated disability percentage.

Reserve Personnel

The retirement system for reservists shares many characteristics with the active-duty retirement system. As with active-duty personnel, reserve personnel can earn retirement benefits with 20 years of service, and benefits for reservists are calculated with either the High-3 or Final Pay system. There are, however, some important differences. Reservists are ineligible for retirement under the Redux system, and reserve personnel begin receiving benefits at age 60, rather than immediately on leaving the service, as active-duty personnel do. In addition, qualifying years in the reserves are defined differently than in the active service, depending not just on time served but on a complex points system that accounts for the reservist's level of activity. Finally, it is important to note that reserve retirement benefits are roughly proportional to reserve salaries and that retirement payments for reservists—though generous for the limited time commitment required during peacetime training—are not financially comparable with active-duty retirement payments.

The key difference between the way that active-duty and reserve retirement benefits are calculated is that a qualifying year in the reserve component is defined as a calendar year in which service member earns at least 50 retirement points. These points can be earned in several different ways: (a) by completing a period of reserve training (a "drill"), (b) by spending time on active duty for training or deployment purposes, (c) by completing authorized military correspondence courses, or (d) by volunteering for military funeral details. The number of points earned is crucial in establishing both the quantity of time spent in qualifying duty and the total of "equivalent years of service" for computing retiree compensation.

Current Issues in U.S. Military Retirement

Military retirement benefits are a significant portion of the U.S. defense budget, and many critics argue that current levels of retirement benefits are unsustainable over the long term. They note that military retirement benefits are in many ways more generous than those in the civilian sector and that retirees often collect retirement benefits for longer than the time that they spend on active duty. (In the United States, roughly 2 million individuals collect retirement pay, and millions more collect some type of benefit, from an annual expenditure of roughly 50 billion dollars per year.) In addition, these critics suggest that the current retirement system offers little provision for service members who are separated after 10 or 15 years of service. However, proposed change to the military retirement system faces close scrutiny from members of Congress, veterans' groups, and current service members, as well as analysts who point out the important personnel management role played by the current retirement system.

ROTC

The Reserve Officers' Training Corps (ROTC) program offers college students scholarships and stipends in exchange for their service as officers in the American military. ROTC began in 1916 as part

of the pre-World War I Preparedness movement; it then underwent fundamental changes at the start of the Cold War. Once a program designed to give young men a basic introduction to military service so that they might be able to serve in the military in the event of war or other national crisis, ROTC became instead an essential source of active-duty officers for the growing Cold War military. Two years of ROTC were required for men at most universities that hosted the program, but the expense of training thousands of men who would not complete the 4 years required for a commission led to the program becoming voluntary in the early 1960s. ROTC also disestablished units at many liberal arts colleges that were too small to justify the costs. This entry discusses the history and makeup of ROTC, before and after the formation of the all-volunteer force (AVF).

ROTC and the Vietnam War

ROTC's advocates have argued that the program exposes future American officers to a civilian education, thus preventing the American officer corps from developing into a separate caste within American society. They have also claimed that ROTC cadets took a wider variety of courses and received a better education than their peers from the service academies. Critics, especially during the Vietnam War period, have argued that ROTC's discipline, use of weapons, and professional curriculum have no place within the civilian university system. The most radical anti-ROTC protestors claimed that ROTC made universities complicit in training killers for an immoral war in Vietnam. Thus, ROTC units become targets for campus protests at the height of the antiwar movement of the 1960s and 1970s.

The Vietnam War period brought changes to ROTC, but these changes should not be overstated. Most university administrators, students, and faculty supported ROTC's presence as a voluntary program on college campuses, even though many of those same people also opposed the war itself. For many members of the faculty, ROTC offered a critical way for civilian faculty to influence the subjects that future officers studied. Simply removing ROTC from campus and turning the education of officers exclusively to the military struck them as extremely unwise. Students generally opposed mandatory ROTC and disliked the appearance of weapons on

campus, but they supported ROTC's continuance as a career option for those who chose it. The Vietnam War thus led to significant reform to ROTC, but the vast majority of people in positions of power within the military and higher education continued to support the existence of the program.

The Vietnam War and associated campus protests led to curricular and structural reforms to the program, but the real impetus for ROTC change came from the end of the draft and the beginning of the AVF. During the era of the draft, many men had used ROTC to control the timing and nature of their military service. As long as a young man remained enrolled in school and ROTC, he could defer his military service. Thus, young men in the 1960s often signed up for ROTC hoping that the war in Vietnam might end before they graduated. Others signed up for the navy or the air force ROTC programs to avoid being drafted as an enlisted man in the army. ROTC saw immediate and steep drops in enrollments in 1969 when the Selective Service System ended student exemptions and assigned each man a random number. Thereafter men with high draft numbers left the program in droves because they had no need of ROTC to protect them from military service.

ROTC and the All-Volunteer Armed Forces

The AVF's implementation in 1973 meant that young men would thereafter only join ROTC as pure volunteers rather than as refugees from conscription. Consequently, ROTC enrollments fell once again. Army ROTC enrollments plummeted from 141,495 in the academic year 1967–1968 to just 38,228 in the academic year 1974–1975. In the same period, air force ROTC enrollments fell from 44,987 to 15,993, and navy ROTC enrollments fell from 9,443 to 6,546. These drops threatened the viability of ROTC programs nationwide and led to calls for the military to abandon the program altogether in favor of off-campus Officer Training Schools and Officer Candidate Programs.

ROTC's problems mirrored those of the AVF more generally. Without the Damoclean sword of conscription hanging over their heads, too few young men volunteered for military service. ROTC's fate was tied to the larger AVF, which began to see a revival in the late 1970s and early 1980s as the military improved the pay, benefits, and living conditions

of military service. American society also showed a new respect for military service as a profession as the passions of the Vietnam War era began to recede. A new generation of college students, more career focused and less impassioned by the war, also made ROTC's place on campus more comfortable. For their part, ROTC units reduced the military-style discipline, the on-campus marches and parades, and even the haircut requirements to make their students stand out less from their non-ROTC peers. In this vein, the University of Connecticut successfully petitioned the army to remove an ROTC commander in the mid-1990s for, strangely enough, allowing classes to be run "like a boot camp."

ROTC's curriculum changed as well. The military moved purely professional courses like weapons training and map reading to off-campus summer programs. On many campuses, students substituted for those courses civilian classes on subjects like political theory, non-Western culture, and literature. Many campuses also ended the teaching of subjects like military history by ROTC instructors, demanding instead that students take those classes from civilian professors. ROTC programs often came under the authority of one of a university's colleges, thus subjecting them to curriculum review and a closer scrutiny over the qualifications of their faculty. As a result, the number of ROTC instructors with master's degrees rose sharply. By the 1980s, a master's degree became a requirement for an assignment as an ROTC instructor.

ROTC also reached out to groups of students it had previously marginalized. The most important groups were the same people who were making the AVF work: African Americans, Hispanics, and women. ROTC offered people from these groups access to the officer corps that had previously been difficult for them to attain. The armed services opened new ROTC units at historically Black colleges and universities and made great efforts to assign African American officers to ROTC units at schools with growing minority populations. They also reached out to women, who were showing an unanticipated interest in the AVF and military service more generally. In the late 1970s, the military recognized this interest by disbanding the separate female auxiliaries (the Women's Army Corps, the Woman in the Air Force, and the Woman Accepted for Volunteer Emergency Service) and integrating women more fully into the military's noncombat arms. By 1980,

more than 4,000 women were in ROTC programs nationwide, and the numbers continued to grow. Today, one in five ROTC cadets is a female.

ROTC also made an effort to attract more working-class students, in large part because middle-class students were showing little interest in military service. The services closed many of their units in the Ivy League and at liberal arts colleges in favor of branch campuses of public universities in the South and Midwest. Between 1968 and 1974, the services closed 88 ROTC units, almost half of them in the Northeast. At the same time, they opened 80 new units, 45 of which were in the South. As the costs of college grew, ROTC became more attractive to men and women who saw the program as a way to afford higher education. A 2-year ROTC program aimed at attracting men and women who had transferred from the growing number of American junior colleges. Working-class students, women, and African Americans also made up increasingly large percentages of university populations nationwide. Thus, ROTC was following the general trend in higher education.

These changes solved ROTC's enrollment problems. From the academic year 1975–1976 to 1980–1981, total ROTC enrollments steadily increased from 65,968 to 99,659. Enrollments continued to rise through the 1980s as the Reagan administration increased expenditures on the military and as the reputation of the military continued to recover from the Vietnam era. Additionally, college tuition and costs rose sharply during the decade, making ROTC more attractive for young men and women who sought financial aid options other than loans. The armed services also advertised and marketed ROTC as a means for gaining access to high-paying jobs after the mandatory military service period (usually 3–5 years, depending on the program) was over.

Current Trends

As a result, ROTC recovered from the depths of the problems it had faced in the late 1960s and early 1970s. Army ROTC now accounts for 60% of newly commissioned army officers and more than half of the total army officer corps. Air Force ROTC provides a little less than half of the officers for that service. The navy, which has always focused less on ROTC than the other services, nevertheless accesses one in five of its officers from ROTC. ROTC today is found on 273 campuses and has cross-enrollment

agreements with 1,100 more. These agreements allow students from non-ROTC host schools to take ROTC training at nearby host schools.

Although ROTC has avoided large-scale campus protests since the end of the Vietnam era, it has not been immune from controversy. Critics of the Department of Defense's "Don't Ask, Don't Tell" policy argued that barring openly gay men and women from serving in the military (and by extension in ROTC programs) violates the equal opportunity policies of civilian colleges and universities. Most schools dealt with this problem by forging compromises whereby university policies apply to ROTC cadets as long as they remain students. On graduation, of course, the newly commissioned officers were subject to the Uniform Code of Military Justice. These compromises helped ROTC retain its presence on most campuses, diffusing the isolated protests that appeared on some campuses in the mid-1990s.

More recently, ROTC programs have avoided the kinds of antiwar protests that were common during the Vietnam period. Although some critics continue to argue that the civilian university system should not assist in the training of officers for wars, student protest against ROTC has been virtually nonexistent. In large part, the absence of protest can be explained by the lower level of societal protest against the wars in Iraq and Afghanistan, but ROTC is also a different program than it was in the 1960s. Now part of a volunteer military, it only bears a connection to war for those who actively choose to enroll in it. The age of the "draft-motivated volunteer" who, paradoxically, enrolled in ROTC to *avoid* being sent to war is now over.

The highly visible rise to prominence of a number of ROTC-trained officers has helped remove the second-class stigma once associated with the program inside the armed services. Foremost among these senior officers was ROTC graduate Colin Powell, but the rise to senior rank of others like Air Force Chief of Staff General Richard Myers and Army Chief of Staff General George W. Casey have been important as well. ROTC is today a recognized and established part of both the military's officer accession programs and the daily life of many college campuses.

ROTC, Jr.

In high schools across the United States, young student cadets fill the ranks of the Junior Reserve Officers' Training Corps (JROTC). Despite their stated virtues, the growth of these JROTC programs, sponsored by the U.S. Army, Navy, Marine Corps, and Air Force, have triggered a polarized debate over military recruitment of America's middle school and high school students. This entry describes the evolution of the Junior Reserve Officers' Training Corps and the debate over the efficacy and proliferation of thousands of JROTC programs in schools across the United States.

Legislative Foundation

First conceived in 1911 by Army Lieutenant Edgar A. Steevers, the JROTC program officially began in 1916 as a means to increase military readiness during World War I. The National Defense Act of 1916 authorized army ROTC for colleges and university as well as army JROTC for high schools. The law also dedicated defense funds for uniforms, equipment, and salaries for instructors. The National Defense Cadet Corps also emerged as an alternative without federal funding. After World War II,

Defense Secretary Robert S. McNamara cut the floundering JROTC's budget in 1963 only to have Congress revive the program in the ROTC Vitalization Act of 1964. The legislation officially opened JROTCs and ROTCs to the U.S. Navy, Marine Corps, Air Force, and Coast Guard and began to replace active-duty instructors with retirees.

Under law, JROTC programs are intended "to instill in students in United States secondary educational institutions the values of citizenship, service to the United States, and personal responsibility and a sense of accomplishment" (<http://www.cadetcom.mand.army.mil/jrotc-history.aspx>). Additionally, Title 10 of the U.S. Code, Section 2031, further outlines JROTC's basic structure and operations. The federal government subsidizes uniforms, equipment, and textbooks and shares 50% of the instructors' salaries with local school districts. Each instructor receives a salary equivalent to active-duty pay. Students who successfully complete the 3- to 4-year JROTC programs earn the privilege of enlisting at slightly higher pay grades. Each service branch has designed its own unique curriculum around this framework.

JROTC Growth and Opposition

Offered as an elective in more than 3,000 schools across the United States, JROTC programs boast unique, service-specific curriculum with a unifying emphasis on discipline and leadership. Each service's JROTC offers a range of specialties and activities from marksmanship teams, orienteering, and rocketry to coursework on military, aviation, or naval sciences. Every JROTC program focuses on self-discipline and leadership developed through coursework, physical fitness, and opportunities in the corps' hierarchy for cadets to lead their peers. Moreover, some JROTC cadets have the opportunity to participate in regional and national competitions on marksmanship teams, color guards, and drill squads. Many cadets also participate in organized trips to overnight and summer camps as well as historical, political, and military sites both in the United States and abroad. Outside of school, the programs devote numerous hours to community service projects ranging from food banks and Habitat for Humanity to the Marine Corps's Toys for Tots. Although JROTC has no service obligation, cadets interested in pursuing a military career or college have scholarship opportunities for future studies.

Throughout the 1990s, JROTC programs flourished across the country and particularly in urban public school districts. Proponents argued that JROTC programs could provide stability and direction for inner-city youth who may otherwise find themselves mixed up with gangs and drugs. By 2005, the number of JROTC programs had more than doubled from 1,493 in 1990 to 3,184 in high schools, with the cadet population exploding from 216,000 to more than 500,000 in the same period. As units' caps increased, growth ultimately hinged on Defense Department funding, even though funding had grown from \$65 million per year in 1990 to \$293 million in 2005. In 2012, the nationwide JROTC programs received more than \$391 million, including \$73 million for personnel. That same year, Chicago, like many other urban school districts, had become a JROTC stronghold with 44 high school programs, including 7 military academies and 12 other Middle School Cadet Corps programs. Dramatic demand for the program not only resulted in waiting lists but also a struggle to find qualified instructors.

As JROTC began to boom in the 1990s, opposition to its growth also increased. Antiwar organizations, including the Central Committee for Conscientious Objectors and Veterans for Peace, oppose JROTC over concerns about curriculum quality, the glorification of war, and dubious recruiting practices. Although Title 32 of the Code of Federal Regulations, Section 542.5, restricts direct recruitment by JROTC programs, it also charges the programs with raising awareness for military careers. In 2000, the Joint Chiefs of Staff defended increased JROTC budgets before the House of Representatives' Armed Services Committee. Their testimony indicated that between 30% and 50% of JROTC cadets continue into the military either through college ROTC or by enlistment after graduation. Further opposition surrounds Middle School Cadet Corps who enroll as early as sixth grade and Section 9528 of the No Child Left Behind Act of 2001, which provided the military with access to high school student information that culminated in a recruiting database of 30 million names.

JROTC's Future

As JROTC continues to grow, both supporters and opponents will watch in anticipation of its future

successes and failures. Decades of the unprecedented growth of JROTC still await a verdict on how successfully it has contributed to the mission of uplifting troubled inner-city youths. The justification of the costs to local school districts will hinge on this promise as well as JROTC's future as a viable alternative to more traditional extracurricular activities. Despite their differences, all sides will undoubtedly hope for a brighter future for all students seeking the American Dream.

RULES OF ENGAGEMENT

Rules of engagement (ROE) are guidelines to help commanders minimize unnecessary collateral damage while protecting their inherent right of self-defense during operations. Theater and operational ROE are derived from standing ROE issued by the Joint Chiefs of Staff and limitations described by the National Command Authority. The mission, enemy threat, and host nation constraints also contribute to development of the ROE. Once approved, ROE are printed and issued to subordinate commands. In most cases, every soldier carries a copy. The basic tenets of ROE are that they should be easy to read and understand and that they must clearly indicate the circumstances under which soldiers may use deadly force to defend themselves and achieve mission success. This entry looks at the evolution of ROE in the U.S. military and current debates.

Background of Rules of Engagement

ROE are based on the laws of land warfare but vary by mission and location. The U.S. military

began to emphasize the need for understanding and training in the ROE following the Vietnam War. Ground troops increasingly had difficulty identifying an elusive enemy as the war dragged on, and war crimes like My Lai created the perception that soldiers lacked rules for interacting with civilians during operations. The Defense Department developed doctrinal laws of warfare based on The Hague and Geneva Conventions. The U.S. military issued standard ROE to provide guidance for all operations both inside and outside the continental United States, which are a distilled version of that doctrine. By 1991, judge advocates were firmly entrenched as staff advisors to senior commanders and war planners to provide expertise in the laws of war and to draft ROE for specific theaters.

The intent of all ROE is to provide clear guidance to soldiers, but there is an inherent tension between the two goals of ROE. Rules that are too lax can result in unnecessary collateral damage, including civilian deaths. An example is the case of James Mowris, a soldier who served in Somalia in 1993. During a patrol, his platoon searched a small village and found several munitions. The platoon questioned a villager and several minutes later two men ran away from the village. The platoon chased the men, and a short time later, Mowris shot and killed one of them. The ROE Mowris operated under were vague and covered five typed pages. Soldiers of all ranks during the investigation admitted that the ROE were unclear to them.

Conversely, rules that are too strict can limit soldier initiative and cause damage to friendly forces. The 1983 Beirut barracks bombing resulted in the deaths of 241 marines and sailors. Marine sentries failed to engage a truck that smashed through the fence surrounding their compound. The truck crashed into a barracks building and detonated a large amount of explosives. The failure of the sentries to engage the truck prior to detonation resulted from confusion about the ROE. Each marine carried two ROE cards that conflicted with the compound commander's orders for force protection posture. The ROE required sentries to carry loaded magazines, while the force protection orders required personnel on the compound to carry unloaded magazines. As a result, the sentries had unloaded weapons and were unable to engage the truck.

Surviving marines help lift wounded Morris Dorsey out of the rubble after a Mercedes truck loaded with explosives plowed into the headquarters building where they were all still sleeping at 6 a.m., October 1, 1983.

ROE are not limited to ground operations. The constraints inherent in ROE also affect air operations. While ROE are based on the laws of land warfare, political considerations might also influence their level of restriction. Pilots in Operation Rolling Thunder during the Vietnam War operated under strict ROE that prevented them from bombing some targets even though the law of land warfare recognized them as legitimate targets. The restrictions resulted from the political desire to keep the war limited and prevent direct intervention from China or the Soviet Union. Conversely, pilots operated under less restrictive ROE during the 1991 Persian Gulf War and were immensely successful in engaging

their selected targets. Their success was due in part to greater political will derived from the legitimacy of a multinational coalition but was also due to the level of education and training with ROE and the involvement of legal specialists in drafting them.

Rules of Engagement in the 21st Century

ROE continue to be an important issue in the current counterinsurgency wars because of the inherent tension between its two primary goals. In 2009, General Stanley McChrystal ignited a sharp debate over ROE when he announced more restrictive rules after assuming responsibility for the war in Afghanistan. Critics argued that this decision endangered American soldiers, while proponents argued that the new rules would help meet strategic objectives by reducing the amount of noncombatant deaths and property damage. General David Petraeus stoked the fires of debate when he assumed responsibility for the war in 2010 and announced he would not change the previous policy.

Incidents like the abuse of prisoners at Abu Ghraib and the killing of Iraqi civilians by U.S. troops in Haditha highlight the continued need for clear, easily understood ROE. To prevent incidents like these, the military now integrates ROE into all levels of training. Officers receive classroom briefings from military lawyers on the laws of land warfare prior to deploying, while soldiers receive briefings specific to the theater of operations and geared toward tactical operations. From this basis, both officers and enlisted personnel are trained on ROE through tactical problems. Units face a variety of tactical situations that require a working knowledge of ROE. Observers evaluate unit performance and lead discussion in after-action reviews. In this way, soldiers integrate ROE into everyday operations in a meaningful way.

The U.S. military has a cultural aversion to limiting initiative on the battlefield, which acts against ROE becoming overly restrictive. The instant information age, however, has pushed many commanders toward more restrictive measures. Any incident that occurs on the battlefield can be broadcast around the world within hours and instantly shape public perception. Public perception influences policy, which, in turn, has a direct effect on military operations. Therefore, commanders are pressured to adopt more restrictive ROE to avoid unwanted negative attention. An investigation is usually conducted after

Military police from 10th Mountain 10th MP Company 2nd Platoon conduct a presence patrol in the area around Orgun-E. These patrols reduce the likelihood of the Taliban establishing an area of operation in this vicinity. Sergeant C. J. Krueser, Squad Leader, and Sergeant Darian Tobias, B Team Leader, take notes as the Platoon Leader addresses the platoon prior to the patrol. He is going over the route, ROE, and other information to ensure that his platoon is ready for the mission.

any ROE incident to determine if the rules need to be changed. It is likely that this debate will continue to pervade military and political discussion as the U.S. military believes that low-intensity conflict will dominate operations in the decades to come.

RUMSFELD, DONALD

Donald Rumsfeld (b. 1932) served as the youngest secretary of defense (1975–1977) and also the oldest (2001–2006). His first tenure, under President Gerald R. Ford, was uneventful; his second, under President George W. Bush, proved to rank along with that of Robert McNamara (1961–1968) as the most vilified of any secretary of defense. This entry examines the career and policies of Donald Rumsfeld.

Rumsfeld attended Princeton University, where his relentless drive found its outlet in the wrestling team. He was a naval aviator (1954–1957), seeing

no combat. He came to Washington as a congressional aide, winning his own seat in Congress in 1962 from a solidly Republican district in the Chicago suburbs. In 1969, he left Congress to become a senior aide to President Richard M. Nixon, gaining cabinet rank while avoiding the scandals of the era. After a year as ambassador to the North Atlantic Treaty Organization, he was recalled by his old House colleague President Gerald Ford to be White House chief of staff (1974–1975), then secretary of defense. His most difficult challenge was rebuilding a military dispirited by the fiasco in Vietnam and anxious about the end of the draft. He worried that the Soviets were surpassing the United States in nuclear weaponry, so he sought to undermine the détente policy of Ford and Secretary of State Henry Kissinger. Rumsfeld's logic was to assume the worst-case scenario, not the most likely scenario, and react accordingly; in dealing with Iraq in 2003, he reversed course and assumed a best-case scenario.

After Ford's defeat in 1976, Rumsfeld became a highly successful chief executive of a major drug company and then moved to electronics where his firm pioneered high-definition television technology. All the while, Rumsfeld served on numerous national policy committees, and he seriously considered running for president. He could raise money and organize, but he lacked name recognition, charisma, and a distinctive political base.

In his second tour at the Pentagon, Rumsfeld became a media star thanks to his accessibility to reporters looking for colorful sound bites; public opinion responded enthusiastically to his wit and his determination to radically reform military readiness. Rumsfeld brought in his own team of neo-conservative civilians, led by Deputy Secretary Paul Wolfowitz and Under Secretary for Defense Policy Douglas Feith. They ignored the advice of the generals, who grew angrier and angrier. The secretary's response was to build his own base of support in Congress and the White House, where his close friend Vice President Dick Cheney had a powerful voice in setting policy. The attacks on September 11, 2001, provided them with the excuse that the strategic environment had radically changed. America's enemy was now terrorism, not a powerful nation-state, and a new approach was urgently needed regardless of the resistance of reactionaries still rooted in the Cold War against the Soviet Union. Rumsfeld rejected the "Powell Doctrine" that called

for overwhelming force shaped by explicit political goals and a specific exit strategy. He promulgated the "Rumsfeld Doctrine" with a reliance on high technology, special operations, and a quite small but highly maneuverable ground force. Looking for more bang for the buck, his inspiration came not from military history but from his own business experience. He told the nation in 2002, "We must promote a more entrepreneurial approach: one that encourages people to be proactive, not reactive, and to behave less like bureaucrats and more like venture capitalists" (Devji, 2008, p. 150). The career military officers had a very different set of loyalties that were internally motivated and could not be reprogrammed by outside politicians or ideologues.

General Eric Shinseki, the army chief of staff, told Congress that the army needed far more troops to pacify Iraq in 2003 than Rumsfeld would allow. Arguing that the army was stretched too thin, he rejected Rumsfeld's plan to demobilize two divisions and, instead, asked for two more divisions to carry out its assignments, and told Congress the army needed the Crusader artillery system. Shinseki was proven right, but he was ignored on Iraq, and the Crusader was canceled. While Rumsfeld did not make tactical decisions about Iraq, his civilian team single-handedly made all the strategic decisions as well as critical manpower allocations. Generals anonymously drew unflattering comparisons with McNamara and his whiz kids who mismanaged the Vietnam War.

Rumsfeld's most serious mistakes involved the rejection of the military's estimates of the force levels needed after the overthrow of Saddam Hussein and his misjudgment of the probability of a large-scale Sunni insurgency with Iranian involvement. Furthermore, his disbanding of the Iraqi army created a vacuum that insurgents rushed to fill. The result was that American, Iraqi, and Allied forces were badly mauled for years; public opinion turned sour, the media became hostile, and the allies turned away. Rumsfeld refused to listen to the generals and the State Department, even after stunning surprises in Iraq and Afghanistan that belied the premises of his strategy. The generals resisted, but he flooded the Pentagon with 100 e-mails a day, while his energetic, loyal civilian staff meticulously checked to see that his policies were enforced. In areas where the military was overstretched, Rumsfeld hired scores of private contractors, such as Blackwater, to provide

bodyguards, security for installations, and training for Iraq's fledgling army and police. The training was far too little, too late, as Iraq seemed unable to handle its own internal security.

Rumsfeld never lost the support of Bush and Cheney and clung to his course even as he lost his base in public opinion. He lost out in Congress as Democrats made the war a major campaign issue in 2006, and especially as Senator John McCain demanded a new policy that would rely on a "surge" of much larger numbers of infantry in Iraq. Rumsfeld was forced from office as Republicans lost control of Congress in 2006. The surge was then implemented by his successor Robert Gates, and it proved successful. In a broader perspective, the Rumsfeld Doctrine was the military dimension of a new approach to the Middle East—one that replaced the goal of stability with the notion of transforming the region into modern democracies of the sort that do not go to war with one another. That dream of democracy in the Middle East faded out along with Rumsfeld's reputation.

RUSSIA

The Russian Federation spans the Eurasian land-mass with the Ural Mountains accepted as the dividing line between Europe and Asia. The capital

of Russia is Moscow. The country's population, which has been showing a steady decline, in July 2009 was estimated at 140,041,247, the 10th most populous country in the world. Formally considered a federal democracy with a parliamentary-style legislature headed by a prime minister and a president as head of state, in reality the Russian Federation has been in an extended era of uncertain political and economic transition from a Marxist socialist dictatorship toward a democratic market economy without showing signs of imminent success in either the political or economic realms. This entry discusses Russia's armed forces and military personnel, civil-military relations, and border issues.

Armed Forces

The president is the commander in chief of the armed forces, but the minister of defense oversees the day-to-day running of the armed forces. The leadership of the ministry of defense consists of the minister, three first-deputy ministers, six deputy ministers, and a chief military inspector. It is the norm for all of these positions to be held by uniformed officers. The General Staff manages operational control of the six services of the armed forces: (1) the ground forces, (2) the navy, (3) the air force, (4) the space forces, (5) the airborne troops, and (6) the strategic rocket forces. The ground forces are divided into the four branches of (1) motorized rifle troops, (2) tank troops, (3) artillery and rocket forces, and (4) army aviation. In 2006, they numbered 321,000 officers and soldiers, organized into 29 divisions. The army is equipped with 22,000 tanks, 26,000 armored fighting vehicles, 20,000 artillery pieces, and 1,700 helicopters, not all of which it can man. In comparison, the U.S. Army has 547,000 personnel and 10 divisions.

The Russian navy is less than half the size of the ground forces and contains nuclear submarines, aircraft carriers, and surface ships armed with guided missiles. It is divided into six organizational entities: (1) the Northern Fleet, (2) the Black Sea Fleet, (3) the Baltic Fleet, and (4) the Caspian Flotilla, (5) naval aviation, and (6) naval infantry. It is currently in the midst of an ambitious rebuilding program that focuses on almost completely replacing and upgrading the surface fleet and reducing the submarine forces.

RSF cruiser *Moskva*.

Source: North Atlantic Treaty Organization Photo, Alan Burns.

The Russian air force is divided into three branches: (1) long-range aviation, (2) military transport aviation, and (3) tactical aviation/air defense. After more than a decade of stagnation, aviation research and development are now back on track and hope to deliver new models of fighters and bombers in the coming years, though economic problems could significantly delay the process.

After the collapse of the USSR, the Soviet space program was assigned to the ministry of defense as a separate branch. In addition to research and exploration of space, the space forces have both offensive and defensive military missions—to provide satellite guidance of cruise missiles launched against enemies and to provide early warning when enemy missiles are launched against Russia. It also operates surveillance satellites to gather intelligence on Russia's foes and communications and global positioning satellites for the armed forces and government.

The airborne forces, which include airborne divisions and *Spetsnaz* (commando-type) units, operate as a separate branch of the armed forces. A much smaller

branch than the ground forces, they are intended for special operations against foreign armies, governments, and to counter foreign and domestic terrorists.

The strategic rocket forces branch is divided into (1) the strategic missiles forces, (2) the military space forces, and (3) the space missile defense forces. The missile forces are further subdivided into those employing (1) ground-based intercontinental ballistic missiles, (2) intermediate-range missiles, and (3) medium-range nuclear missiles. The posture of Russia's nuclear force has officially been declared to be defensive and deterrent.

Military Personnel

The armed forces are manned by a mixed manning system—that of conscription and voluntary enlistment. Russian males register for the draft at age 17 and can then be conscripted between the ages of 18 and 27. The current period of service obligation is 1 year on active duty and then a reserve obligation until age 50. In 2006, 30% of Russian servicemen were volunteers serving under contract, and the armed forces hope to eventually increase that percentage to 70%, concentrating the volunteers in the airborne divisions and naval infantry regiments. To attract volunteers for the contract system, the armed forces plan on raising pay, living standards, and benefits for families of service personnel. Hazing is still a problem in the Russian army, a holdover from Soviet days, and it is seen as being responsible for the reluctance of many men to serve and the active seeking out of deferments and exemptions by a significant portion of the draft pool. Currently, because of the liberal nature of conscription laws, 90% of eligible males avoid service, which has been used as justification to enhance recruiting through the voluntary contract system. The declining birth rate also poses long-term problems for maintaining the forces. Women are accepted for service on a volunteer basis.

In 2009, the Russian armed forces were the fifth largest in the world, numbering 1.037 million men and women compared with the U.S. armed forces, which were second largest in the world with 1.325 million personnel. The Russian armed forces claim to possess 2.4 million reservists; however, there is no organized reserve force. The reserves comprise former servicemen subject to recall in time of national emergency. There are also no corresponding forces equivalent to the U.S. Army National Guard, the

RFS frigate *Pytlivii* and cruiser *Moskva*.

Source: North Atlantic Treaty Organization Photo, Alan Burns.

Navy and Marine Corps Reserves, and the Air National Guard. Quick and efficient mobilization in time of crisis will therefore remain problematic, as it has been since czarist times.

Civil-Military Relations

In 2006, Russia's defense spending amounted to the equivalent of \$40.3 billion, which was 4.3% of Russia's gross domestic product. Russia ranked 30th in the world in expenditures in 2005. In comparison, the defense spending of United States in 2009 was 4.06% of the gross domestic product, and it ranked first in the world in total dollar value of spending. Given Russia's anemic economy, based primarily in the export of commodities, particularly oil and natural gas, and bleak prospects for significant growth in the near future, the budgetary means available to the Russian armed forces suggest that its ambitious

rearmament plans will take much longer than publicly announced.

Civil-military relations vastly improved with the appointment of Vladimir Putin to succeed Boris Yeltsin as Russian president in 2000. Putin reversed the decline in military budgets, promised a reinvigoration of the armed forces, and adopted a hard-nosed diplomatic position against the West, all of which pleased the military. He worked to improve the public image of the armed forces and reinstituted military parades through Red Square. The president appoints the minister of defense, thereby guaranteeing a cooperative and compliant relationship. Putin has also personally ingratiated himself with the General Staff and leading military figures.

Russia's armed forces are geared to engage in armed conflict on various levels, including local wars on and within its borders, regional wars in conjunction with and against several neighboring states, and

large-scale wars of international coalitions. They plan to be capable of conducting two local conflicts simultaneously. The military is also prepared to participate in international peacekeeping operations. The armed forces are also expected to play a role in Russia's Global War on Terrorism. The armed forces' primary responsibilities in the Global War on Terrorism are to safeguard Russia's weapons of mass destruction, all Ministry of Defense property and facilities, and navigation and air traffic and to engage in counterterror operations. The Ministry of Defense is also called on to support and coordinate counterterror operations with other federal agencies, to conduct counterterrorism intelligence operations, and to disseminate intelligence to other government counterterrorism units.

Borders

The potential flash points for conflict between the Russian Federation and its neighbors or international competitors are many; however, the likelihood that any would erupt into significant military action is low. There are border issues between Russia and nearly all of its northern and western neighbors, and Russia seeks to maintain economic and diplomatic dominance over all the states newly established after the collapse of the Soviet Union—areas it refers to as the “near abroad.” All of these states have sizable ethnic Russian populations who look to Russia for protection. The Baltic States are dissatisfied with their borders based on population distribution. When boundaries were drawn in the 1990s, many of their inhabitants were left in Russia. While the Finnish government professes satisfaction with its borders, many Finns seek to revise the borders imposed on them in 1940 and again in 1944, which created exclaves of Karelians in the south and other Finns on the eastern border. Ukraine's insistence on keeping traditionally Russian territory, including Crimea and the major naval base of Sevastopol granted to it in the 1950s, presents the largest obstacle to friendly relations. Russia is psychologically unprepared to accept permanent loss of these territories with their predominantly Russian populations and the strategic base of Sevastopol, traditional home of the Black Sea Fleet. The boundary between Ukraine and Russia through the Kerch Strait and Sea of Azov has still not been settled. Ukraine has inflamed the situation by seeking North Atlantic Treaty Organization (NATO) membership, which has been denied to it

so far. Friction still exists between Japan and Russia over the Kurile Islands taken by the USSR in 1945. Russia's relations with the states of the Caucasus are fraught with manipulation and intimidation. The two wars with Chechnya have left intense bitterness among Chechens and fueled Islamist terror groups, as has the continued presence of Russian troops. Russia seeks to destabilize Georgia and exploit ethnic tensions in north and south Ossetia and has employed military forces there to help their Ossetian “allies,” against Georgia. Like Ukraine, Georgia seeks NATO membership as a shield against Russian aggression and to forestall compromise with disaffected minorities who look to Russia for aid. Russia has consistently taken the side of Serbia against the United Nations, the European Union, and NATO with regard to Balkan territorial revisions and economic sanctions. The West's expansion of NATO into Eastern Europe, specifically Poland, Lithuania, Latvia, and Estonia, all of whom fear Russian intervention, is seen as provocative by the Russians. The Bering Strait maritime boundary between the United States and Russia is still unresolved, as the Duma has failed to ratify an accord proffered in 1990. Russia's provocative and groundless claims to the Arctic have alarmed the Nordic countries, Canada, and the United States. Under Putin, first as president and then prime minister, Russian foreign policy has been generally anti-Western and confrontational mostly as a sop to wounded Russian pride, but not aggressive to the point of risking war with NATO.

Future Prospects

The prospects for the Russian Federation to become more than a regional power in the next 10 years are very dim. Nevertheless, Russia, which has embarked on an ambitious, if not overly ambitious, plan of rearmament of all its services and branches, maintains a goal of reestablishing its global power. The collapse of the USSR wrought havoc with recruitment and retention of personnel and brought research and development of new weapons systems to a halt. With the end of the pro-Western Yeltsin era in 2000 and the ascendance of Putin, and the price of oil rising in the early 2000s, Russia was able to conceive of revitalizing its decrepit and decaying armed forces. Billions of rubles have been poured into the armed forces, especially in research and development of weapon systems; however, results have not yet materialized

in little other than prototypes of new tanks, missiles, aircraft, and warships. With the worldwide drop in oil prices in 2008 and the onset of a global recession, Russia's ability to fund a resurgent armed force as planned is in serious jeopardy. Before the recession, Russia's economy lacked vitality, and there is no basis for expecting any to be created when the global economic crisis wanes. While necessarily speculative, it seems clear that despite the confrontational nature of its diplomacy, Russia does not want war with the West, and obviously is not prepared for armed conflict. Limited objective skirmishes in the Caucasus are still possible, but as long as cool heads prevail, there is little potential for sparking wider conflict.

RWANDAN GENOCIDE

In 1994, at least 100,000 Hutus murdered approximately 800,000 Tutsis and 50,000 Hutus in the poor and compact nation of Rwanda. The genocide, whose

roots lie mythically in perceived ancient identities and modern ideas of nationalism and domination, wiped out the infrastructure of the nation, created a massive refugee crisis, and left millions of Rwandans suffering horrible physical injuries and emotional trauma. Prosecuting those responsible for committing the genocide, assisting victims with myriad needs, and building a stable and peaceful nation have been mammoth tasks for the government of Rwanda. With foreign financial support, the government of President Paul Kagame launched a unique way of rebuilding the shattered country by using an existing cultural problem-solving ritual: *gacaca*. This entry examines the clash between the Hutus and Tutsis, the events and people of the Rwandan genocide, and attempts to recover from the genocide.

Background to the Genocide

Any analysis of the Rwandan genocide must explain the history of complex relationships between Tutsi and Hutu stretching over five centuries and complicated by the exploitative and manipulative colonization policies of Germany and Belgium. Metanarratives that explain the origins of the Hutu and Tutsi peoples and justified the political domination of the former over the latter became mutually reinforcing and created a charged, polarized environment that made genocide possible. For reasons ranging from a selfish need to hang onto power, a desire to unify the Hutu people in the face of intra-elite factionalism and economic deprivation, and a desire to eliminate an alleged Tutsi “fifth column,” the Rwandan government under President Juvenal Habyarimana employed the extremist ideals of a “Hutu Power” movement dedicated to mobilizing Hutu peasants for genocidal participation. At its core, Hutu Power viewed the present as prologue to the repetition of the past in two critical ways. First, the Tutsis of the rebel Rwandan Patriotic Front had invaded the nation's northern provinces in 1990 just as their cattle-herding ancestors had supposedly done 500 years earlier. Second, in both cases, Hutu Power advocates argued, the Tutsi foreigners' goal was to subjugate the indigenous Hutu by (re) establishing a centralized aristocracy of Tutsi lords and Hutu serfs. Blasted through radio and television transmissions, Hutu Power justified and inspired the mass murder, rape, and mutilation of Tutsis as a desperate plan for self-preservation. By appealing to the foreign origins of the Tutsi, Hutu Power advocates

ironically borrowed from their former German and Belgium colonizers a biblical passage that explained Tutsi inferiority. The “Hamitic Myth,” extrapolated from the book of Genesis, depicted Tutsis as offshoots of Noah’s cursed son Ham who had migrated from northern Africa to Rwanda in the 15th century. On their arrival, Hutu Power proclaimed, the Tutsis used cattle as economic leverage to subjugate the Hutus, create an authoritarian monarchy, and rule as Belgium’s exploitative puppets. The Hutus, in this narrative, successfully revolted and supposedly freed all Rwandan Hutus from domination by the Belgians and the Tutsis in 1962, but that freedom was under siege once again.

A group of local children peer in at the debris and dead bodies on September 16, 1994, at a church in Ntarama, Rwanda. The bodies of 400 Tutsis murdered by Hutu militiamen were found in the church at Ntarama by an Australian-led UN team.

The ideals of Hutu Power would have had little influence outside of a small circle of extremists if the economic and political conditions in 1994 had not already created a climate of fear and anxiety in the Rwandan countryside. The late 1980s saw a collapse in coffee prices, growing unemployment of educated youth, rising population density that the arable land could not sustain, and a demand by the World Bank for economic “structural readjustment.” Adding to these economic pressures on the one-party state was growing elite fragmentation and an expanding civil war. The first postindependence government of Gregoire Kayibanda drew support and patronage from the south, but a military coup in 1973 by Habyarimana, reoriented the internal axis of power to the north and northwest. As southern Hutus increasingly chafed at their marginalization from power, Habyarimana’s allies believed that a unifying theme such as Hutu Power could restore Hutu cohesion while keeping themselves in positions of privilege. By most accounts, preparations for the genocide began just after the 1990 invasion. They included the formation and indoctrination of disaffected Hutu youth into militias and the holding of large Hutu Power rallies that paired local and visiting national political leaders. The effectiveness of these preparations was easy to see, as between 1990 and 1993, four massacres of Tutsis took place in Kibilira, Bugogwe, Bugesera, and Gisenyi. The April 1994 assassination of President Habyarimana, who by signing the Arusha Accords (a tentative peace deal with the Rwandan Patriotic Front, or RPF, a year earlier) had betrayed the Hutu Power cause, allowed Hutu extremists within his government to mobilize shadowy death squads and expand local massacres into organized national genocide. Over a period of 100 days, perhaps, 100,000 Hutus committed murder, rape, mutilation, and arson in an attempt to maintain a tenuous grip on power. Their attempt at a “Final Solution” to the Tutsi problem ended only with military defeat at the hands of the RPF and its occupation of the nation. Millions of Hutus, some of whom had committed genocidal acts, most of whom feared being killed in revenge, fled to neighboring countries. Another humanitarian crisis thus began.

The International Criminal Tribunal for Rwanda

The foregoing sketch makes clear the historically based, nihilistic, and populist nature of the Rwandan

genocide. No avenues for obtaining justice or restitution remained, as the Rwandan judiciary, along with the entire state apparatus, had crumbled and vanished. The Ministry of Justice itself lacked a telephone, a typewriter, and even windowpanes. Into this legal vacuum stepped the United Nations, whose Security Council members had acted during the genocide with willful neglect. To implement the Arusha Accords, the Security Council created the United Nations Assistance Mission in Rwanda. Its small strength of 2,500 lightly armed soldiers, its limited mandate that excluded the use of force, and the refusal of UN Director of UN Peacekeeping Operations Kofi Annan to allow the mission's Lieutenant General Romeo Dallaire to confiscate weapons caches from Hutu Power militias rendered its soldiers helpless to stop the genocide. After 10 Belgian soldiers were massacred by the militias as the genocide began, most nations withdrew their UN Assistance Mission in Rwanda contingents, leaving Dallaire with only 300 soldiers who nonetheless bravely saved many from a brutal fate. To rectify this sorry record, in 1994 the Security Council created the International Criminal Tribunal for Rwanda to try the leaders of the genocide, but the court soon ran into serious problems.

The difficulties encountered by the International Criminal Tribunal for Rwanda mainly emanated from logistical problems and inadequate administrative oversight. The court's remote location in Arusha, Tanzania; a lack of secure and reliable communications facilities; and administrative corruption hampered the panel's effectiveness from the very beginning. The court endured critical shortages of equipment, such as photocopiers, vehicles, and computer equipment. The first trial did not begin until January 1997, or 26 months after the Security Council had authorized the court's formation. Yet even after the trials began, complaints abounded about inappropriate judicial conduct, especially toward rape victims. A lack of resources and security for witnesses who traveled to Arusha to testify, the hiring of court personnel who themselves were suspected of committing genocide, and the extortion of defendants by court-appointed counsel only exacerbated the situation. The International Criminal Tribunal for Rwanda continues to try the most serious of suspects, having undertaken 77 prosecutions, 35 of which have thus far ended with a guilty verdict with appeals exhausted.

While international lawyers struggled to adjudicate cases of the leading genocidaires, the new

RPF-dominated government of Rwanda worked to consolidate its control over the country. Under Kagame's leadership, issues of security, reconstruction, and economic development came to the fore. More than 2 million Hutu refugees had fled to neighboring countries, creating a humanitarian crisis, conflicts with Tutsis and other groups who lived in Zaire in particular, and a threat to Rwandans living in border areas. Defeated Hutu militia leaders took over parts of the refugee camps, turning them into training centers for a possible invasion of Rwanda. Fortunately, within 3 years of the genocide, hundreds of thousands of those who had fled had returned peacefully to the land of their birth. The new Rwandan Patriotic Army, formed out of the RPF, supervised this difficult process, though Kagame raised regional tensions by invading Zaire to strike back at Hutu militias and aid ally Laurent Kabila in his successful drive to oust Mobutu Sese Seko as ruler.

Within the country, the genocide had produced devastation. Orphans roamed the countryside, while many surviving widows who were raped developed acquired immunodeficiency syndrome. Clean water was scarce, food supplies disrupted, electric power nonexistent, communications technology destroyed, hospitals looted, a government in flight, and upward of a million people dead or dying. Gross domestic product fell by 40% as a result of the genocide. The RPF-led government accepted foreign assistance from the United States and western European countries as well as a host of nongovernmental organizations that provided humanitarian assistance. Seeking to create a more balanced economy in a land where 90% of the population had farmed and that lacked natural resources, the regime welcomed foreign investment in a nascent mining sector to access deposits of cassiterite (used to manufacture tin) and coltan (used in consumer electronics). The Kagame government also quickly privatized the manufacturing sector, allowing enterprises to emerge that produced beer, cigarettes, soap, cement, and roofing materials. Gross domestic product rebounded in the years after the genocide, growing by 9% in 1995 and 13% in 1996.

Indigenous Judicial Remedies: The Gacaca Process

The gacaca process attempted to combine victim involvement, offender accountability, and the discovery of truth in order to remember the past *and*

develop a basis for coexistence. Beginning with Organic Law 40/2000 (passed by the Rwandan parliament in January 2001) and a pilot project created in June 2002, the Rwandan government approved the creation of local gacaca councils to judge most of the 120,000 individuals languishing in prison. The structures, numbering about 9,000 and presided over by 255,000 elected village elders, have deep, aboriginal roots within Rwanda's history as mechanisms to resolve local interpersonal and property disputes.

Each council, consisting of 19 noted persons of integrity, received cases that had gone through two preliminary steps. First, local general assemblies consisting of all adults in a given area compiled lists of victims and offenders. Second, each offender was placed in one of four categories according to the relative seriousness of his or her offense: Genocide planners and leaders were tried by Rwanda's formal judicial system, but those who participated in killing, inflicting nonfatal bodily injury, and property damage were called before gacaca councils at the prefecture, commune, and cellule levels, respectively. Those found guilty could appeal to higher level councils. The maximum available punishment was life imprisonment. Half of all prison sentences were spent performing community service. All who were convicted had to also pay into a national compensation fund for genocide survivors. Property crime offenders had to pay restitution directly to the victim.

The gacaca process is a cross between a truth commission and a court. Each council solicited the active participation of genocide survivors, who could ask questions of alleged offenders to discover what happened to themselves and their loved ones. Gacaca meetings were open to the public, and since they were held in local and accessible locations (often outside; *gacaca* means "grass"), Rwandan leaders hoped that they could serve as catalysts for national truth telling and reconciliation. This optimism is predicated on the assumption that offenders, having to stand before friends, relatives, and neighbors, will confess and ask for forgiveness. As an extra incentive to confess, prison sentences were halved for those who admitted guilt. Thousands of alleged genocidaires have subsequently confessed, though often the veracity of completeness of such accounts is questioned by survivors. More than 90,000 have been sentenced to community service in either work camps or local projects.

This informal, grassroots system of justice is not without its critics. Victims' groups charge that witnesses have been intimidated, bribed, beaten, and killed by relatives and friends of those accused. Some elected judges have been accused of participating in the genocide to varying degrees. Amnesty International and the Human Rights Watch have raised concerns about the due process rights of those accused, especially since most village elders chosen to lead gacaca councils lack formal judicial experience. Suspects do not have a right to consult lawyers. With thousands of geographically scattered councils in existence, achieving consistency in judging and sentencing was difficult. These criticisms and challenges notwithstanding, a simple lack of alternatives due to the gap between available financial and legal resources and the complexity of the task at hand, if nothing else, drove Rwanda's political leaders to embrace the gacaca process. The Rwandan government announced that the gacaca courts would continue until December 2009, with more than 1.6 million cases having been heard in all.

Gacaca cannot automatically repair the broken social relationships, provide satisfaction to victims through reparations and restitution, or create an accurate record of the dead, raped, and injured. It cannot, nor is it meant to, spark economic prosperity or create democracy in a troubled nation. Given the extreme alternatives of doing nothing or holding summary executions of alleged offenders, one might view gacaca as the best hope for doing *something* to benefit victims, promote reconciliation, and hold offenders accountable.

The future of Rwanda holds promise, especially if the government can chart a more democratic path. In 2011, Kagame won a second term as president with more than 93% of the vote, and international observers criticized the inability of opposition political parties to mount credible challenges. The media faced restrictions on propagating stories that might incite "divisions" within the population, which in practice had a chilling effect on reporters who criticized government policies. Domestic human rights groups exist, such as the Promotion and Defense of Human Rights and the League for Human Rights in the Great Lakes Region, though they and other nongovernmental organizations have faced registration impediments that could potentially endanger their existence. While there is little political violence, and the 2011 elections were peaceful, the lack of

truly open political debate and the fear of governmental repression prevent the emergence of a fully free democracy.

Economically, Rwanda has recovered well from the dark months of the mid-1990s, as the growth rate has remained at 7% to 8% a year since 2003 and inflation has stayed low. For the first time since the genocide, in 2010, Rwanda was self-sufficient in food production, though a majority of the population lives below the poverty line as subsistence farmers. Once the problems of energy shortages and poor transportation infrastructure are managed, the industrial and service sectors could develop more fully, as they already constitute more than half of the nation's gross domestic product. Kagame aggressively markets Rwanda to foreign investors. He self-identifies as a technocrat trying to leverage an increasingly educated people and stable investment climate while concurrently reducing his country's dependence on foreign aid and providing a safety net to the masses of poor citizens. Foreign investment mushroomed from \$32 million in 2003 to \$541 million in 2009, providing jobs and creating a cadre of indigenous skilled managers.

Almost 20 years after the horrific mass murders, Rwanda is a nation with an authoritarian political structure, a growing free market economy, and, at least on the surface, domestic tranquility.

S

SAUDI ARABIA

Located in the Arabian Peninsula, the Kingdom of Saudi Arabia was established in 1932 by Abd al Aziz, the leader of Al Saud (House of Saud) and a Wahhabi imam. The country is home to Mecca and Medina, the two holiest places for followers of Islam, and the Saudi ruling family gains legitimacy from safeguarding them. Saudi Arabia shares its borders with Jordan, Iraq, and Kuwait in the north; Bahrain, Qatar, and United Arab Emirates in the east; and Oman and Yemen in the south. The capital is Riyadh. As of 2010, the estimated population is 28.7 million, of which 5.6 million are foreign nationals. Saudi Arabia has 25% of the world's oil reserves, and it is the world's dominant oil exporter; thus, it is the leading actor in the Organization of the Petroleum Exporting Countries and the international oil sector. This entry discusses the government, economy, and armed forces of Saudi Arabia.

Government and the Economy

Saudi Arabia has been ruled by an absolute monarchy since its foundation. The king has the power of the legislative, executive, and judiciary and acts as the prime minister and presides over the Council of Ministers. Although the monarchy and the royal family dominate the political arena, ulemas (Islamic religious leaders) have been given significant power over government policies, as in Iran. However, Saudi Arabia made some changes in its governance structures. Notable changes include holding democratic elections at the municipal level in 2005—though

only men were allowed to vote, which is subject to change, in line with a 2011 announcement that promises to give women the right to vote in municipal elections—and the establishment in 2006 of the Bay'ah Council (Allegiance Council) for overseeing and regulating the succession of Saudi kings.

The Saudi economy remains highly dependent on oil production and exports. The Saudi Arabian Oil Company (Saudi Aramco), nationalized in 1988, has vital control of the country's most important resources. Consequently, Saudi Arabia's revenues are highly dependent on oil prices in the international markets. There have been attempts to diversify the Saudi economy, initiated by a royal decree in 1999. However, despite the support of the government, growth in non-oil industries has been slow. Development of the private sector has been hindered because of the vested interest of the royal family in the economy. In 2000, a new law was passed to encourage foreign investment in Saudi Arabia, which allowed foreign ownership of Saudi property, licensed projects, and reduced taxes on company profits by up to 30%. However, foreign ownership is not allowed in upstream oil, pipelines, media and publishing, insurance, telecommunications, defense and security, health services, and wholesale and retail trade. In 2005, Saudi Arabia joined the World Trade Organization. However, unemployment and unfair distribution of wealth remain significant problems for the country.

Armed Forces

Saudi military forces consist of the Royal Saudi Land Forces, the Royal Saudi Air Force, the Royal Saudi Navy, the Royal Saudi Air Defense, the Industrial

Security Force, the Royal Saudi Arabian National Guard, and paramilitary forces. As of 2010, Saudi military forces had 233,500 active personnel. The breakdown of active personnel in the respective services is as follows: army 75,000; navy 13,500; air force 20,000; air defense 16,000; Industrial Security Force 9,000; and National Guard 100,000. In addition, paramilitary forces have 15,500 personnel. The Industrial Security Force was established following the failed al Qaeda attack on the world's largest oil processing plant at Abqaiq in February 2006.

The Saudi army consists of three armored brigades, five mechanized brigades, one airborne brigade, one artillery brigade, one aviation command consisting of one attack helicopter brigade and one helicopter brigade, and one Royal Guard regiment. Notable equipment of the army includes M1-A2 Abrams and AMX-30 main battle tanks, AMX-10P

and M-2 Bradley armored infantry fighting vehicles, AH-64 Apache attack helicopters, and S-70A-1 Desert Hawk and UH-60A Black Hawk transport helicopters.

The Royal Saudi Navy consists of two fleets: Eastern Fleet (headquarters at Jubail) and Western Fleet (headquarters at Jeddah). In 2010, the navy consisted of seven principal surface combatants, 30 patrol and coastal combatants, seven mine warfare and countermeasure vessels, eight amphibious vessels, and five logistic and support vessels. Naval aviation has 46 helicopters, 12 of which can be armed with Exocet antiship missiles. Also, the navy has 3,000 marines.

The Royal Saudi Air Force is composed of five fighter squadrons, seven fighter ground attack squadrons, one airborne early-warning and command squadron, three transport squadrons, six

Military and civilian Muslims working with the International Security Assistance Force attend prayers during Eid al-Adha at Camp Safra in Helmand province, Afghanistan, November 16, 2010. training squadrons, and two transport helicopter squadrons. Most notable are F-15C/D/S, Tornado AVD/GR1A/IDS, Eurofighter Typhoon, and E-3A Sentry.

Saudi Arabia has the highest defense spending within the region. Between 1989 and 2010, the defense budget of Saudi Arabia fluctuated between 16 billion and 42 billion in constant 2009 USD. Its defense budget, in the aforementioned period, was between USD 8 billion and USD 14 billion. Saudi Arabia depends largely on foreign suppliers for its arms and military technology. The United States is the main supplier of arms to Saudi Arabia, followed by the United Kingdom, France, Switzerland, Canada, Italy, Belgium, Germany, Brazil, China, Turkey, South Africa, Austria, and Pakistan. Defense procurement and management are mostly dependent on the leadership, rather than on devised institutional planning. Thus, Saudi defense procurement at times was done without the proper consideration of workforce management, operations and maintenance, and sustainability, which creates more operational problems for the military than it resolves. Because of the workforce problems and lack of

trained personnel, Saudi Arabia depends on foreign personnel, mostly U.S. military personnel and security firms, for maintenance of the weapons systems, military advice, and training.

Legacy of the Persian Gulf War

Saudi Arabia allowed stationing of foreign troops following Iraq's invasion of Kuwait in 1990. Saudi Arabia remained a key ally of the United States during the Persian Gulf War, and Saudi troops participated in the liberation of Kuwait. The United States kept a presence of 5,000 soldiers in Saudi Arabia for Operation Southern Watch. The number of U.S. military personnel rose to approximately 20,000 after the Iraq War. However, the presence of U.S. troops in Saudi Arabia spurred reactions from Saudi society, and as a result, Saudi Arabians joined al Qaeda in large numbers; thus, al Qaeda started to target Saudi Arabia. In 2005, the United States withdrew most of its personnel from Saudi Arabia, leaving personnel only for the administrative and command purposes of the U.S. Central Command.

SCHELLING, THOMAS

Thomas Schelling is a Nobel Prize-winning economist, best known for his groundbreaking work applying game theory to questions of nuclear strategy and national security. This entry looks at the career and writings of Thomas Schelling, focusing on his views on game theory and his contributions to military strategy.

Schelling was born on April 14, 1921, in Oakland, California. He received a BA from the University of California, Berkeley, in 1944 and completed his PhD in economics at Harvard University in 1951. In 1953, Schelling became associate professor of economics at Yale University, where he spent the next 5 years. During this period, he began working as an adjunct fellow with the RAND Corporation, and in 1958, he left Yale to spend a year at RAND as a full-time researcher. His tenure at RAND proved extremely influential as he developed a general theory of strategy that could be applied to current problems of national security. In 1959, he returned to academia at Harvard University with a joint appointment in the Department of Economics and the Center for International Affairs. Throughout the late 1950s, Schelling produced a number of papers on bargaining and strategy that would form the basis of his most famous work, *The Strategy of Conflict*, published in 1960.

Schelling argued that the existing game theory, which emphasized zero-sum games (conflict scenarios where one player wins all and the other loses all), did not fully take into account more complex situations where players used bargaining techniques such as threats, promises, and even cooperation to achieve their objectives. He applied his modified game theory to a range of problems faced by the U.S.

military and national security community during the Cold War, including brinkmanship, deterrence, and the arms race.

In the late 1950s, the increasing nuclear parity between the United States and the Soviet Union called into question America's Cold War strategy, specifically the reliance on nuclear deterrence and massive retaliation. The Soviets' successful test of the world's first intercontinental ballistic missile and launch of the satellite *Sputnik* in the fall of 1957 made it clear to American strategists that the United States was increasingly vulnerable to a surprise attack. In *The Strategy of Conflict*, Schelling argued that since both the United States and the Soviet Union had already built up massive arsenals of nuclear weapons, stability could only be achieved by maintaining the ability of both sides to retaliate in the event of a nuclear attack. Therefore, any arms control measures had to promote stability, which Schelling defined as a "balance of deterrence."

Schelling's idea of nuclear stability presented a dilemma for military strategists: If neither side could deliver a lethal first strike and if massive retaliation meant mutual suicide, how could nuclear weapons be used as a deterrent to more conventional Soviet aggression? Schelling's answer to this problem lay in his concept of uncertain retaliation, or, as he put it in *The Strategy of Conflict*, "The Threat That Leaves Something to Chance." He argued in favor of putting pressure on the Russians through the use of graduated force and increasing threats targeting civilians. These measures, Schelling asserted, would deter Soviet aggression, because they would make the Soviets believe that the United States was capable of escalating conflict to the point of using nuclear weapons. This strategy of consciously using force to appear irrational in order to force one's opponent into backing down is one of Schelling's best known theories, and his ideas would have a direct impact on U.S. foreign policy in Vietnam in the early 1960s.

In 1961, Assistant Secretary of Defense Paul Nitze offered Schelling a job as an arms control deputy. Schelling declined the offer but recommended a colleague, John McNaughton. Schelling assured the reluctant McNaughton that he would bring him up to speed on arms control and strategy. By 1964, McNaughton had succeeded Nitze as assistant secretary of defense. That spring,

President Lyndon B. Johnson was considering military strikes against North Vietnam, and the plan of “graduated action” prepared by McNaughton and Secretary of Defense Robert McNamara essentially put Schelling’s theories of uncertain retaliation into practice. By the end of the year, following the Gulf of Tonkin incident and a mortar attack on a U.S. air base, the United States was ready to execute McNaughton’s plan. How to successfully use force in order to make the North Vietnamese back down was a dilemma, however. McNaughton contacted Schelling, and together they brainstormed the possibilities. Schelling argued that any campaign against the North Vietnamese should last no more than a few weeks; if it had not succeeded by then, it never would. However, he and McNaughton could not formulate an answer to the basic question of how to use force to make the North Vietnamese stop their aggression. Nevertheless, the bombing campaign known as Operation Rolling Thunder was launched on March 2, 1965. It had little to no effect on the North Vietnamese, who continued their aggressive moves. The Johnson administration, rather than heeding Schelling’s warning to withdraw, escalated the war, which continued for the next 10 years.

Throughout the 1960s, Schelling continued to publish on weapons policy and strategy, culminating in his 1966 work *Arms and Influence*. By the end of the decade, however, he had soured on U.S. government policy. In the spring of 1970, after the United States invaded Cambodia, Schelling led a group of Harvard professors to meet with Henry Kissinger, President Richard Nixon’s national security advisor. They openly broke with the administration and declared their opposition to U.S. policy; this action ended Schelling’s connection with the government. In the 1970s and 1980s, Schelling turned his attention to domestic issues, such as substance abuse, racial segregation, and global warming. In 1990, he left Harvard and accepted a position as distinguished professor of economics at the University of Maryland. In 2005, Schelling was awarded the Nobel Prize in Economics “for having enhanced our understanding of conflict and cooperation through game-theory analysis.” The Nobel Committee stated that Schelling’s “insights have proven to be of great relevance for conflict resolution and efforts to avoid war” (http://nobelprize.org/nobel_prizes/economics/laureates/2005/press.html). Currently, Schelling

continues to publish and speak primarily on arms control, terrorism, and climate change.

SCHOOL OF THE AMERICAS

The School of the Americas (SOA) was established in 1946 as the Latin American Training Center at Fort Gulick, Panama. Opened during the Cold War, its purpose was to train Latin American soldiers to fight against communist insurrection. The SOA is notorious for training several of the soldiers who took part in atrocities during the 1980s and 1990s in countries such as El Salvador and Argentina. In 2000, the SOA technically ceased to exist; in its place was established the Western Hemisphere Institute for Security Cooperation (WHINSEC) in 2001, on the same campus with the same overall goals but with a new and publicly stated emphasis on respecting human rights. This entry examines the history as well as the present-day condition of this controversial military educational establishment.

History and Controversy

As the Latin American Training Center, the school’s initial purpose was to train Latin American soldiers against communist insurrection. The students who

trained at the institution were both U.S. and Latin American personnel; Caribbean personnel were added in 1949. Its main purpose became to train these militaries to be effective against insurgency. In 1963, the Alliance for Progress, a program supported by President John F. Kennedy, enlarged the institution into the SOA.

The educational and training programs of the SOA touched on leadership, weapons, technical support, and other military-related skills. By the 1980s, the institution was helping create diplomatic tension between the United States and its southern neighbors. In 1984, after the signing of the Panama Canal Treaty, the SOA was forced to move its campus to the United States, and it settled in Fort Benning, Georgia.

In 1989, six Jesuit priests were shot and killed in El Salvador, and the majority of the soldiers associated with the shootings were found to have attended the SOA. The next year, demonstrations by Catholic protestors started and continued annually, with calls to close the institution resounding from various sectors of society against various human rights abuses committed by graduates of the SOA. Furthermore, in 1992, informational manuals containing instructions on torture tactics used as part of the SOA curriculum were leaked and published in the media, leading to more calls to shut down the school. Most of the literature on the SOA covers these human rights violations by the institution's graduates, and organizations such as the School of the Americas Watch and Amnesty International solely focus on this aspect of the SOA. In 2000, Congress missed closing the school down by just a few votes, but plans were nonetheless made to transition away from the existing program. At that point, nearly 70,000 students had passed through the doors of the SOA from over 20 countries. Most of the students were from Colombia, Peru, Bolivia, Honduras, and El Salvador, although a significant number came from other countries as well.

In its place, the WHINSEC was established in 2001. The institution utilizes the same campus as the SOA and has much the same curriculum, although the administration now emphasizes human rights and democracy. The focus is on what the school can create instead of what it can suppress.

New Mission and Administration

The new institution's stated mission relied on the principles set forth in the charter of the Organization

of American States, which emphasize peace and democracy, including the eradication of poverty and the drawing back of conventional weapons. The WHINSEC publicly dedicated itself to transparency among the Organization of American States nations and respect for democracy and human rights. Its stated purpose of providing education and training to Latin American and Caribbean military personnel was supported by Congress and signed into law by President Bill Clinton.

The school is supervised and managed by the secretary of the army, who is overseen by the Department of Defense. The institution falls under the army's Training and Doctrine Command (TRADOC), which is part of the Combined Arms Center at Fort Leavenworth, Kansas. The TRADOC and its subordinate organizations are required to provide training support packages for all military-related courses at the institution. The commanders of the U.S. Southern and Northern Commands (NORTHCOM and SOUTHCOM) participate in the selection and review of the curriculum because the school supports these entities.

A 14-member Board of Visitors was federally chartered within the law that established the new WHINSEC to oversee and report on the entire operation. The Board of Visitors is composed of representatives of the State Department, NORTHCOM, SOUTHCOM, and TRADOC, and also six civilian members appointed by the secretary of defense. These civilian members represent business, academic, religious, and human rights communities. This new addition to the administration of the institution ensures that the operations of the school can be independently observed and annually reviewed and that outside recommendations can be offered to the administrative staff.

In 2010, WHINSEC's budget was \$14 million.

Faculty, Student Body, and Curriculum

The SOA employs instructors from the U.S. military, U.S. foreign service, and international civilian instructors. The institution also invites outside professors, lawyers, and guest speakers to instruct the student body. Instructors native to Latin America and the Caribbean constitute 30% to 60% of the teaching faculty in order to be able to relate to the student body culturally and to bring hands-on experience and knowledge to the table. The current student body averages anywhere from 900 to 1,400 soldiers

Latin American students enrolled in the patrol craft officer course at the U.S. Navy Small Craft Instruction and Technical Training School extract students from the Western Hemisphere Institute for Security Cooperation during a field training exercise at the Stennis Space Center in Mississippi, March 6, 2009. The U.S. Navy Small Craft Instruction and Technical Training School provides partner-nation security forces with the highest level of riverine and littoral craft operations and maintenance technical training, while the Western Hemisphere Institute for Security Cooperation focuses on providing professional education and training to eligible persons of the nations of the Western Hemisphere within the context of the democratic principles set forth in the charter of the Organization of American States.

Source: Department of Defense photo by Francisco Melara, U.S. Navy (released).

per year. The majority of the classes are in Spanish, although there is an English-language-version professional development course for Caribbean personnel.

WHINSEC's curriculum consists of more than 20 courses, which mostly coincide with the courses given at the SOA. These include courses on leadership, military operations, and counterdrug operations, and even a law course. New courses include an inspector general class and a course on training. The focus on combat in these courses has led WHINSEC to experience protests continuing from the SOA years.

The Future of the SOA/WHINSEC

Plagued by a controversial history of human rights abuses and further burdened by a disturbing present, together with other U.S. institutions that sprang

up during the new war on terrorism, the future of the SOA/WHINSEC is uncertain. Advocates of the school emphasize the fact that the majority of its graduates have not been implicated in any human rights abuses and that some who were had only taken minor courses at the institution. However, oppositional groups assert that the SOA has done irreparable damage and continues to spread violent ideas that constitute a danger to freedom and democracy.

SCIENCE APPLICATIONS INTERNATIONAL

SAIC (formerly the Science Applications International Corporation) was founded as a private company in 1969 by J. Robert Beyster and a small group of

scientists in La Jolla, California. It offers a wide range of products and services in several industries, including national security, geospatial, cyber security, infrastructure, energy and environment, and health. The company went public in 2006. It has approximately 45,000 employees and averages more than \$10 billion in revenue annually. This entry discusses the history of SAIC and describes its products and projects, focusing on SAIC's defense technology.

SAIC is headquartered in Fairfax County, Virginia, and does extensive business with the U.S. Department of Defense and the U.S. Department of Homeland Security, as well as with various agencies within the U.S. intelligence community. It has had several former secretaries of defense and other high-ranking government executives on its board. SAIC has about a dozen subsidiaries, including a joint venture with the Bechtel Corporation, the largest engineering firm in the United States. SAIC and Boeing collaborate on modernization projects for the U.S. Army with regard to brigade combat teams.

One of SAIC's earliest defense-related projects was its 1991 participation in the dubious Stargate Project, a government-sponsored set of endeavors to ascertain whether there was any scientific basis for (and intelligence applications of) so-called psychic powers, such as precognition, clairvoyance, and remote viewing.

In 1999, SAIC commissioned and released a report on possible anthrax-related terrorist attacks executed using letters delivered by the U.S. Post Office. The report specifics were criticized for giving a blueprint to terrorists on how to successfully deploy an anthrax attack, including the maximum amount of material that could be sent in letters without arousing suspicion.

The National Security Agency in 2002 awarded SAIC a role in the agency's highly controversial Trailblazer Project, which was intended to secretly analyze computer network data. SAIC's role was to lead a consortium in producing a demonstration platform for the intelligence technology. A former SAIC employee, William Black, oversaw the project for the National Security Agency.

SAIC owns business lines in six different areas of defense technology:

1. *Weapons guidance:* SAIC manufactures unique guidance products and control systems that use the Global Positioning System and inertial navigation

techniques to precisely deliver airborne and ground-based munitions. Artillery shells can be directed using SAIC's technology to provide maximum accuracy and ensure minimal collateral damage, thus decreasing waste and increasing the variety of attackable targets. The SAIC guidance design uses real-time information to adapt to changes in meteorological conditions. Because SAIC guidance systems can be retrofitted to dumb munitions, formerly obsolete weapons can be repurposed for use in various challenging terrains and conditions.

2. *Mine Resistant Ambush Protected (MRAP) vehicles:* Vehicles need special armor to withstand attacks from improvised explosive devices and mines. SAIC manufactures MRAP vehicles with a unique, V-shaped hull that is said to better deflect explosive impacts. These vehicles perform several functions, including troop transport, convoy lead, ambulance service, and ordnance disposal. More than 300 different MRAP vehicle designs are under research and development at SAIC.

3. *Biometrics:* SAIC provides technology for the recognition and identification of individuals. Using a three-part strategy of fingerprint, face, and iris recognition, SAIC has produced more than 3,500 BATs (Biometrics Automated Toolsets) for the Department of Defense. These units interface with a database of more than 1.2 million individuals for use in recognizing enemy combatants, insurgents, and terrorists in U.S. combat operation areas. SAIC also uses voice recognition technology to enhance its touchless capabilities in warfighter aircraft employed by the U.S. Central Command. Additionally, SAIC works with the Coast Guard to test biometric devices that identify and catalog sea-based illegal immigrants in an effort to thwart terrorist infiltration into the United States. SAIC and the Coast Guard began collaborating on the Transportation Worker Identification Credential pilot program in September 2008. The program uses fingerprint and photo biometrics to track the movements of transportation workers into the United States.

4. *Modeling and simulation:* SAIC is a leading researcher in the area of computer-generated forces (CGF), which are computer simulations of combat that reliably reflect human factors. Typically, CGF exercises involve a small group of humans interacting with hundreds or thousands of simulated battlefield

entities for purposes of training and analysis. Importantly, similar SAIC technology (called the Automated Exercise Assessment System), is used to train homeland security responders for various types of attacks and disasters without expensive in-the-field exercises.

5. *Robotics*: SAIC participates in the Defense Advanced Research Projects Agency (DARPA) Grand and Urban Challenge races, which spur the development of driverless vehicles. The Defense Department has expressed interest in such vehicles as a way to remove human drivers from dangerous operations. SAIC's unmanned, lighter-than-air Skybus airships provide persistent surveillance and reconnaissance capabilities over battlefield terrain. These airships can remain on station for several days and have a low noise, thermal, and radar signature.

6. *Signal processing*: These are technologies involving advanced signal and image processing. SAIC works with the U.S. Navy to test and deploy its signal-processing software for the protection of friendly submarines and detection of hostile submarines. Advanced sonar software provided by SAIC is used to detect other submarines even when the host ship is maneuvering. SAIC also develops adaptive processing algorithms for airborne surveillance of weak, challenging signals. This software filters out strong signals to pick up low-power ground targets in difficult terrain.

SAIC has had at least two contracts with the Defense Department since 2003 to perform psychological operations in Iraq.

SourceWatch reports that in March 2003, SAIC received a no-bid contract from the Defense Department's Defense Contracting Command to establish the Iraqi Media Network, a U.S.-funded news and entertainment network that consists of television, radio, and newspaper assets in Iraq. The Iraqi Media Network was subsequently criticized by various journalists for acting as a propaganda tool for the Coalition Provisional Authority, which ruled Iraq at the time.

According to the *Washington Post*, SAIC and another firm were removed in 2006 from a \$300 million U.S. military contract pertaining to psychological operations to influence international opinion regarding the war in Iraq. SAIC had spent the

previous year "developing prototypes for radio and television spots intended for use in Iraq and in other nations where the United States is combating terrorism." A military spokesman cited inefficiency as the reason for terminating SAIC's contract.

SEALs, NAVY

Among the fittest, most highly trained, most versatile, most motivated, and most formidable of American special operations forces are the U.S. Navy SEALs. As the acronym conveys, the important characteristic that distinguishes SEALs from all other military forces is that they are maritime special forces that, while characteristically striking from and returning to the sea, effectively operate in all three elements: Sea, Air, and Land. This entry describes the training, organization, and operations of Navy SEALs.

Trained by the Naval Special Warfare Command (NAVSPECWARCOM), the naval component of the U.S. Special Operations Command (USSOCOM), SEALs are organized into small teams that specialize in reconnaissance and direct combat action, but they are also adept in antiterrorism, unconventional warfare, foreign internal defense, security assistance,

information warfare, counterdrug operations, hydrographic mapping, and personnel recovery. While relatively small in number (2,450 on active duty), SEALs are quick-reaction forces that maintain a continuous overseas presence in support of geographic combatant commands and national command authorities.

The major operational components of NAVSPECWARCOM are Naval Special Warfare Groups 1 and 3, based at San Diego (Coronado), and Groups 2 and 4, based at Norfolk (Little Creek). These components deploy SEAL Teams (1, 3, 5, 7 and 2, 4, 8, 10, respectively), SEAL Delivery Vehicle Teams, and Special Boat Teams worldwide. In addition to the 2,450 SEALs and 600 Special Warfare

Combatant-craft Crewmen (SWCC) on active duty, Naval Special Warfare assets include 1,200 reservists (325 SEALs, 125 SWCC, and 775 support personnel).

Historical Evolution

According to their official history, Naval Special Warfare operators can trace their origins to Scouts and Raiders, Naval Combat Demolition Teams, Office of Strategic Services Operational Swimmers, Underwater Demolition Teams (UDTs), and Motor Torpedo Squadrons of World War II. These operational assets were rapidly demobilized after the war. For example, the 34 existing UDTs were reduced to

U.S. Navy Special Warfare Combatant-craft Crewmen assigned to Special Boat Team 22 conduct live-fire drills on the riverine training range at the John C. Stennis Space Center in Mississippi, March 4, 2009. Sailors assigned to Special Boat Team 22 operate special operations riverine crafts and are assigned to Naval Special Warfare Group 4, the only U.S. special operations command dedicated to operating in riverine environments.

four, two based on each U.S. coast, with complements of seven officers and 45 enlisted men in each team.

UDTs were reactivated during the Korean War as part of the Special Operations Group. They conducted demolition raids against North Korean infrastructure assets and were instrumental to the success of the Inchon amphibious landing and mine clearing in Wansan Harbor.

While the establishment of the U.S. Army's "Green Berets" was perhaps the most conspicuous response to President John F. Kennedy's initiative to build up American unconventional military forces during the early 1960s, the U.S. Navy stood up SEAL Teams 1 and 2 in January 1962, composed exclusively of UDT personnel.

The new SEALs were assigned the mission of conducting counter guerrilla and clandestine operations

in riverine and maritime environments—a mission soon to be in demand during the Vietnam War. The UDTs also saw combat in Vietnam. The last SEALs left Vietnam in March 1973.

In May 1983, all UDTs were redesignated as SEAL Teams or Swimmer Delivery Vehicle Teams. The Swimmer Delivery Vehicle Teams were subsequently renamed SEAL Delivery Vehicle Teams. This was soon followed by the establishment of NAVSPECWARCOM on April 16, 1987. Special Boat Teams have joined SEAL Teams and Special Delivery Vehicle Teams as organizational elements of NAVSPECWARCOM. SEALs can be deployed ("inserted") into action by both surface and subsurface craft, as well as by fixed-wing and rotary-wing aircraft. A unique capability—the Maritime Combat Craft Aerial Delivery System—involves parachuting

combat craft from airborne transport aircraft. SEALs also have at their disposal “ground-mobility platforms”—specially designed and equipped vehicles, some armored and weaponized, for land operations. In fact, every member of a SEAL Team completes an intensive, 4-week, tactical ground-mobility training course, in which they learn the limitations of vehicles, basic maintenance, and tactical driving skills.

Basic and Advanced Training

Because of the extraordinary challenges and dangers inherent in their operations, Navy SEALs are put through what many military analysts believe to be the toughest training in the world. The intense physical and mental conditioning it takes to become a SEAL begins with Basic Underwater Demolition/SEAL training at the Naval Special Warfare Center on Coronado Island, California. The attrition rate is high, even among the hardest candidates. Successful candidates not only must withstand the highly demanding 6-month basic training course, but they also must succeed in 3 weeks of parachute training and a 15-week advanced training period prior to becoming a SEAL. Only then can the “graduate” pin on the Trident Insignia of all SEAL operators.

Meanwhile, SWCC go through separate, but similar, specialized training programs that emphasize special operations in the maritime environment. SWCC are trained extensively in craft and weapons tactics, techniques, and procedures. Focusing on clandestine infiltration and exfiltration of SEALs and other special operations forces, they provide dedicated, rapid mobility in shallow water, where larger ships cannot operate. Like SEALs, SWCC must be physically fit, highly motivated, combat focused, and effective in highly stressful situations.

Recent Operations

Immediately following the attacks on America on September 11, 2001, Naval Special Warfare forces put operators on the ground in Afghanistan. The first U.S. military flag officer to set foot in Afghanistan was a Navy SEAL in charge of all special operations for Central Command. In addition, a Navy SEAL captain commanded the Combined Joint Special Operations Task Force South, which included U.S. Navy, U.S. Army, U.S. Air Force, and allied special operations forces. Naval Special Warfare

forces continue to operate in Afghanistan in reconnaissance, direct action, antiterrorist, and related missions.

Naval Special Warfare personnel also played a significant role in Operation Iraqi Freedom, dedicating to Iraq the largest number of SEALs and SWCC in their history. They were instrumental in securing the southern oil infrastructure and offshore oil and gas terminals in the early phases of the campaign. They have captured high-value targets, worked to protect Iraqi elections from disruption, and established a foreign internal defense program for training and advising Iraqi forces.

Earlier SEAL operations in the Persian Gulf region included participation in Earnest Will (1987–1990) and Desert Shield/Desert Storm (1990–1991). Additionally, SEALs have conducted operations in Somalia, Bosnia, Haiti, and Liberia that have variously included extraction of U.S. citizens, disaster assistance, and piracy suppression.

In 2011 to 2012, the characteristically low-profile SEALs were the object of widespread public attention when it was announced that a so-called SEAL Team 6 had spearheaded the assault in Abbottabad, Pakistan, that killed Osama bin Laden on May 1, 2011. SEAL Team 6 reportedly consists of the “elite of the elite”—chosen from other SEAL teams and more intensively trained. In a negative turn of events, it was subsequently reported in August 2011 that members of SEAL Team 6 had been killed in the catastrophic shoot-down of a rescue helicopter by Taliban fighters in Afghanistan.

More recently, in January 2012, it was widely reported that SEAL Team 6 had rescued two non-governmental organization officials who had been kidnapped and held for months for ransom in Somalia—an American, Jessica Buchanan, and her Danish coworker, Poul Hagen Thisted.

Until these recent allusions to SEAL Team 6, little or no notice had been taken of this elite and highly secretive special operations unit. While it is more commonly known by its former name, SEAL Team 6 no longer officially exists. Its current official designation is U.S. Naval Special Warfare Development Group (NAVSPECWARDEVGRU), also referred to as “DEVGRU.”

Based out of Dam Neck Annex of Naval Air Station Oceana in Virginia Beach, the origins of DEVGRU can be traced back to the aftermath of Operation Eagle Claw, the failed 1980

White House: The National Security Team of President Barack Obama monitoring in real time the mission against Osama bin Laden, May 1, 2011.

Source: Official White House photo by Pete Souza.

operation ordered by President Jimmy Carter to rescue American hostages at the U.S. Embassy in Tehran, Iran. Dedicated to enhancing the navy's counterterrorism and extraction capabilities, the new unit soon came to be called SEAL Team 6. Several sources indicate that the name was chosen to confuse Soviet intelligence as to the actual number of SEAL teams in existence—there were only two others then.

In the late 1980s, the highly classified organization seems to have been reconfigured and assigned its new, and currently official, name (NAVSPECWARDEVGRU). Despite its official name change, Team 6's original name remains in use, albeit little referenced until recently. Indeed, the name itself is said to have long been classified.

SEXUALLY TRANSMITTED DISEASES

Sexually transmitted diseases (STDs) include gonorrhea, syphilis, chlamydia, human papillomavirus (HPV), herpes simplex virus, and HIV/AIDS. These are considered infectious diseases and share the characteristic of being transmitted principally or exclusively through sexual contact. This entry discusses the problem of STDs among U.S. military personnel and the U.S. military's efforts to screen for and treat STDs.

In the past, STDs have posed a major medical problem for all military organizations in the world, resulting in loss of time, military effectiveness, and even life. From World War I to World War II, the U.S. military attempted to control STDs through education, combined with scare tactics, with negligible impact. Prophylaxis proved more useful. Since the advent of effective medical treatments, such as the use of penicillin during World War II, STDs have declined as a major issue of military effectiveness. Morbidity due to STDs declined so markedly that they were dropped from the Military Disease Research Program. Nevertheless, because American military personnel are stationed all over the world, they come into contact with settings where STDs can easily be contracted. These diseases still pose considerable medical risks for those affected, but except for AIDS, the STDs rarely result in loss of time or combat readiness.

Gonorrhea (caused by *Neisseria gonorrhea*) and syphilis (caused by the spirochete *Treponema pallidum*) were both widespread in the U.S. population in the 19th century and created major medical problems for the U.S. military until the 1940s. During World War I, no infected soldiers were shipped overseas. Military officials supported efforts to promote chastity in the American Expeditionary Force. This may have helped contain the infection rate, though the army also sponsored and promoted chemical prophylaxis, which included washing the penis soon after intercourse and injecting protargol into the penis. The infection rate in the American Expeditionary Force remained at a relatively low 3.4%. Nevertheless, the U.S. Army lost

approximately 7 million person-days in less than 2 years of war due to these two venereal diseases.

In World War II, military personnel who were infected but whose disease was contained due to treatment were shipped overseas after the first year of the war. The War Department attempted a massive educational campaign combined with distribution of condoms—about 50 million condoms were used by the military each month of the war. Treatment regimens had improved by World War II, which minimized loss of time from these diseases. Both diseases were effectively contained with the use of penicillin after 1943. The first large trial using penicillin to treat gonorrhea was conducted by the U.S. Army and achieved a cure rate of 92.5%. Among recruits, syphilis was present in 4.5 out of 100 men until 1942. The use of penicillin essentially eliminated syphilis as a medical concern.

Even though gonorrhea cases still appeared in significant numbers (300 cases per 1,000 person-years) in the Vietnam War, syphilis cases were rarely reported. Today, rates of syphilis are so low that the services do not screen for it. Drug-resistant strains of gonorrhea, which became evident during the Vietnam War, remain a concern for military medicine. The strains of gonorrhea contracted in Southeast Asia required increasing doses of penicillin, from 1.2 million units of injected penicillin in the 1960s to 4.8 million units by the mid-1970s. The treatment of gonorrhea in the 21st century continues to be effective and uses a class of injectable antibiotics called the cephalosporins. Contemporary gonorrhea infection rates in the U.S. military match those of similar age and gender groups in the general U.S. population, about 5 cases per 1,000 person-years.

With the exception of HIV/AIDS, STDs do not generally prove fatal and today result in much less loss of time and military effectiveness. Infection with an STD (other than AIDS) does not preclude induction into the U.S. military. Nevertheless, chlamydia, herpes simplex virus, and HPV appear in high rates among military personnel. These still pose medical problems and create risks for members of the services, and they can adversely affect the long-term health of those infected.

Chlamydia (*Chlamydia trachomatis*) is the most common STD in the U.S. population and also in the American military. Chlamydia is asymptomatic, so screening is recommended. Studies have shown a prevalence of 9.2% among new female army recruits

and of more than 7% among army women in general. A 1996 study showed rates in the military to be three to six times the frequency in the corresponding state and national populations. The current policy of the Department of the Navy is to screen all sexually active female personnel aged 25 and younger as part of their regular annual checkups and to screen older women who may be at risk for chlamydia infection. Infection is treated with oral medication (tetracycline and its derivatives). Concurrent infection with gonorrhea is common, and both diseases can be treated effectively without loss of time or military effectiveness.

HPV results in venereal warts (*Condyloma acuminata*). These can become painful, and treatment consists of removal of the warts. HPV can also lead to an increased risk of cervical cancer. Use of the vaccine Gardasil is considered safe, but this is most effective when administered to girls who are below the age of 14 and who are not sexually active. It is not routinely administered to women in the military.

SHOCK AND AWE OFFENSIVE

Shock and awe offensive is a term that was popularized in March 2003, when it was used to describe the aerial bombing campaign that preceded the U.S. invasion of Iraq. The term was coined by Harlan K. Ullman and James P. Wade in their 1996 book *Shock and Awe: Achieving Rapid Dominance*.

Ullman and Wade argued in 1996 that the United States had a dominant position in the world due to its military capability. Military capability would allow the United States to achieve “rapid dominance” over its adversaries in war. The idea was that weapons systems could be used by the United States to impose shock and awe on its adversaries and eliminate an adversary’s will to carry on. This entry discusses the background, theory, and uses of shock and awe.

Background and Theory

The shock and awe offensive builds on ideas that were developed in the early 20th century. The idea of using a combination of air and ground forces to attack and shock the enemy was popular among armor and air force officers and theorists. The experiences of trench warfare and the stalemate in World War I were the driving force behind the development of new tactics and doctrine in the interwar period. Officers and theorists were eager to take advantage of developments in armor and military aviation. The goal was to bring future wars to a swift conclusion and reduce casualties.

In 1921, an Italian artilleryman, Giulio Douhet, developed a theory that air power could be used to break the enemy’s morale and end wars quickly, as set forth in *Command of the Air*. His theory was based on the idea that you could defeat an adversary quickly with air power before you defeated that adversary’s ground forces. Douhet wanted the Italian military to develop a heavily armed air force of “battle planes.” The air force would first strike the enemy’s air fields to eliminate the threat from another air force. Subsequent targets would include the enemy’s capital and major cities. Explosives, poison gas, and incendiary bombs would allow the air force to shock and demoralize the enemy. This shock would lead to early capitulation.

Douhet’s theory was expanded on by the British air marshal Sir Hugh Trenchard and was part of the instruction at the U.S. Army’s Air Corps Tactical School. The hope for the officers and theorists who observed World War I was swift victory through the shock of air power aimed at the enemy’s major cities to degrade morale.

Air Power and Shock

The start of World War II saw the employment of shock as part of the German blitzkrieg. Blitzkrieg or “lighting war” consisted of the coordinated

employment of armor, infantry, artillery, and air power by the Germans. This tactic enabled the German's to quickly conquer France, Poland, and large portions of Russia. However, the use of air power to shock Germany's adversaries was only a part of the strategy that Germany had developed. Shock in and of itself did not lead to the defeat of Germany's adversaries. The Germans subsequently used air power to attack and shock Great Britain in the Battle of Britain. But this did not lead to the demoralization and capitulation of Great Britain. Prior to 1945, the use of air power to achieve a shock effect had not led to the capitulation of any adversary.

In 1945, the United States developed the atomic bomb. The United States dropped the first bomb on Hiroshima, Japan, on August 6, 1945, and the second bomb on Nagasaki, Japan, on August 9, 1945. This is arguably the first case in which air power was used to successfully shock the enemy and achieve capitulation. The atomic bomb had a demoralizing effect on Japan. It capitulated on August 14, 1945. However, there were other factors involved in the capitulation of Japan. Japan had already been at war with the United States for almost 4 years. The Soviet Union also invaded Manchuria on August 9, 1945. Arguments have been made that it was the Soviet Union's invasion of Manchuria that led to the capitulation of Japan.

Nuclear weapons added a new dimension to the theory that was developed in the aftermath of World War I. However, the effects of the atomic bombs dropped on Hiroshima and Nagasaki were so devastating that the use of these weapons has been deemed immoral. Nuclear weapons are in a separate category from conventional weapons. They are not a factor in the debate over whether shock and awe can be successful.

The United States used air power to try to shock the enemy into submission in the Vietnam War. Specifically, Operation Rolling Thunder was the strategy employed by the United States between 1965 and 1968 to pressure Ho Chi Minh to abandon his efforts to take over control of South Vietnam. Operation Rolling Thunder consisted of the conventional bombing of targets in North Vietnam by the U.S. Air Force and U.S. Navy. The bombing had the opposite effect on Ho Chi Minh and the North Vietnamese.

Technological development and the availability of precise conventional munitions in the post-Cold

War period were a driving force behind the development of shock and awe. However, the nature of warfare in the contemporary operating environment complicates the idea that shock and awe can lead to victory. The United States found that the use of shock and awe did lead to the rapid defeat of the Iraqi army. However, this assault was followed by a ground assault. The rise of the insurgency in Iraq following the U.S. air campaign of shock and awe and the initial invasion has called into question the effectiveness of shock and awe in 21st-century warfare.

SINGLE INTEGRATED OPERATIONAL PLAN

The Single Integrated Operational Plan (SIOP) was the plan that coordinated the disparate tools of America's nuclear arsenal into one defense strategy. Created in 1960, under President Dwight D. Eisenhower, the SIOP was the first nuclear war plan that integrated all of America's nuclear weapons. The SIOP officially ended when the Operational Plan (OPLAN) became the organizing structure for planning nuclear strikes in 2003. The OPLAN still integrates the nation's nuclear weapons, but it is more flexible than the SIOP. The SIOP was a plan that embodied the concept of nuclear deterrence, mainly focused on the Soviet Union. This entry discusses the evolution of the SIOP and explains how the SIOP was put into use, both during and after the Cold War.

During the majority of the time the SIOP existed, the Soviet Union was the main threat that the United

States faced. The SIOP gave the president several different nuclear strike options from which to choose. These options ranged from a full-scale nuclear attack on Soviet urban industrial areas to a small-scale attack targeting only military installations. The SIOP also contained plans for a preemptive or a retaliatory strike depending on the national security problem faced at the time.

Prior to the creation of SIOP, there were no central organizing concepts to direct nuclear strikes. Each U.S. regional commander in chief, a 4-star general, had the authority to create a nuclear war plan for his command. Although the commands had specific geographic boundaries, their nuclear war plans often had overlapping target lists. The creation of SIOP eliminated this decentralized process and the redundant target lists.

The motivation to create a unified plan for the employment of atomic weapons was the Defense Reorganization Act of 1958. It gave the secretary of defense new authority to realize Eisenhower's vision of strategic unity. Eisenhower wanted to make sure that the nation's atomic forces, which were part of its strategic defense capability, were part of a single plan. This would prevent such weapons from being used inappropriately in a conflict and would clarify the targeting process to ensure that it supported the strategic objectives outlined by the president.

In its initial form, the SIOP was a blunt weapon, which if used, would leave no reserve nuclear force. Eisenhower's version of the SIOP did not contain the options of limited attack, which later iterations of the plan included. President John F. Kennedy instituted the first revisions of the SIOP when he assumed office. He introduced target categories ranging from individual Soviet nuclear weapons launch locations to one that included all civilian targets. If the need arose, the president could choose to attack only a specific target category or to attack all Soviet targets at once.

In the 1950s, the U.S. Air Force and the U.S. Navy each developed methods of deploying atomic weapons. The navy concentrated on submarine-launched ballistic missiles: the Polaris missile. The air force worked on nuclear-armed strategic bombers as well as its own intercontinental ballistic missile capability. Each service worked independently to develop its own weapons systems; it also developed individual plans for using these new systems in its

missions. This created a situation where the nation had several different plans for using the components of its nuclear arsenal but no overall plan to harness the entire strength of this capability. There were no unified target lists or agreements between services about which targets should be high priority.

An important part of the SIOP was prioritizing targets to determine which ones were appropriate for each category of strike. The plan was purely strategic in nature; it did not include the tactical nuclear weapons of the army and navy. It coordinated the three types of strategic assets of the United States: bomber carried munitions, ground-launched missiles, and submarine-launched missiles. The SIOP ensured that each strategic nuclear weapon targeted a vital enemy capability, installation, or avenue of approach.

The fact that two services had strategic nuclear weapons capability led to disagreements about how to effectively combine them into one plan. The air force initially argued that it should control the employment of nuclear weapons; the army, navy, and Marine Corps did not agree. The SIOP was a compromise that prevented the air force from appropriating control of all strategic nuclear assets, in favor of a joint planning group that would make the national target list.

The creation of the SIOP allowed the Department of Defense to coordinate the targeting of all its nuclear weapons. This came about through the creation of the Joint Strategic Targeting and Planning Staff. This was a joint planning group that included officers from all the service branches. It allowed for the collaboration of all the services in the creation of the SIOP. This meant that each service had input into the plan from its formative stages.

The SIOP integrated not just target lists but other aspects of war planning as well. It contained flight routes, measures of devastation of the weapons planned, information on expected enemy defenses, and descriptions of the type of detonation required to achieve the desired results for each target. This was part of the effort to ensure the proper coordination of a nuclear strike in order to maximize its effectiveness.

During the Cold War, the SIOP was part of the national defense strategy of deterrence. The plan, during this period, focused on Soviet, Chinese, and Warsaw Pact member nation targets. The plan gave

substance to the strategy of deterrence by working through the challenges of targeting, prioritizing targets, and ensuring cooperation among military services. Although circumstances never called for it, the SIOP gave the president and his military advisors clear guidance about how to best conduct a nuclear attack or counterattack.

Deterring nuclear war was the main objective of America's strategic nuclear capability. The SIOP was a fundamental aspect of the deterrence policy. Although each president, during the Cold War, revised the plan to suit the particularities of the security situation he faced, none eliminated it. Once created, the SIOP was the plan that marshaled America's nuclear strike force during the Cold War.

The president always had the authority to revise the SIOP. The following set of procedures

outlined the normal course for changing the SIOP. First, the president would outline his defense policy objectives and principles. The secretary of defense would use these to form the Nuclear Weapons Employment Policy. This document outlined how the use of nuclear weapons in a conflict would support the president's policy objectives. The document then went to the Joint Chiefs of Staff, who used this to form the Joint Strategic Capability Plan, Annex C (Nuclear). This annex refined the targeting lists and enemy objectives given in the Nuclear Weapons Employment Policy. The Joint Strategic Capability Plan then went to the Strategic Command in Omaha, Nebraska. There officials would use this information to make the actual war plans. This war plan was the actual SIOP.

U.S. Navy Vice Admiral John M. Bird, Commander, U.S. 7th Fleet, and Republic of Korea (ROK) Navy Vice Admiral Park Jung-hwa, Commander, ROK Fleet Command, sign into effect a new maritime operational plan during a reception aboard USS *Blue Ridge* (LCC 19), March 20, 2009, in Busan, ROK, marking the completion of the exercise Key Resolve, 2009. The revised operational plan sets the foundation for a smooth transition of wartime operational control responsibilities, currently held by Bird, to the commander of the ROK Fleet by April 2012.

After such revisions, the SIOP went through several different simulations to gauge its destructive value. The simulations would check the efficacy of each option and determine the amount of damage expected from each strike. This would give planners information on whether or not they had planned the correct type of nuclear munitions to attack a particular target. It would also give military planners and the president theoretical damage information from the resulting attack.

Although there were several options and strike packages available for the president to choose from, he did not have to limit his choice of nuclear deployment to the defined options. The president could modify a given option by removing some of the targets, or he could change the level of damage planned for a target. In addition to changing previously defined options, the president always had the authority to create new options that would specifically meet his objectives more clearly than the defined options.

Arms limitation treaties such as the Strategic Arms Reduction Treaty required the Joint Chiefs to reconcile proposed reductions with military requirements. The SIOP allowed the Joint Chiefs to effectively judge the strategic nuclear capability of the United States and determine the effect of any new arms limitation treaty. This provided the president with the information needed to ensure that reducing the strategic arms of the United States did not reduce its ability to defeat the Soviet Union in a nuclear war.

The ability to reconcile nuclear warheads with enemy targets also gave the president information that guided American requirements for Soviet arms reduction. If the United States had to decrease the number of warheads it had on hand to attack, then the president could require that the Soviet Union decrease the weapons that the reduced warheads targeted. This ensured that the reduction requests did not risk America's national security or improve the Soviet position with regard to nuclear capability.

After the Cold War, the emphasis of the plan changed with the changing strategic situation. As the threat from the Soviet Union and China dissipated after the fall of communism in Russia and the collapse of the Warsaw Pact, the threat of a chemical or biological attack from a smaller nation became more problematic. President George H. W. Bush

changed the SIOP in 1993 to reflect these new security concerns. For the first time in the plan's history, it contained targeting information for Third World nations. President Bill Clinton formalized this in a presidential directive that allowed the use of nuclear weapons in retaliation for a chemical weapon or biological weapon attack.

The SIOP provided an effective tool to plan the deployment of U.S. nuclear weapons. Although the majority of the time that defense planners used it was during the Cold War, it shaped the concept of nuclear deterrence in the post-Cold War era as well. The SIOP ensured that the president knew what U.S. nuclear weapons were capable of achieving. It allowed war planners to offer realistic projections about the destructive capability of specific strike options. It also provided a rubric to judge whether or not the United States had enough nuclear capacity to deter or defeat the Soviet Union. The change to the OPLAN in 2003 indicated the change in America's nuclear policy. No longer was one nation or an alliance the main target of America's nuclear arsenal. The OPLAN embodied this new understanding of flexibility and represented the changing threats from the Cold War to the post-Cold War eras.

SMALL UNIT COHESION

Small units are dependent on strong bonds built among members of squads or platoons, as well as the individual motivation and will to fight. Small unit cohesion exists as the strongest connection among soldiers and remains the strongest motivating factor in a soldier's will, even stronger than personal survival. These bonds often become so strong (especially during long combat periods), that their loyalties surpass even loyalty to higher organizations. This entry looks at studies of small unit cohesion and the role of small unit cohesion on morale and unit effectiveness.

Prior to World War I and the interwar years, little emphasis was placed on the needs of the regular soldier outside basic physiological necessities, and many supposed that future trends in technological warfare would eliminate much of the necessity for the human role in combat. The major contributions of strong, cohesive small units during World War II proved the vital role that this structure plays in the effectiveness of troops in long-term combat. While many obvious motivating factors such as a sense of duty and honor play a role in keeping troops motivated, effective small units depend heavily on the cooperation and positive relationships among members of a particular squad or platoon.

There are a number of other factors, physical and psychological, that contribute to a soldier's continuing will to fight. Personal survival, first and foremost, seems to fall aside when considering the collective needs of a cohesive unit, and this is furthered in demonstrations of soldiers risking their lives for members of their group (rather than for the ideological or political goals of combat). Leaders, on the other hand, not only provide that ideological motivation for their soldiers but also motivate the will to fight through positive relationships with the troops. The demonstrable effect of leadership on soldiers also extends to negative attitudes displayed by leaders, which spread similarly through the units.

These factors, both social and psychological, work together in a number of ways that affect small unit cohesion. Edward A. Shils and Morris Janowitz's 1948 study, "Cohesion and Disintegration in the Wehrmacht in World War II," sheds light on a number of key factors in the remarkably strong unit cohesion in the German army, even toward the final days of the war. Their study, based on wartime interviews with German prisoners of war from the Western front, reveals that soldiers were consistently more resistant to surrender or desertion when strong bonds existed among men of a particular unit, regardless of their effect on their personal survival or safety. The contributing factors to this cohesion included the German traditional notions of military honor, careful attempts by authority to maintain good relations among various levels of rank, and paternal attitudes adopted by German officers toward their troops (some even referred to their men as their *Kinder*, or children). These bonds rarely dissipated by the war's end, unless the group was cut off from supplies or medical attention.

This strong small unit cohesion is revealed to be part of the distinction soldiers made between primary and secondary groups, and their relation to their primary group (i.e., their small unit). Soldiers whose physiological needs were being met and who received esteem from their fellow group members formed tighter bonds with their primary group and placed its needs above their individual needs, often due to shared common experiences and a sense of external authority to keep individual aggression in check. Furthermore, at this level of cohesion, "secondary symbols," such as the Nazi regime and the moral and ethical dilemmas surrounding its war effort, remained just that and factored little into the day-to-day willingness to fight by the average infantry soldier. Political, ethical, and religious considerations were often secondary concerns in the minds of the prisoners of war interviewed.

Following the Vietnam War and prior to the Global War on Terrorism, the United States was typically involved in shorter, smaller scale conflicts that required less attention to small unit cohesion, as the units in question were often not in combat long enough for the issues to dramatically affect performance. Thus, army training shifted away from a focus on the small unit during the latter years

of the Cold War and the 1990s, and many traditional training methods were abandoned. However, with the nation involved in an ongoing war since 2001, army doctrine required a return to small unit strengthening. Unit cohesion also became an issue in recent years, with the debate leading up to the repeal of “Don’t Ask, Don’t Tell” and its effects on unit cohesion.

Furthermore, U.S. Army literature focusing on small groups has moved in a more technical direction, while focusing less on the interpersonal and social aspects of the units. Many modern scholars now suggest that unit cohesion is less important than task cohesion, or the ability of the group members to achieve a goal, and that task cohesion itself is the primary factor in unit performance. This idea is in opposition to an opinion put forth in an Army War College study on the Iraq War. These scholars cite a separate body of research that claims that there is no causal relationship between social cohesion and unit effectiveness.

Current army publications link unit cohesion and morale to a number of issues. First, leaders are designated the responsibility of maintaining their soldiers’ morale (along with health, welfare, and discipline), while remembering that mission accomplishment is still the primary focus. The Infantry Platoon field manual notes, however, that severe losses might become an obstacle in accomplishing a mission. Similarly, during retrograde, army leaders are advised that the effect on morale could be “devastating.” Other hindrances to unit cohesion and morale include severe casualties, fratricide, lack of supply, and slow tactical movement, which slows further as morale decreases.

The importance of small unit cohesion to overall morale and unit effectiveness is supported through the experiences of soldiers in combat, though questions of its precise place in current military strategy, if it requires one at all, abound. It has been demonstrated that well-organized primary groups experience a greater rate of combat effectiveness and higher morale and that proper leadership demonstrates the same effects. The social and psychological value of membership in primary groups with members of similar attitudes and shared experiences contributes to positive relationships with leaders, greater success, and strong interpersonal bonds.

SOCIETY FOR MILITARY HISTORY

With about 2,300 members in 27 countries, the Society for Military History (SMH) is the English-speaking world’s largest and best known body for the promotion of the study of military history. Founded in Washington, D.C., in 1933, the organization has gone through a series of name changes, beginning life as the American Military History Foundation (AMHF), becoming the American Military Institute (AMI) in 1939, and taking its current name in 1990. This entry discusses the history, mission, and publications of the SMH.

The organization started out as a collaborative effort among military publicists and researchers and archivists in the U.S. capital to help provide its military with the documentary resources to come to grips with its past and to wage future wars more intelligently. The moving spirit behind the launching in 1933 of the body intended to fill these needs, the AMHF, was Charles E. T. Lull, a former staff officer with the American Expeditionary Forces in France during the First World War. Lull had emerged from the war convinced that an organization was needed that would remedy what he saw as the U.S. military’s lack of understanding of not only the politics, culture, and military history of its allies and enemies but also its own history. This problem was due, Lull felt, to the military’s lack of contact with the civilian academics and professionals who possessed the

knowledge and access to the sources that could help fill these gaps. The AMHF's effort to bring these two groups together has been the leitmotif of the activity of its successor bodies ever since.

The AMHF did not prosper, however, even within the Washington, D.C., Beltway, where the bulk of its members lived and worked well into the post-World War II era. The Depression kept its numbers and the funding to carry on its activities at a low ebb. In 1938, the AMHF entered into merger talks with the Order of the Indian Wars, the organization for veterans of the Western Indian wars in the United States. Both of these bodies saw a certain synergy in a closer relationship, the AMHF being eager to expand its lagging membership and the Order of the Indian Wars keen to develop a higher profile and an eventual secure home for its records and papers, which included the unpublished memoirs and reminiscences of Indian war veterans. The formal merger of the two organizations finally took place in 1948.

In the meantime, the AMHF in 1939 became the AMI, and its journal, founded in 1937 as *The Journal of the American Military Historical Foundation*, was renamed first *The Journal of the American Military Institute* and then, 2 years later, *Military Affairs*, the name it would bear for the next half-century.

Perhaps surprisingly, the Second World War and the onset of the Cold War did little to bring the AMI out of the doldrums of the Depression era. The organization continued to have difficulty recruiting members and finding the funding to promote its activities and finance a journal. A series of budgetary crises in the 1950s nearly brought the AMI to collapse. Kept alive by support from other national historical bodies and the Department of the Army, the AMI's fortunes revived somewhat when the editorship of its journal, *Military Affairs*, was assumed in 1968 by Dr. Robin Higham of Kansas State University in Manhattan. The organization made its first appearance at a conference of the International Commission of Military History in 1973, and in 1984–1985, it adopted a more formal administrative structure and opened an office in Washington, D.C. In 1987, at a meeting in Richmond, Virginia, the AMI decided to take steps to expand the organization's membership nationally and to open its conferences to a more diverse range of scholarship in military history.

In 1988, with the termination of the contract to produce its journal at Kansas State University, the board of the AMI voted to transfer the offices of the publication to the Virginia Military Institute in

Lexington, Virginia. The initiative for the move came from Professors Blair Turner and Henry Bausum of the Virginia Military Institute, History Department and the late Dr. Larry Bland, editor of the George C. Marshall Papers at the George C. Marshall Library and Museum in Lexington. It was understood that the move to Lexington would entail not only a change of scenery from the plains of Kansas to the Shenandoah Valley but a transformation of the AMI into a more broadly based professional organization and of its journal into a more scholarly publication. In 1989, the AMI journal was rechristened *The Journal of Military History (JMH)*, a fully refereed quarterly academic journal, and in 1990, the organization itself took on a new name, the Society for Military History.

The move to Lexington has proved to be beneficial for the SMH. With financial support from Virginia Military Institute and the George C. Marshall Foundation, the *JMH*, under the editorship of Dr. Henry Bausum from 1989 to 1998, gradually established itself as the premier journal of military history in North America and subsequently in the English-speaking world. Agreements were negotiated to make the *JMH* available to readers electronically. All of this has led to a sharp rise in SMH membership, with a significant number of new members coming from outside North America, and much increased participation in the annual conferences of the SMH. Once confined largely to the East Coast of the United States, SMH conferences now take place across the United States, from Frederick, Maryland, to New Orleans, to Ogden, Utah, and across the Canadian border in Kingston, Ontario, and Calgary, Alberta.

Under its current editor, Bruce Vandervort, the *JMH* serves as a vehicle for the promotion of "the new military history," an approach to the subject that takes into account its cultural and social dimensions as well as those of a strictly martial and political nature. And while mindful that the bulk of its audience is interested in modern military subjects, with the U.S. Civil War and the World Wars of the 20th century leading the way, the *JMH* also has sought to diversify its offerings by including more articles and book reviews on ancient, medieval, and early-modern topics and by increasing the number of articles dealing with non-Western military history.

Each year the SMH offers prizes for scholarship in the field of military history. The Moncado Prizes, which are given for the best article appearing in each

of the four annual issues of the *JMH*, are named after one of the AMI's more colorful members, the Filipino general, politician, billionaire, and religious cult figure Hilario Moncado. The SMH's annual Samuel Eliot Morison Prize, named after the great Harvard historian of U.S. naval operations in World War II, goes to a military historian whose life work has made a significant contribution to scholarship in the field.

In 2007, the SMH entered into an agreement to transfer its archives to Kansas State University for safekeeping. The archival materials, dating back to the foundation of the AMHF in 1933, subsequently have been catalogued and are now open for public use.

SOCIOLOGY

Military sociology is the study of armed forces through the application of sociological concepts. It is the scientific analysis of the military institution as it functions independently as a self-contained organizational entity, or as it relates to the broader society. Research in the area of military sociology is extensive, cumulative, and often interdisciplinary, drawing from subjects such as psychology, history, political science, and economics. This entry discusses the beginning of this relatively new subfield of sociology, examines some of the topics recently investigated by military sociologists, and ends by projecting future directions in the field. Surely, the literature in

military sociology is far too vast to mention all the major works. Still, a few of the leading works in the field are highlighted below.

Historical Background

Military sociology did not emerge as a subdiscipline until World War II. During that time, the world witnessed technological advances in warfare. The use of jet aircraft, ballistic missiles, and atomic weapons changed both the nature of war and the way military institutions were structured. One of the earliest sociological studies addressing the possible consequences of technological change in the military was written by Harold Lasswell and published in the *American Journal of Sociology* in 1941. In this article, titled "The Garrison State," Lasswell recognized that the modern military officer had become expert at many technical skills and could consequently dominate society. This power elite theme would surface again in the 1960s.

Another seminal study on the military was published in an article titled "Cohesion and Disintegration in the Wehrmacht in World War II." This article, written by Edward Shils and Morris Janowitz, was published in the *Public Opinion Quarterly* during the summer of 1948. Based on interviews of German prisoners of war Janowitz had conducted while he served in the military, the authors applied sociological theories in their investigation of the resilience found among German soldiers in battle. Central to their analysis is the role the primary group plays in a soldier's ability to endure the hardships of war. Shils and Janowitz illustrated that the capacity of the primary group to resist disintegration was dependent on the group's acceptance of political, ideological, and cultural symbols that were directly associated with primary gratification. In other words, a soldier's ability to resist is a function of his immediate primary group's meeting his basic organic needs, such as food, sense of power, and self-esteem. They concluded that as long as the primary group structure of the component units of the Wehrmacht persisted, attempts by the Allies to cause disaffection by the invocation of secondary and political symbols, such as those about the ethical wrongfulness of the national socialist system, were mainly unsuccessful. Before this study was published, the extraordinary determination

of the German army had been attributed to the strong national socialist political convictions of the German soldier. The sociological analysis presented by Shils and Janowitz introduced alternative ways of understanding the commitment of soldiers during wartime.

Samuel Stouffer and his associates conducted a number of social psychological studies on men, and a few on women, in the army during World War II. In 1949, these studies were published in four volumes, titled *The American Soldier*. Included in this research were studies on race relations (attitudes of Negroes and attitude toward Negroes), the motivation to fight, social cohesion, morale, unit pride, the utilization of civilian occupational skills in army jobs, the Women's Army Corps, army wives, attitudes of enlisted men and officers, and many more. These studies formed the bases for subsequent research on race relations, rank relations (between officers and those enlisted), effects of combat, social cohesion, relative deprivation, and many other attitudinal measures of soldiers. Even today, data from these studies can be obtained from the Roper Center for Public Opinion Research archives at the University of Connecticut.

The post-Korean War period also witnessed the publication of major works in the area of military sociology. In 1960, Morris Janowitz published an extensive analysis of the military profession in his book *The Professional Soldier: A Social and Political Portrait*. In this study, Janowitz contrasts the military establishment of the 20th century with that of previous years, as well as with the contemporary militaries of other Western nations. Janowitz observed that authority and discipline had shifted from authoritarian domination to more reliance on group consensus. In addition, the skills required of military officers were bearing a greater resemblance to those necessary for civilian administrators and leaders. Officers were no longer being recruited from an exclusive, elite social stratum but rather from a broad base representative of the population as a whole. Career advancement in the modern military requires officers to be innovative yet work within the confines of the military institution. Unlike the military professional of the past, who was expected to be politically indifferent, the 20th-century military professional is expected to form political and social opinions. Among the themes discussed in

this book were those of military community, family relations, and civil-military relations. Some of these themes were further discussed in Morris Janowitz and Roger Little's *Sociology and the Military Establishment* (1965).

Many other sociological studies on the military were completed by the time Charles Coates and Roland Pellegrin published a text titled *Military Sociology* in 1965. In addition to the studies mentioned above, there were analyses of the scope and method of *The American Soldier* in an edited book, *Continuities in Social Research*, by Robert K. Merton and Paul Lazarsfeld. Echoing some of the themes discussed by Lasswell some two decades earlier, C. Wright Mills theorized that military leaders (*warlords*) were part of the power elite in American society. According to Mills, corporate, political, and military leaders were all members of this elite group. They shared a common worldview and dominated the economic, political, and military sectors of society. Additional topics discussed in Coates and Pellegrin's text included the organizational changes that had taken place in the U.S. military as compared with those that characterized the armed forces of European nations, military organizations as informal social systems, social stratification and mobility, race relations, and the role of women in the military. All of these topics and more formed the basis of contemporary military sociology. Much of the current research in military sociology is an expansion and/or refinement of the earlier studies.

Contemporary Studies

Today's military has changed, reflecting the economic, political, and social changes that have taken place in the broader society. There are more women in the contemporary armed services, and they serve in a variety of roles. More active-duty military members are married with dependent children. External to the military was a political movement to rescind military policy restricting gays and lesbians from serving openly in the military. These changes have helped shape the current research agenda on the military, by expanding on old topics and creating new ones. Some of the topical areas in the sociological study of the contemporary armed services include peacekeeping missions, the Global War on Terrorism, social representation (race, gender, the

intersection of race and gender, religion, ethnic relations, and, more recently, sexual orientation), and the militaries of developing nations.

Over the past two and a half decades, the United States has been engaged in more military operations other than war. Although the armed services have always participated in peacekeeping operations, there has been a greater emphasis on such operations in the U.S. armed services since the 1990s. An example of a sociological study on the U.S. peacekeeping mission in Somalia is the one conducted by Laura Miller and Charles Moskos in the early 1990s. These authors analyzed the attitudes and feeling of soldiers who were engaged in humanitarian efforts, many for the first time. Among the many peacekeeping operations performed by military personnel are those requiring humanitarian assistance and disaster relief, as was the case in New Orleans during and after Hurricane Katrina and, more recently, in Haiti. One question is what is required for military units to perform these operations, and others like them, successfully.

Sociological research is also expanding in the area of military community and military families. A study of army families conducted for the Family and Morale, Welfare and Recreation Command by B. Booth, M. Segal, and Bruce Bell revealed that dependent family members actually outnumber military personnel. The ratio of family members to service members is higher in the army than in the other services. These large numbers may be associated with the military benefits they receive. In an effort to meet personnel goals in the current all-volunteer force, military organizations provide incentives for servicemen and servicewomen to marry by offering compensation and benefits for families, especially in the form of subsidized housing and health care. Yet, while there are many benefits associated with military service, there are costs as well that raise questions about service member and family readiness. One of the questions explored by sociologists studying military families, especially during war, is what effects deployment has on service members' intentions to remain in or leave the military. Another area of inquiry is how advancements in satellite and Internet technology have facilitated fast and decentralized communication between deployed soldiers and their families.

Another recent trend in today's military is the increase in the number of civilian contracting firms

and civilian contractors hired by the Department of Defense. Thus, a relatively new area of inquiry in military sociology is on the effects of military outsourcing on a number of factors ranging from the attitudes of active-duty personnel to military effectiveness. A central question is what effect the integration of civilians into the armed services has on military personnel. What is more, the increasing number of civilians losing their lives in war zones (the Persian Gulf War as well as the wars in Afghanistan and Iraq) raises additional research questions about civil-military relations.

Future Directions

There is and will continue to be a wealth of data and research questions on the military. Many of the future investigations will expand on previous studies. Issues of race, gender, and religion will continue to be explored. Studies of peacekeeping operations will also continue. Among the additional topics that will be addressed in the future is whether or not the all-volunteer force is practicable in the United States with modest changes in recruitment and incentives for the services to meet personnel goals. Conversely, is it necessary for the United States to reinstitute the military draft to ensure a cost-effective military? A possible alternative to both the all-volunteer force and military draft would be for the U.S. government to implement a program of voluntary national service. The issue of personnel procurement will probably never be completely resolved and will continue to surface in scholarly literature on the military.

Another subject that will be studied is that of sexual orientation. The "Don't Ask, Don't Tell" policy, forbidding homosexual service members from serving openly in the U.S. military, was enacted in 1994. Within a decade after the policy was implemented, many law and military officials began to view it as being out of step with the values of the nation and the military. Congress began to take steps to have the policy abolished. The Military Readiness Enhancement Act Bill, introduced by Congressman Martin Meehan in 2005 and reintroduced in 2007 and 2009, called for a repeal of the "Don't Ask, Don't Tell" policy. Both years, the bill failed. Finally, the "Don't Ask, Don't Tell" Repeal Act of 2010 was introduced, passed by both the House of Representatives and the Senate, and signed into law by President Barack Obama on December 22,

2010. Determining the best way of implementing this new law and examining its effect on military readiness, effectiveness, unit cohesion, recruitment, and retention are topics for future studies in military sociology.

Yet another subject that will attract a lot of attention in the near future is the military veteran. There has been a growing interest in researching issues pertaining to male and female veterans since the United States has been involved in the Wars in Iraq and Afghanistan. Many of them return home with battle scars to a society that is ill prepared to render them the type of support they so desperately need. Medical problems including physical injuries and mental traumas are being addressed by medical doctors and clinical psychologists. In addition, there are myriad issues concerning military veterans that extend beyond the medical field. There are social issues pertaining to mental illness and social stigma, economic issues pertaining to unemployment and homelessness, political issues pertaining to entitlements and benefits, and the intersection of these problems and the question of how these issues may affect female and male veterans differently. These and other issues pertaining to military veterans are additional topics that will be examined by military sociologists well into the 21st century.

SOFT POWER

The concept of soft power was developed around 1990 by Joseph S. Nye Jr., currently distinguished service professor of the Kennedy School of Government at Harvard University and former assistant secretary of defense for International Security Affairs in the Clinton administration. Distinct from “hard” economic and military power, soft power refers to the power of attraction deriving from a country’s culture, values, ideals, and policies. Political scientists and scholars of international relations have closely scrutinized the analytical strengths and limits of the soft power concept since it entered the public discourse in the 1990s. This entry defines soft power, examines the sources of soft power, and the difficulty in measuring soft power, and discusses public diplomacy activities.

Soft Power and Its Resources

According to Nye, there are basically three ways to influence the behavior of others to obtain the outcomes you want: coercion, inducement, and attraction. Soft power is concerned with the third dimension, attraction. While hard military and economic “command” powers basically rest on coercion and inducement, soft power refers to a nation’s ability to get a desired outcome through the “co-optive” power of attraction. Nye also stresses that legitimacy, credibility, and moral authority are central to soft power. In international politics, soft power serves as an instrument for states seeking to influence foreign populations by shaping and appealing to their values, interests, and preferences.

Nye argues that the soft power resources of a country rest primarily on three things: its culture, its

political values, and its foreign policies. The United States is blessed with ample sources of soft power. They include the political values and ideas embodied in the Constitution and Bill of Rights, the U.S. economic and educational systems, popular culture, the leadership of international institutions that help set the global agenda, and America's history as an immigrant nation. In this regard, Nye strongly suggests that the United States is in a unique position to wield influence through soft power.

The Intellectual Backdrop to the Development of the Soft Power Concept

Nye initially developed the soft power concept to counter the then prevalent argument for the decline of American power most vocally articulated by Paul Kennedy's work *The Rise and Fall of the Great Powers* (1988). In his seminal work *Bound to Lead* (1990), Nye, not in agreement with the talk of American "decline," maintained that the United States remained the strongest nation not only in military and economic power but also in soft power.

In the early 2000s, Nye, a strong critic of the George W. Bush administration's approach to Iraq, warned against the overreliance on hard military power. Alarmed by the low opinion of U.S. foreign policy and the rise in anti-American sentiments in the world, Nye argued for the incorporation of soft power into the overall U.S. strategy as an alternative to the Bush administration's militarism. More recently, Nye has advocated "smart power," which skillfully combines both hard and soft power to achieve the nation's foreign policy goals. Nye, thus, argues that the important task ahead for U.S. diplomacy is to sharpen the strategic vision of how to integrate soft and hard power into "smart power."

The soft power concept thus has not merely been an academic one. It conceptualizes a form of real power that a country possesses to wield its influence, in the conduct of its diplomacy, so as to promote its national interests and security. In the American context, Nye has developed and polished the soft power concept to restore American leadership in global affairs.

Analytical Strengths and Challenges of the Soft Power Concept

The soft power concept has contributed to a more detailed understanding of a country's power in

international politics in today's world. For the soft power concept to be useful in analyzing today's international politics, however, the following key issues should be clarified.

First, as Nye himself acknowledges, much of U.S. soft power has its origin in organizations in civil society as diverse as Hollywood, Microsoft Co., Harvard University, and so on. As private sources of soft power, they are outside or beyond the control of the U.S. government. For the U.S. government to deploy America's soft power to achieve the goals it has set involves a difficult task. Second, values and culture are by their nature hard to measure and evaluate directly. The contribution of the soft power concept to our understanding of a country's power lies in that it conceptualizes a power different from quantifiable hard power (for economic power by gross domestic product and for military power by military expenditures). The very fact that soft power is difficult to measure is the major reason why some political scientists and policymakers are not so enthusiastic about embracing it as a genuine power ready for use in international politics. Third, how to monitor and evaluate how the power of attraction is perceived by the receiver is difficult. Depending on how they are received by target audiences, there is always the possibility of a gap between the intentions of the transmitter of soft power and the perceptions of its receiver.

In any event, it requires a long-term perspective to evaluate whether or not causal relationships exist between policy inputs utilizing soft power and their outcomes.

Soft Power and Public Diplomacy

The kind of diplomatic activities in which the government of a country utilizes its soft power is called public diplomacy. Public diplomacy generally refers to official government efforts to promote national interests and security by engaging, informing, and influencing foreign populations. From a U.S. perspective, it is a tool to influence public opinion in foreign publics and mobilize it in ways that support U.S. foreign policies and their objectives, by promoting greater appreciation and understanding of U.S. society, culture, institutions, values, and policies. Thus, public diplomacy can be viewed as a prime example and expression of soft power. During the

Cold War period, the entity in charge of public diplomacy was the U.S. Information Agency (established as an independent agency in 1953). After the agency was abolished in 1999, its functions and personnel were absorbed into the State Department. The abolishment of the U.S. Information Agency signaled that the U.S. government gave short shrift to public diplomacy after having won the Cold War on “ideas.”

However, there have been urgent calls for revitalizing public diplomacy after the September 11, 2001, terrorist attacks and the Iraq War, against the backdrop of a serious image problem facing the United States, that is, the image of U.S. unilateralism based solely on military superiority, in spite of the Bush administration’s efforts to sell the Iraq War as a just war. Diplomatic circles in America, both official and private, have been concerned that the United States is losing its friends and its influence, even among traditional allies, and that anti-American sentiments are rising, especially in the Arab/Muslim world. In this situation, public diplomacy programs designed to foster increased understanding of U.S. culture, society, and policies are increasingly relied on as an effective weapon in the Global War on Terrorism. In terms of dollars, the budgets for public diplomacy programs have been increasing over the years (currently around \$536.5 million), although they remain well below 1% of the Pentagon budget.

At present, there are a variety of public diplomacy activities sponsored by the U.S. government. They include educational and cultural exchange programs, such as programs to send American performers and artists abroad and to bring secondary and college students to U.S. educational institutions; international broadcasting using radio, satellite TV, and the Internet, including the State Department’s International Information Programs website, InfoUSA; and programs to promote dialogue between American citizens and foreign publics. It is particularly noteworthy that in recent years, the U.S. government has expanded its public diplomacy efforts in the Arab/Muslim world. They include expanding educational exchanges and launching international broadcasting aired by Radio Sawa and Alhurra Television. These programs have been designed to win over the hearts and minds of the populations of Muslim countries, especially the younger generation.

Effectiveness of U.S. Soft Power as Measured by Opinion Polls

One of the quantifiable pieces of evidence used to measure, however imperfectly, the effectiveness of soft power is favorability ratings in opinion polls conducted in foreign countries.

According to the opinion polls conducted by the Pew Global Attitudes Project in 2009, the image and perception of the United States have improved markedly in most parts of the world, including western Europe, especially after the inauguration of President Barack Obama. Also, according to the Asia Soft Power Survey conducted by the Chicago Council of Global Affairs in 2008, America enjoys high levels of soft power in all the surveyed countries, including China, Japan, and South Korea. The survey has confirmed that Asians generally see U.S. cultural influence as strong, pervasive, and positive; regard U.S. leadership of international institutions as most effective; and have great respect for American popular culture, education and political systems, and diplomatic standing.

However, the image and perception of the United States among Arab/Muslim populations remain largely unfavorable. Again, according to the 2009 Pew Global Attitudes Project, while opinions of the United States held by the Arab/Muslim public in a few countries (including Jordan and Egypt) improved after the inauguration of President Obama, they remain largely unfavorable among the eight Muslim countries surveyed, particularly the Palestinian territories and Pakistan; only in two nations, Indonesia and Nigeria, did a majority of Muslims express a positive opinion of the United States. Furthermore, the recent opinion polls conducted in 2012 by the Pew Global Attitudes Project have revealed that the image of the United States held by Muslim nations has not improved significantly during the Obama presidency. In particular, the antiterrorism policy of the Obama administration, including drone attacks, is widely unpopular among Muslim nations. The same opinion polls have also found that American soft power, including ideas about democracy and popular culture, generally receives low ratings in Muslim nations, although young people are more likely to embrace such ideas than their older counterparts.

There are several factors involved in the Arab/Muslim perceptions of the United States. They hold

deep resentment toward the United States, partly because there has been a significant gap between the trumpeting of American values (freedom and democracy) by the U.S. government and its actual actions, symbolized by the mistreatment of prisoners in the Abu Ghraib prison. The rather dismal state of America's reputation and standing in the Arab/Muslim world suggests that public diplomacy using soft power resources does not easily produce the intended results.

Some observations should be made in regard to the relationship between the Arab Spring (a period of grassroots demonstrations and wars in the Arab world that began in 2010 and saw the toppling of authoritarian regimes in Tunisia, Libya, and Egypt) and soft power. There is no doubt that the pro-democracy movements that have sprung up in the Arab world since 2010 have been motivated by the Arab peoples' genuine attraction to and desire for democracy, freedom, and human rights, all of which have their origins in Western ideals and culture as soft power. Taking note of this, some American analysts have suggested that the support by the U.S. government and U.S. nongovernmental organizations for liberal democratic institutions in the Arab world has contributed to the Arab Spring revolts. It remains to be seen, however, whether or not the U.S. government will put promoting democracy before achieving regional stability when pursuing its strategic interests in the region. In any event, for American soft power to be an effective resource to promote national interests, it is imperative for the U.S. government to substantiate its democracy promotion rhetoric with credible action buttressed by soft power programs in its foreign relations with the Arab world.

Conclusion

There is no denying that the United States has vast resources of soft power. While it is still premature to judge the effectiveness of the use of soft power by the U.S. government in pursuing its foreign policy goals, it should be remembered that there is a linkage between the successful deployment of hard power and the projection of soft power. Arguably, the U.S. experience in the past 10 years or so suggests that heavy-handed use of hard power might reduce or squander soft power.

Furthermore, it is important to note that for U.S. soft power to deliver the desired outcomes, the issue

of who uses what elements of soft power for what goals in what context holds the key to a successful application of soft power. Most important, as critics of current American public diplomacy have suggested, instead of taking a high-handed method of transmitting American values (which includes a tinge of imposition) to target foreign audiences, an interactive, dialogue-based approach should be adopted in the deployment of America's soft power. In doing so, it is essential to listen to the needs and perspectives of target audiences abroad, as well as to show respect for their culture and their ideals. Perhaps only then can America's enormous soft power be expected to bring about long-term changes in the perception, attitude, and behavior of foreign publics.

SOMALIA

Somalia is virtually synonymous with the Horn of Africa—the protruding landmass that juts out from northeast Africa into the Indian Ocean. Unlike other Horn of Africa states, the whole country falls within this geographically prominent region. Measuring about 637,657 square kilometers, the republic was curved out of the huge Somali-inhabited territory in East Africa, which measures up to 1 million square kilometers. In its north-south axis, it stretches from the border of Djibouti to Kenya; and in the east-west axis, it expands from the shores of the Indian Ocean to the Ethiopian border. Though mostly flat and semiarid, the country has a wide-ranging landscape with diverse ecology, that is, mountains, plateaus, valleys, and coastal plains that, if properly managed, are sufficient to sustain native vegetation and livestock. It is watered by two rivers, the Juba and Shabele. In addition, the country receives an annual rainfall of about 11 inches, which in some areas creates powerful rivulets that carry water to distant locales. However, due to lack of planning and water conservation, the country is susceptible to drought and famine.

Ethnically, the Somali people belong to the Hamatic stock of nations and speak an ancient Afro-Asiatic language known as Cushitic. Although they are racially related to their neighbors—that is, the Oromo, Afar, Saho, and Beja—they form a distinct nationality defined by a common belief in Islam and their Arabian descent. Despite their Asian connections, Somalis are indigenous to the Horn of Africa and have over the millennia adapted to the region's meager resources and tumultuous social environment. Nomadic, equalitarian, and fiercely

independent, they have been fittingly described as “a fierce and turbulent race of republicans.”

The Somali people are ethnically and culturally homogeneous. However, with the exception of a brief period in the 16th century, they did not reside in one state. Rather, they existed as an ethnic community containing countless clans who squabbled over water and pasturage. It took the European conquest in the late 19th century to unite them, make them aware of their social affinity, and kindle their national sentiments. Under colonial rule, Somali nationalism spread and finally matured after the Second World War. With the ensuing wave of decolonization that swept the African continent after the war, the country gained independence in the summer of 1960.

The Somali Republic was formally constituted on July 1, 1960, when the British and Italian Somali colonies gained independence, merged, and chose Mogadishu, the seat of the Italian administration, as the national capital. After independence, statehood and nation-building were continually undermined by lingering clanism and the traditional aversion to authority. These cultural propensities were, however, kept in check by the postcolonial state until the late 1970s, when the ruling military regime was enfeebled by a costly war with Ethiopia. The following two decades saw a proliferation of clan-based opposition to the government, without a unifying ideology or center of loyalty. After the fall of the government, these so-called political movements turned against one another until they totally dismantled the state and ended the Somali people's short-lived experimentation with statehood (1960–1991).

History of Somalia's Precolonial Army

The history of Somalia's armed forces spans more than 400 years. Dating back to the later period of the Awdal Empire (ca. 1528–1591), Somalia had known formally constituted national armies, though they were usually irregular and unregimented. According to Sihab ad-Din Ahmed, during the reign of the legendary Imam Ahmed Ibrahim al-Ghazi (1528–1543), locally known as Ahmed Gurey, each of the seven constituent principalities of the Somali Empire boasted a standing army of tens of thousands of men. Of these, large numbers were mounted and equipped with firearms—essentially, matchlocks and cannons—that were imported to Zeila, the capital

of the empire, by Arabian merchants. In addition, the Somali army counted among its ranks many Turks, Moors, and Arabs, who were attached to the court of the Islamic ruler. Thus, by the early 16th century, when the Somali-Abyssinian wars broke out, the Somali army was arguably one of the largest and best equipped forces in sub-Saharan Africa. It took the army only 5 years to rout the enemy forces, put their king to flight, and virtually take over their whole country.

Colonial Armies: Precursors of Modern National Armed Forces

Great Britain enjoys the distinction of laying the foundation for Somalia's modern armed forces. As early as 1884, London created the Somaliland Coastal Police, which claims the proud appellation of being the first modern Somali force. Like other early peacetime armies in the continent, the force began with a modest size and a limited role—that is, patrolling the coastline, with occasional sallies into the interior. Organized and deployed on the twin principles of efficiency and parsimony, the force remained small until 1898, when the colony began to cover its fiscal expenses. Subsequently, the outbreak of the Dervish Rebellion, led by Sayyid Mohamed Abdalla Hassan (known in the West as the Mad Mullah), dictated the expansion of the native colonial army. Meanwhile, famine and other economic hardships facilitated native recruitment. As a result, within a year, the numbers of the local troops jumped from a mere 240 to 1,000 infantry and 500 mounted men. Trained and equipped with modern military hardware, the Somali Levy, as the force was renamed, became “one of the region's best trained military units.” The establishment of the Somaliland Camel Corps some 10 years later further bolstered the numbers and the fighting prowess of the Somaliland corps.

In Italian Somalia, the recruitment of the native army did not begin until the end of the 19th century. As a recently unified nation and a latecomer to the colonial scramble, Italy was hampered by financial difficulties and a lack of colonial experience. In fact, on November 25, 1896, when Antonio Cecchi, Italy's first governor of Somalia, was ambushed and killed some 12 miles outside Mogadishu by local warriors, he had only 70 native soldiers with him.

In 1910, following the early pacification campaigns, the colonial authorities created two police forces, a regular contingent and a rural constabulary known as *gogle*.

The accession of the Fascist Party to power in Italy sped up the process of native recruitment in southern Somalia. As soon as he assumed the governorship in Mogadishu in December 1923, Cesare Maria De Vecchi di Val Cismon, the first fascist governor in the colony, initiated a dual-track policy of reorganizing the existing forces and recruiting new ones. Still, the size of the colonial army remained modest (numbering only 800 men) until 1925, when a rebellion in *Majertenia* (currently Puntland) necessitated the expansion of the Somali *Bandas* (irregular militia).

A decade later, at the start of the Italo-Ethiopia War of the 1930s, the Italian authorities in Mogadishu again organized an irregular contingent of border guards, known as *Dubat*. Undrilled and probably underpaid, the *Dubats* were allowed to operate like “raider bands” and live off the land. After Italy's defeat in 1941, its colony along with its army was brought under British control. The two colonial forces remained integrated until 1950, when the victorious Four Powers (the United States, Great Britain, France, and the Union of Soviet Socialist Republics) agreed to return Italian Somalia to its former colonial master, Italy, but this time supervised by the United Nations Trusteeship Council.

Somalia's Postcolonial Armed Forces

The Somali Republic gained its independence in the summer of 1960. The state was constructed from the merger of Italian and British colonial territories. The union of the two colonies also encompassed the reintegration of the colonial troops. From the British colony came the Somaliland Scouts, while the Italian side contributed the *Forza di Polizia della Somalia* (Police Force of Somalia). Put together, they numbered only 3,700 armed men.

Before liberation, the development of Somalia's military was hampered by colonial policies. This was even more so in Italian Somalia, where the United Nations Trusteeship Council, which exercised ultimate governing authority on the territory from 1950 to 1960, explicitly barred the creation of the Somali

military. This is why at independence the size of the country's armed forces was modest. With the addition of 1,000 hastily organized local recruits, known as the *Darawishta*, the number of the nation's armed forces rose to 4,700 soldiers. It was from these modest beginnings that in less than two decades of statehood the Somali National Army (SNA) evolved into one of the largest, best equipped, and best trained military machines in sub-Saharan Africa.

According to General Jama Mohamed Ghalib, who held various posts in the postindependence governments, the architect of the national military, as the SNA was popularly called, was His Excellency Abdullahi Issa Mohamud, then the prime minister of the Provisional Administration (1956–1960) of Italian Somalia. From the mid-1950s, Issa's government, in violation of the Trusteeship Council's policy, secretly recruited young officers who would lead the future national army and sent them overseas for military training. Those who returned home before independence were temporarily attached to the Somali Police Force (SPF). In December 1958, at the approach of freedom, the prime minister created the posts of police commandant and deputy commandant with the intention of moving some of these forces into the soon-to-be-created national military.

As planned, upon independence, the nation's armed forces were split into two commands, the SPF Command and the SNA Command, and placed under the able leadership of Generals Mohamed Abshir Muse and Daud A. Hersi, respectively. In addition, the prime minister's regime "militarized" a small contingent of Civil Aviation personnel (about 350), which was "Somalized" in 1954, and attached them to the SNA. Headquartered in Mogadishu, the national capital, both commands were charged the twin tasks of national security and social integration. Since they were less corrupt and less clannish than their civilian counterparts, the armed forces became a source of pride and a symbol of national unity.

Somalia's Armed Forces During the Cold War

The bane of Somalia has always been its geographic location. Situated on the easternmost corner of the African continent, the country is on the pathway between Asia and Europe. Its coastal waters, the

Gulf of Aden, connect the Red Sea and the Indian Ocean. During the Cold War, the two superpowers, the United States and the Soviet Union, competed for control of this strategically important country. On its part, Somalia, motivated by the cause of the "missing Somalis,"—French-ruled Djibouti, the Ogaden in Ethiopia, and the Northern Frontier District in Kenya—actively sought and received economic and military aid from the two superpowers. Consequently, from the early 1960s to the mid-1980s, when the Cold War ended, the size and state of preparation of Somalia's armed forces had vastly increased.

At independence, Somalia inherited a pro-Western regime whose budget was heavily subsidized by Italy, Britain, the United States, and West Germany. However, the Western aid was skewed to nonmilitary sectors. Ties between Somalia and its Western benefactors soured in 1963, when Mogadishu approached them with a request to expand the size of the SNA from 6,000 to 20,000. Coming in the middle of the Cold War, Somalia's military buildup was perceived in the West as a threat to its regional allies—principally Ethiopia, Kenya, and France—and was shrewdly rebuffed. The disappointment forced Mogadishu to seek military assistance from the Eastern bloc countries, especially the USSR and the People's Republic of China, which agreed to equip, train, and more than double the size of Somalia's armed forces.

Mogadishu's acceptance of socialist aid marked the arrival of the Cold War in the Horn of Africa. The deal led to the expansion of the nation's armed forces but fractured the country's relationship with the West, especially the United States. The overthrow of the pro-Western government in 1969 by a military junta, who professed "scientific socialism," exacerbated the fissure. In 1974, when the Soviet Union rewarded her new African ally with the highly coveted Treaty of Friendship and Cooperation, the expansion and modernization of Somalia's armed forces was well under way. Before the breakdown of the two countries' relationship 3 years later, the Kremlin boosted Somalia's armed forces to more than 30,000 heavily armed troops and a modest air force of about 2,700, including 66 combat aircraft. On its part, Mogadishu awarded its communist benefactor a military base in the port city of Berbera and an intelligence-gathering

station in *Balidoole*, located 90 kilometers from Mogadishu.

Soviet Perfidy and the Big Switch

Between 1970 and 1977, Somalia anchored Soviet interest in the Horn of Africa, and the country was handsomely rewarded for the cooperation. The Soviet Union and East Germany equipped and trained the SNA and SPF, respectively. From the communist perspective, these forces were arrayed against “Western imperialism.” Since the African states were “progressively inclined,” they were “natural allies” of the socialist world. Wars between them had to be discouraged. Accordingly, when Somalia attacked Ethiopia in 1977, a country with socialist credentials, the Kremlin severed its ties with Mogadishu and shifted all economic and military assistance to Addis Ababa. Betrayed and wounded, on November 13, Somalia abrogated the 1974 Friendship Treaty, the linchpin of Soviet-Somali relations, and began to cultivate diplomatic ties with the West.

During the tenure of the Friendship Treaty, Somalia was receiving friendly overtures from the U.S. government. For instance, on April 6, 1977, President Jimmy Carter was widely quoted in the mass media as having instructed his secretary of state, Cyrus Vance, and national security advisor, Zbigniew Brzezinski, “to move in every way possible to get Somalia to be our friend.” Four months later, the White House floated a promise of military assistance to Somalia should the latter leave the Soviet camp. The enunciation of the Carter Doctrine, the creation of the Rapid Deployment Force, and the radicalization of Ethiopia’s military junta made Somalia ever more attractive to Washington. Thus, in August 1980, Carter, although initially hesitant to arm Somalia, offered a military agreement to Mogadishu.

Under the agreement, the United States would inherit Soviet facilities, including the Port of Berbera, while Somalia would receive military and economic assistance from the West. A year later, Carter’s successor, Ronald Reagan, increased American aid to Somalia. Unlike his predecessors, Reagan was not satisfied with the mere “containment” of the Soviet Union. Instead, he sought the reversal of communist gains in the Third World. The best way to achieve this, he thought, was through an expensive

arms race. Thus, during the Reagan administration, Somalia’s armed forces peaked at 90,200, with a defense budget of about USD 130 million.

Organization of Somalia’s Armed Forces

Before the collapse of the state in 1991, Somalia boasted about 160,000 troops. Of these, the military, as the SNA was popularly known, claimed 70,000 well-trained and well-equipped fighters. The SNA was subdivided into corps, divisions, brigades, and battalions. According to General Mohamed Salah, who oversaw their training, the SNA had four corps and 12 divisions, which were lumped into five regional commands and at least one independent base in Kismayo, the regional capital of Lower Juba. All of them came under the command of a single joint chief of staff, who was directly responsible to the minister of defense.

The remainder of the national forces was accounted for by the air force, the navy, the police, and the so-called Youth Pioneers, a quasi-military unit of about 10,000. Of these, the SPF was the largest, consisting of three main corps—the *Daraawishta*, a paramilitary frontier force; the *Birmadka*, an antiriot, emergency unit; and the Territorial Police, which operated all the police stations in the country. In addition, the SPF operated specialized technical services, such as the Custodial Corps, Health Services, Communication and Transportation Units, the Immigration Office, Interpol, the Criminal Investigation Department, the Special Operations Unit, a fire brigade, and a police training academy.

In the 1980s, Reagan’s arms race strategy fueled the growth of Somalia’s armed forces. The end of the Cold War removed the rationale for continued American support. The lack of a great power patron reduced the inflow of material and technical resources. The rise of clan-based movements—the Somali Salvation Democratic Front, the Somali National Movement, the Somali Patriotic Movement, and the United Somali Congress—politicized the troops. Competition for power and resources among the top brass sapped the morale of the troops. After 1988, when they were routed in northwestern Somalia (currently Somaliland) by the Somali National Movement, the nation’s armed forces began to disintegrate. The caretaker government of Ali Mahdi Mohamed (1991–1992),

installed after the collapse of the military regime of General Mohamed Siad Barre, oversaw the final dissolution of Somalia's armed forces—once a symbol of national pride and unity.

The USC Militia and the Black Hawk Down Incident

Somalia's armed forces were disbanded but not destroyed when General Barre's regime folded in January 1991. They simply melted into their respective clans, where some of them assumed military leadership. They fought their last major international battle on October 3–4, 1993, against the American Special Forces—Delta assaulters, Rangers, Navy SEALs, and a SOAR regiment—who had come to the country on a humanitarian mission. For 2 years before the Black Hawk Down incident, as this 2-day battle is famously known, the country was riven by a bitter civil war that disrupted food production and distribution and set off widespread famine. The American troops were deployed by President George H. W. Bush on December 4, 1992, to secure Mogadishu's seaport and airport, open access roads to the starving population, and protect food distribution centers in southern Somalia. Since these roads and facilities were controlled by one General Mohamed Farrah Aidid's militia, who collected toll fees, the American interference was bound to excite local animosity.

Somali animosity peaked in June 1993, when the United Nations representative and head of the American mission to Somalia, Admiral Jonathan Howe, ordered the arrest of General Aidid, whose militia had ambushed Pakistani troops earlier that month. It was the attempt to capture the general that led to the Black Hawk Down incident. During the battle, the Somali fighters were armed with light weapons, such as RPGs, AK-47s, and PKM guns. Their American adversaries, a 160-men assault force, were equipped with M-60 machine guns, .50 caliber machine guns, and M16 rifles. Their arsenal also included attack helicopters, Humvees, trucks, and surveillance aircrafts. With additional ground troops to join them later, they formed what Mark Bowden, in his book *Black Hawk Down*, called “a formidable sum of men and machines.”

The Battle of Mogadishu, as the incident is also known, ensued for 2 days. It marked the

most intense battle the Americans fought since the Vietnam War. Whatever the Somalis lacked in fire power, they made it up in numbers, military experience, and knowledge of the terrain. As soon as the battle began, they shot down two MH-60 Black Hawk helicopters and captured one of the pilots, Chief Warrant Officer Michael Durant. In addition, they trapped and pinned down some of the special forces who came to rescue their fallen comrades. These had to be in turn freed, with additional cost of men and materiel. Before they withdrew the next day, the Americans suffered 18 deaths and 57 troops wounded. The Somalis followed them with more attacks, killing 3 more soldiers and wounding 34 others. On their part, the Somali militia sustained a staggering number of casualties—estimated up to 500 lives. However, they took comfort in repulsing one of the most powerful armies in the world.

The State of the Somali National Army

Between 1991 and 2004, when the Transitional Federal Government (TFG) was constituted, Somalia had no organized national army. All professional soldiers either joined their clan militias, migrated to other countries, or slowly melted into society. The creation of the TFG in 2004 necessitated the reconstitution of the SNA. On assuming power, the former took a dual-track approach: (1) to recall whatever was left of the former military personnel and (2) to train new volunteers. Since the country's training academies were destroyed by the civil war, the new forces had to be prepared in the neighboring countries, that is, Ethiopia, Kenya, Uganda, Sudan, and Djibouti. Shabbily constituted, inadequately equipped, and small in size (about 14,000), the present Somali army is merely a shadow of its former self. For almost a decade, the armed forces were unable to stabilize the country.

To supplement its army, the TFG formally requested peacekeeping troops from the African Union in 2007. Acting on the Somali appeal, the African Union's Peace and Security Council launched the African Union Mission in Somalia. Headquartered in Mogadishu, the African Union Mission currently deploys more than 14,000 fighters in the country. Its concept of operation is to deploy, control, and stabilize the security situation in Mogadishu in one sector before fanning out into the

others. In its early phase, the African mission registered some success. However, as an auxiliary force, it poses a long-term threat to Somalia's national security.

Summary

To sum up, the history of Somalia's modern armed forces spans more than 100 years. Dating back to the late 19th century, when the Somaliland Coastal Police was created, Somalis have known formally constituted armies—though sometimes irregular and unregimented. The turbulence of world politics coupled with the Somali people's desire for national unity necessitated the militarization of the Somali Republic. At present, neither appears to be waning. Instead, both are feeding on new issues and grievances. This suggests that Somalia will rearm in the long run. Although a revanchist Somalia will not

pose a threat to great powers like the United States, it will undoubtedly challenge the security and stability of the states in the region.

SOMALIA INTERVENTION

This entry examines the history of humanitarian and enforcement interventions in Somalia that took place in the 1990s and their legacy. Initially, the United Nations intervened in the early 1990s to avert a humanitarian crisis and deployed a small peacekeeping force to ensure delivery of desperately needed food to starving Somalia. In 1992 and 1993, with the support of the outgoing administration of

George H. W. Bush and the incoming administration of Bill Clinton, the UN mission expanded to include nation-building. Despite the commitment of substantial American forces to support the UN, this mission went disastrously wrong and led to the American and the UN withdrawal from Somalia. The legacy of Somalia would call into question the role of the United States in nation-building as part of the United Nations or in other multilateral efforts.

The Fall of General Mohamed Siad Barre

During the Cold War, Somalia was heavily dependent on foreign aid from the United States. As a result of this dependency, Somalia never developed a stable and sustainable economy. The U.S.-supported Siad Barre regime was preoccupied with retaining power

rather than developing democratic governance or a capitalist system. It became embarrassingly apparent in the late 1980s that the Barre regime was increasingly relying on human rights abuses against the regime's detractors to retain power. As the Cold War wound down, the U.S. government felt that it could no longer overlook these excesses, and foreign aid from the United States to the Barre regime ended in 1989. This resulted in the end of Siad Barre's control of Somalia in January 1991, and the state soon fractured into pieces as 14 Somali warlords vied for control. At one point early in the conflict, the prized capital city of Mogadishu was divided between five powerful warlords, including Siad Barre's main political rival, Mohamed Farrah Aidid.

United Task Force and UN Operations in Somalia I

A refugee crisis ensued, which is still plaguing Somalia and neighboring states to this day. What little economy and agricultural production there was ground to a halt because of the fracturing of the state and an ongoing drought; as a result, there was mass starvation and malnutrition. The United Nations responded with a small force of fewer than 5,000 UN peacekeepers and civilians to distribute aid to the starving Somalis. The United Nations had relatively little experience, outside of the Congo peacekeeping mission of 1960, with delivering humanitarian aid in a hostile environment. As such, little aid was getting through, and many warlords saw this aid as a direct challenge to their authority. Mohamed Aidid declared that a battalion of Pakistani peacekeepers stationed in Mogadishu would no longer be tolerated, and the rival warlord, Ali Mahdi Mohamed, ordered the shelling of aid ships and forced several to turn back before delivering any humanitarian relief.

On December 3, 1992, the United Nations Security Council (UNSC) passed Resolution 794, authorizing the use of military force to distribute humanitarian aid and enforce a tenuous cease-fire between the warring factions in Mogadishu. It should be noted that because there was no functioning central government in Somalia, Chapter VII of the United Nations Charter was invoked in an effort to establish a peacekeeping mission. This created numerous initial headaches as the United Nations was now experimenting with peace enforcement,

or even peacemaking, and was not engaging in a traditional peacekeeping mission in which a host nation government has invited in a UN peacekeeping presence.

President George H. W. Bush used UNSC Resolution 794 to commence large-scale U.S. military involvement with the initiation of Operation Restore Hope, in which the U.S. military would take the lead in delivering humanitarian aid and enforcing the cease-fire. The Unified Task Force (UNITAF) set up by President George H. W. Bush, under the command of the U.S. military, eventually swelled to approximately 40,000 international troops, of which 28,000 were American. U.S. Marines made up the majority of the American contingent and were primarily charged with protecting and delivering humanitarian aid shipments and protecting civilian personnel operating in Somalia. The rules of engagement were defensive in nature, but the UNITAF forces made it clear from the outset that attacks on food shipments or personnel would be dealt with quickly and forcefully, keeping the lanes of aid flowing during the initial stages of military operations in Somalia.

However, the UNITAF mission lacked a political objective undergirding the humanitarian initiative, which would have been acceptable had the peacekeeping forces left after starvation was alleviated. The original intent behind the UNITAF mission was to have the humanitarian objectives met, and the troops withdrawn from Somalia before President Bill Clinton took office. Unfortunately, the political situation on the ground caused one of the main belligerents, Mohamed Aidid, to interpret the peacekeeping presence in a very political way. Because Aidid's main political rival, Ali Mahdi, had been elected under suspicious circumstances at a UN-brokered conference in July 1991, Aidid logically viewed any UN peacekeeping effort as an attempt to legitimize Mahdi as the Somali president. However, Aidid initially avoided, as did Mahdi, direct conflict with UNITAF forces; they focused most of their military actions against each other and other smaller, rival clan lords. The brutality of the fighting in 1991 and 1992 resulted in tens of thousands dead and hundreds of thousands displaced, many of whom were civilian noncombatants. The reliance on indiscriminate shelling was particularly devastating and destabilizing for the Somali people.

Despite the overall failure of the UN intervention in Somalia, the initial goal of the mission to distribute food and other humanitarian aid was a success. Unfortunately, Aidid was consolidating power in Mogadishu at roughly the same time starvation was coming under control and a strained normalcy was returning. Neither the United Nations nor the United States reached out to Aidid at this time or recognized him as the victor. Aidid continued to view the peacekeeping/peace enforcement mission as a threat to his political survival.

UN Operations in Somalia II

The UN mission entered into mission creep as President Bill Clinton took office. UNITAF operations resulted in hundreds of thousands of lives saved, a temporary end to starvation, and a return to some semblance of normality in Somalia, albeit with no functioning central government. However, U.S. and UN leaders were at a loss regarding what to do next. There were some who felt that the mission was complete and that troops should be withdrawn from Somalia; but these voices were few, and the incoming president felt that he needed to do more to shake the campaign characterization that he was uncomfortable in his role as commander in chief. Despite wanting to succeed and prove himself, Clinton also wanted to quickly hand over the main responsibilities for the continuing mission in Somalia to the United Nations. To this end, UNSC Resolution 814 was unanimously passed on March 26, 1993, and UN Operations in Somalia II (UNOSOM II) commenced. Acting under Chapter VII of the UN Charter, and because state sovereignty in Somalia had completely broken down, an extension of peacekeeping/peacemaking operations until October 31, 1993, was enacted.

Resolution 814 was a watershed resolution for the United Nations in terms of declaring the instability in Somalia to be an international threat to security and authorizing aggressive use of force to achieve very broad economic, social, and political goals. Resolution 814 was a nation-building mandate in Somalia, but because Clinton desired that U.S. troops leave Somalia as soon as possible, it was heavily focused—at least initially—on disarming the rival warlords and creating and enforcing a cease-fire. One of the most fateful decisions made by the Clinton administration during UNOSOM II was to

remove 25,000 combat troops. This, coupled with a startling lack of armor capabilities (both tanks and armored personnel carriers), made the most aggressive and dangerous phase of the UNOSOM mission that much more difficult.

After a series of particularly aggressive attacks by Aidid's forces in August 1993, one of which resulted in the deaths of four U.S. Army military policemen, Clinton decided to ramp up the effort to capture or kill Aidid over the protestations of Marine General Joseph Hoar, who was in charge of Central Command operations. Hoar worried that the odds of capturing and killing Aidid were low, but he also worried that even if Aidid were captured, another brutal warlord would simply fill the void created and nothing on the ground would change.

But these worries fell on deaf ears, and Clinton ordered in a special operations force consisting of Delta Force commandos, a helicopter detachment, and Army Rangers whose main mission it was to capture or kill Aidid. Once aggressive, offensive missions began—which included operations such as bombing suspected weapons caches, attempts to control the local media, mass arrests, and targeted attempts to capture or kill Aidid—the UN mission had inadvertently taken a side in the Somali civil war. The mission creep extended past the formal mandate contained in UNSC Resolution 814, justifying Aidid's fears that the UN mission was actually aimed at removing him from any sort of political or power position in a postconflict Somalia.

Aidid continued to ramp up the pressure on the UN mission and the U.S. leadership by indirectly attacking affiliated peacekeepers. In a particularly heinous attack on June 5, 1993, 24 Pakistani peacekeepers were killed by a mob of Aidid's supporters. This sent shockwaves through the United Nations as peacekeepers had previously been considered off limits as targets. The response was particularly heavy-handed, and if the UN forces had not been formally involved in the Somali war previously, it became more difficult to deny involvement as the U.S. and coalition forces went on an all-out offensive against Aidid and his supporters.

Because of the lack of armor support, Black Hawk helicopters increasingly became comfortable staying low to the ground after a force drop and providing air cover fire. Aidid and his military advisors noticed this and identified the Black Hawks as a prime target for attack. For the first

time, Aidid was willing to attack U.S. forces directly as he thought that if he could bring one Black Hawk down, U.S. forces would rush to aid the victims of the crash and his forces could concentrate fire on the exposed American forces. Not only was he correct, but the operation on October 3, 1993, resulted in two downed Black Hawks and a stand-off with American forces that lasted most of the next day.

At the end of the 2-day debacle, 18 U.S. soldiers were dead, with dozens more wounded, and hundreds of opposing Somali forces were killed, with more than 1,000 wounded. While the losses were surprising and horrific for the United States, they were not sufficient to halt operations. However, Aidid had also successfully divined the mood of the American public and how to manipulate it through CNN and other news sources. Aidid orchestrated his supporters to drag dead U.S. soldiers in front of news cameras in an attempt to shock the American public and American leaders into withdrawal. The media operation worked, and President Clinton ordered the immediate withdrawal of all remaining U.S. forces. The UN mission ended in 1995, and although Aidid “won the day,” Somalia has never recovered and remains the ultimate example of a failed and fractured state.

Lessons From Somalia

The lessons learned from Somalia are many. The immediate American public policy takeaway from the Somalia peacekeeping/enforcement missions was that Africa was to be avoided militarily. This resulted in what some have dubbed a “Somalia syndrome”—causing U.S. policymakers to avoid intervening in the genocide in Rwanda.

Operationally, there was a stark lesson learned regarding peace enforcement missions. These missions will be difficult, require vast military resources, and cannot be constrained by a timetable. Furthermore, fewer troops and almost no armor support were provided for the peace enforcement phase of the mission. This resulted in a severe operational constraint that increased the risks inherent in UNOSOM II, which had a far wider list of operational and strategic goals than UNOSOM I or the UNITAF mission. Therefore, one can conclude that peace enforcement missions should only be undertaken when the nation-states involved believe that

they have a pressing national interest in alleviating the problems associated with an ungoverned state and where the American public shows the political will to support the mission until completion.

A final lesson that can be gleaned from the Somalia mission is the importance of information operations and public affairs. Aidid understood the American mood and how to manipulate this mood through the international media far better than the American and UN forces did. This allowed him to use dead U.S. soldiers as an effective lever to end the foreign military presence in Somalia.

SOUTH AMERICA

The South American continent is a geographically diverse region consisting of 12 independent states and one European dependency. Nine states are Spanish speaking, one Portuguese, one English,

and one Dutch, while the European dependency is French speaking. Although these are the dominant languages in each state, the picture is complicated by a host of indigenous languages and a few creoles. The geography of the region ranges from the high Andes through several lower ranges, highland plateaus, and deserts to the tropical rainforests of the Amazon River and its tributaries. Climate varies mostly with altitude but also, to a lesser extent, with latitude. In addition, there are the grasslands of the pampas in the southern part of the continent and the llanos in the north. Indigenous Amerindians are found throughout the region, ranging from the descendants of the high Andean civilizations of the Incas and their Aymara allies to small tribal groups found in the tropical rainforests. Perhaps a majority of the people of the region are descendants of the Spanish and Portuguese colonizers and Amerindians known as mestizos, or mixes with the descendants of African slaves or with other Europeans. The minorities are European in most countries, although there are also populations of Chinese, Japanese, and East Indian ancestry. This entry examines the culture, politics, armed forces, civil-military relations, recent history, and interstate conflicts of the countries of South America.

Basics of the Region

There are several ways of viewing South America. First, one can consider it as being made up of several, somewhat overlapping, subregions based on geography and political-economic relationships. The five subregions are as follows:

1. The Andean Ridge, consisting of Venezuela, Colombia, Ecuador, Peru, Bolivia, and Chile, all of which are, or have been, member states of the Andean Group
2. The Southern Cone, made up of Argentina, Chile, Uruguay, and Paraguay
3. Brazil, a region unto itself
4. The Guiana Highlands, consisting of Guyana, Suriname, French Guiana (the sole European dependency in South America), and parts of Brazil and Venezuela
5. The Amazon Basin, made up of parts of Bolivia, Peru, Ecuador, Colombia, Venezuela, the Guianas, and Brazil

A second way of looking at the region is culturally. This follows the concept of the great Peruvian political thinker and leader Victor Raul Haya de la Torre, who saw South (and indeed all of Latin) America in terms of its indigenous roots. Haya called the region *Indo-America*, but the term in South America really applies only to Peru, Bolivia, Ecuador, and Paraguay, where indigenous languages are widely spoken either by significant pluralities or by a majority of the population. The rest of the region is generally dominated by the Mediterranean variant of European culture, with varying degrees of African and indigenous influence.

A third way of considering the region is in terms of political groupings. Here, one finds the Bolivarians—countries influenced by Hugo Chavez's Bolivarian Revolution and its 21st-century socialism. Strongly entrenched in this group are Venezuela itself, Ecuador, Bolivia, and Paraguay (although the last of these is also significantly influenced by the second group). The second group is best described as the "democratic left," including Brazil, Peru, and Uruguay. Argentina flirts with this group and the Bolivarians. Chile and Colombia are very much democratic in their behavior, while Chile has recently moved from the center-left to the center-right in its policies, and Colombia is firmly following a center-right approach. The outliers are the Guianas, whose culture is quite different from that of the other countries of the region.

The security organization of all the states of the region, with the exception of Brazil, is similar. While all have traditional armed forces of varying size, all but Brazil also have a national police force that is organized along paramilitary lines, whether it is called the *policia nacional*, *Gendarmeria*, or *Carabineros*. Brazil differs in that its regular police are state entities, but they too are organized along paramilitary lines as *policia militar*.

Recent Historical Developments

Exactly when one dates recent historical developments in the region depends very much on what is being emphasized. In South America, a good place to start is the beginning of the return to democracy in the region following the major military interventions in the 1960s. In 1975, Venezuela and Colombia were the only independent states in South America governed by freely elected leaders. Venezuela had

become democratic in 1958 for the first time in its independent history. By contrast, neighboring Colombia had been more or less democratic since independence, having suffered only three military coups in its history. The last one, in 1953 by General Rojas Pinilla, was called for by all political parties as a way to end the civil war, known as *La Violencia*. Military rule was ended in 1957 (although the civil war “continues” to this day).

South America began its return to democracy in 1978 when Ecuador inaugurated a democratic government. Peru followed in 1980, Argentina in 1982 (after the Falklands/Malvinas war), and Brazil in 1985, followed by several others. Then, in 1988, Chile held a plebiscite over whether President Augusto Pinochet should be allowed to continue in office. Led by the Christian Democrat Patricio Aylwin, the “campaign for the ‘No’” won resoundingly. General Pinochet decided not to run in a competitive election, and Chile returned to the democratic fold. By 1990, all of South America was under democratic rule.

South American Interstate Conflict

Although South America is one of the world’s most peaceful regions, with only three major interstate wars since independence, it has fought a number of interstate, small-scale border wars and one significant war with an extraregional power in the recent past. Moreover, there have been several potentially major conflicts that were barely avoided since 1978. In that year, Argentina and Chile very nearly went to war over the islands in the Beagle Channel, and the conflict only subsided through papal intervention. In 1980, Peru and Ecuador renewed their border war over their *Cordillera del Condor* boundary in the Amazon area. This fight nearly included a major Peruvian air campaign against Ecuador’s cities, but for the diplomatic intervention of the Brazilian and American ambassadors to Peru directly with President Fernando Belaunde, who ordered the Peruvian air force to stand down.

In 1982, there was the Falklands/Malvinas war between Argentina and Great Britain, which began with the Argentine invasion of the British possessions of South Georgia and the Falklands and ended with the retaking of Port Stanley by the British commandos after amphibious landings on the islands and significant air and sea combat. This involved

the loss of several British warships and one of Argentina’s major surface combatants, the cruiser *General Belgrano*, to torpedoes launched by the British nuclear attack submarine, HMS *Conqueror*. This action by the British just outside their declared “exclusion zone” caused the Argentine aircraft carrier, *Dos de Mayo*, to return to its base and likely cost Argentina the war. The other consequence of the war was the fall of the military dictatorship and Argentina’s return to democracy.

In January 1995, the war between Ecuador and Peru resurfaced. Unlike the previous iterations, it did not threaten to expand beyond the border fighting. Still, this was quite intense but resulted in enough of an Ecuadorian victory to give that country the confidence finally to settle the dispute diplomatically. A peacekeeping operation conducted by the four Guarantor Powers (Argentina, Chile, Brazil, and the United States) incorporated both Peruvian and Ecuadorian officers, helping to make the settlement on the ground support the diplomatic negotiations in Brasilia.

In March 2008, Colombian troops entered Ecuador, striking a base camp of the Fuerzas Armadas Revolucionarias Colombianas (FARC), killing a senior FARC leader, Raul Reyes, and seizing his laptop computer. The files in the computer made it clear that not only was there a FARC sanctuary in Ecuador but there were also sanctuaries in Venezuela and that Chavez was providing support and sustenance to the FARC. Both Ecuador and Venezuela mobilized forces on their borders with Colombia, but no fighting broke out. Moreover, Ecuador began to take steps to make certain that the FARC ceased using Ecuadorian territory as a sanctuary. Two years later, the Colombian government released more captured intelligence implicating Venezuela in supporting the FARC monetarily with arms and with sanctuaries. Venezuela cut off diplomatic relations and again mobilized its forces, but after a meeting between the newly inaugurated Colombian president Juan Manuel Santos (the immediately previous defense minister) and Chavez, diplomatic relations were restored, and the Venezuelan military stood down.

Insurgencies and Other Intrastate Conflicts

The oldest, most tenacious, continuing insurgency in South America is that in Colombia—the country

with the longest history of democracy in the region but also with the longest history of internal war. Since independence in the 1820s, Colombia has only known 44 years of internal peace, between the end of the War of 1000 Days in 1902 and the beginning of *La Violencia* in 1946. The latter, which began as a civil war between the traditional political parties of Colombia, the Liberals and the Conservatives, escalated explosively after the riot known as the *Bogotazo* in 1948, then degenerated into banditry with political overtones after the Rojas Pinilla coup in 1954, and surged again in Marxist-Leninist form with the founding of FARC in 1962. This war has been continuous ever since.

The FARC insurgency in Colombia has seen numerous ups and downs, twists and turns, and has been complicated by other Marxist-Leninist insurgencies, the most important of which is that of the Ejercito de la Liberacion Nacional, along with nongovernmental counterinsurgents whose formal name was Autodefensas Unidas Colombianas, more generally known as paramilitaries. In addition, there have been several cocaine cartels in the game, and none of these groups are mutually exclusive. Currently, the Autodefensas Unidas Colombianas has laid down its arms, the Ejercito de la Liberacion Nacional is largely neutralized, while the FARC is on the defensive but in a strong alliance with some of the cocaine cartels.

The second major insurgency in South America is that of the Shining Path (Sendero Luminoso, SL) in Peru. Founded as a faction of the fractionated Communist Party of Peru in the 1960s by the head of the Education Program at the National Autonomous University San Cristobal de Huamanga in Ayacucho, Abimael Guzman, SL began a decade-long recruitment before it launched its first armed action in 1980. For the next 12 years, SL expanded its activities in the highlands, in the coastal cities (especially Lima), and in the coca-growing Upper Huallaga Valley. A combination of reoriented army strategy and tactics, support for volunteer rural militias called Rondas Campesinas, and effective intelligence work by the National Intelligence Service and the National Police's National Counterterrorism Directorate, coupled with major SL errors, brought about the capture of Guzman and other members of the leadership in September 1992. The capture of Guzman quickly resulted in the disintegration of most of SL. However, remnants remained active in

the highlands around Ayacucho, while SL's Huallaga Regional Command continued to operate largely untouched and, indeed, expanded operations as it entered into agreements with Colombian cocaine cartels—agreements that Guzman had forbidden in the past. Nearly two decades later, SL has reemerged as a political and military force, although it is yet to achieve the level of threat it once had. On the other hand, the Peruvian military and police no longer have the highly developed capabilities that allowed them to defeat SL in 1992.

Other Security Threats

Colombia, Peru, and Bolivia all face significant threats from well-armed cocaine traffickers. As noted, in the first two cases, these bleed over into the ongoing insurgencies. Brazil has serious problems with major criminal gangs that have ties to the favelas (slums on the hills surrounding the major cities). On several occasions, the Brazilian army has been brought in to restore order to these cities, which have been terrorized by criminal gangs in league with favela chiefs. Ecuador has seen its democratic government toppled by protests from indigenous groups, as has Bolivia. In both cases, these troubles led to the electoral victories of Presidents Evo Morales of Bolivia and Rafael Correa of Ecuador, both former allies of Chavez.

A remaining security threat is manifest in the Southern Cone in the zone known as the Tri-border Area (TBA), where Argentina, Brazil, and Paraguay come together. It is an area known for the absence of law and order and significant cross-border smuggling. Much of the commerce is in the hands of people of Lebanese descent, known as Turcos, most of whom were born in South America. It is, however, also an area where the Iranian- and Syrian-backed terrorist organization Hezbollah has been highly successful in raising funds. More ominously, Hezbollah has been linked to the 1992 bombings of the Israeli embassy and the Jewish community center in Buenos Aires.

Inter-American Relations

Inter-American relations, in the context of this entry, mean the relations between the United States of America and the states of South America. These relationships take place in a number of contexts: commercial, legal, criminal, economic, political,

and military. They are at once bilateral and multilateral. For the United States, bilateral relations are conducted between governments by their embassies in Washington and the various national capitals. However, U.S. military relations with South America are coordinated through the U.S. Southern Command, with its headquarters in Miami, Florida. Multilateral relations generally are conducted through the Organization of American States and other international, intergovernmental organizations such as the United Nations and its family of specialized agencies.

U.S. bilateral relations with South American countries since 1989 have generally (a) supported the transition to democracy that took place there, (b) resisted military interventions in civilian governments, and (c) focused on addressing the problems caused by the production and smuggling of cocaine. The end of the Cold War by the early 1990s reduced the problem of potential communist subversion and insurgencies, with the exceptions already noted.

The Reagan administration first declared drug trafficking a national security issue with National Security Decision Directive 221 in 1986. This was followed by Operation Blast Furnace in Bolivia that summer, which was a combined Bolivian-U.S. counterdrug operation that on the American part was interagency, with the Drug Enforcement Administration and U.S. Southern Command participating. This was followed by President George H. W. Bush's National Security Directive 18 in 1989, which called on all U.S. unified commands to develop counterdrug plans. The U.S. Southern Command developed both an operations plan and a campaign plan that it implemented with major emphasis on Colombia, Peru, and Bolivia. Plan Colombia during the Clinton administration attempted to provide major development assistance from both the European Union and the United States, as well as the majority of funds from Colombia itself. Because the European Union tended to focus on civilian projects, the United States aimed its assistance toward security. Unfortunately, the European Union did not meet its commitments, so the program was perceived as largely security focused. The George W. Bush administration continued Plan Colombia and raised its support for President Alvaro Uribe in his fight against both drugs and insurgents.

The generally perceived failure of what was dubbed the "Washington Consensus" of the 1990s caused an electoral backlash throughout South America, with left-of-center parties winning control

of governments in Venezuela, Ecuador, Bolivia, Argentina, Brazil, Paraguay, and Uruguay. Of these, Venezuela, Bolivia, Ecuador, and Argentina consistently expressed anti-U.S. rhetoric and took anti-U.S. positions in international fora. Brazil, while not opposing the United States rhetorically, has followed a very independent foreign policy. Similarly, Chile opposed the United States in the United Nations on the issue of Iraq policy.

Civil-Military Relations

Throughout South America's independent history, the principal question of civil-military relations has been how to bring the armies under civilian control. Failure to do this resulted in military governments alternating with elected civilian ones from the 1820s to the 1980s. Occasionally, civilians seized power by force but nearly always with military support. Likewise, military coups were supported by civilian politicians. Since 1958, there has been a gradual shift toward civilian rule, even when the civilians were less than wholly democratic.

The last military governments in South America to leave office were those of Chile in 1989 and Paraguay in 1992. Unfortunately, that was not the end of the *golpe de estado* (coup d'état). In 1992, President Alberto Fujimori of Peru conspired with his de facto intelligence chief, Vladimiro Montesinos, and the commander of the army, General Nicolas de Bari Hermosa, to mount a coup against his own government. This *autogolpe* reintroduced authoritarianism into Peru, which lasted until Fujimori's third election as president was perceived as fraudulent and Montesinos was captured on video giving cash bribes to members of Congress. The Fujimori regime ended in 2000 with a return to democracy.

While the military in Ecuador played a major role in some of the political unrest in that country from 1997 until 2005, its role was mixed. However, the military never did take power for itself. The most egregious military interventions were in Venezuela, where in 1992, Lieutenant Colonel Chavez attempted a coup against the constitutional president, Carlos Andres Perez. Arrested, convicted, and jailed, Chavez was released early and ran for president, winning in 1998. In 2002, military and civilian leaders briefly overthrew Chavez, who was, however, returned to power by loyal military officers and ruled until his death in 2013. During this time, President Chavez gradually turned the country into a significantly more authoritarian regime.

The rise of democratic governments over the past two decades has clearly had an institutional impact on South American civil-military relations. Closely related to this development is the establishment and maintenance of a professional civil service in all government agencies, not only defense. The region long suffered with weak or nonexistent civil services, so much so that in many countries the only professional national public service was the uniformed military. Since 1990, there has been a conscious effort in many, if not most, South American states to establish defense ministries with civilians in the chain of command and in responsible positions. Today, all the countries of South America, except Guyana, have a Ministry of Defense; in most, the minister is a civilian, and in all but three, the minister is in the chain of command. Only four countries have vice ministers, and only two of them are in the chain of command. Similarly, only two vice ministers are civilians, but only in Bolivia is the vice minister both in the chain and a civilian. Again, most of the countries of the region have established Joint Staffs within the ministry, subordinate to the minister. Eight of the countries have created civilian positions within the Ministry of Defense that have policy responsibilities. Nevertheless, a majority are handicapped by the weak or nonprofessional civil service situation. Despite this, what we see is a significant increase in the subordination of the military to the civilian government over the past 20 years.

This subordination has led to two significant changes: one structural, the other in employment. Structurally, nearly all the militaries have dropped conscription and now rely on volunteers, which has reduced the size of the military. South American militaries since the end of the Cold War have been employed much more extensively in peacekeeping operations, with Argentina, Brazil, and Chile taking the lead. This was especially evident in the organization of the 2004 Haiti operation MINUSTAH (United Nations Stabilization Mission in Haiti), in which most of the countries in the region volunteered forces.

Prospects for the Future

Trends identified in this entry are the following:

- Long-term institutionalization of democracy with, however, significant setbacks
- Reduction of insurgencies but increase in lawlessness, especially related to drug trafficking

- Continued low incidence of interstate war, with even less likelihood in the future
- Greater integration of the region into the global system, with more independence from the United States, especially by Brazil as a regional leader
- Civilianization of defense, resulting in smaller, more professional militaries, and significant civilian participation in and command of defense establishments
- Increased involvement in international peacekeeping

SPACE

Human beings have dreamed of exploring space for centuries, but the realization of that vision in the 20th century had its roots in military thinking. From the rocket technologies developed in Germany during World War II to the use of satellite imagery and communications during the Global War on Terrorism, space exploration and the military have repeatedly intertwined. This entry discusses the links between the U.S. military and technological innovations related to the space program.

These connections began early in the Cold War. After 1945, the Soviet Union and United States vied

Astronaut Edwin E. "Buzz" Aldrin Jr., Lunar Module pilot, is photographed during the Apollo 11 extravehicular activity on the moon. He has just deployed the Early Apollo Scientific Experiments Package. In the foreground is the Passive Seismic Experiment Package; beyond it is the Laser Ranging Retro-Reflector; in the center background is the U.S. flag; in the left background is the black-and-white lunar surface television camera; and in the far right background is the Lunar Module "Eagle." Astronaut Neil A. Armstrong, commander, took this photograph with a 70-millimeter lunar surface camera.

for the services of German scientists and engineers who had developed V-2 rockets for the Nazis during World War II. The Americans successfully lured Wernher von Braun and others to come to the United States to bolster the nation's munitions program. He soon envisioned using rocket technologies to send human beings and spacecraft into the cosmos, but these dreams also had implications for the Cold War rivalry with the Russians. Satellites might perform military reconnaissance missions, and exploration of space could lead to celestial military bases or colonies. In the 1950s, both sides sought symbolic victories along the way to these goals, launching a "space race" that showcased Soviet and American technologies before the eyes of the world.

Many of these early triumphs went the Soviets' way. They launched *Sputnik*, the first orbiting satellite, in 1957. President Dwight Eisenhower, though confident of American missile superiority and unimpressed by space gadgetry, faced pressure to support the creation of the National Aeronautics and Space Administration (NASA) the following year. Although NASA is a civilian agency, it maintained strong ties with the military; all the astronauts who journeyed into space until 1972 served with the U.S. armed forces. Eisenhower's more aggressive successor, John F. Kennedy, declared in May 1961 that the United States would land a man on the moon before the end of the 1960s. The pledge materialized in the wake of the embarrassing debacle at the Bay of Pigs

The United Launch Alliance Delta II rocket carrying the Space Tracking and Surveillance System–Demonstrator (STSS-Demo) spacecraft as it leaps into the sky from Launch Pad 17-B at Cape Canaveral Air Force Station. STSS-Demo was launched at 8:20:22 a.m. Eastern Daylight time by National Aeronautics and Space Administration for the U.S. Missile Defense Agency. The STSS-Demo is a space-based sensor component of a layered ballistic missile defense system designed for the overall mission of detecting, tracking, and discriminating ballistic missiles. STSS-Demo is capable of tracking objects after the boost phase and provides trajectory information to other sensors.

in Cuba and the first successful space flight of the Soviet cosmonaut Yuri Gagarin.

With that mandate, NASA procured big budgets to develop technologies and techniques to reach the moon in several stages. Alan Shepard was the first American in space in May 1961, John Glenn the first American to orbit the earth in February 1962, and Ed White the first American spacewalker in June 1965. A year and a half later, at the start of the Apollo program that would send manned missions to the moon, the space program suffered a tragic setback when Gus Grissom, Ed White, and Roger Chaffee died in a training accident. Nonetheless, the program proceeded. In the Apollo 8 voyage of December 1968, Frank Borman, Bill Anders, and

Jim Lovell became the first human beings to leave the earth’s orbit and enter the moon’s. After two more test missions, NASA met Kennedy’s deadline by landing Neil Armstrong and Edwin “Buzz” Aldrin Jr. on the moon’s surface on July 20, 1969, as Michael Collins orbited overhead. Though President Richard M. Nixon declared the accomplishment a unifying moment for humankind, he surely relished the Cold War victory. Nevertheless, in a sign of Cold War détente, the adversaries later docked two manned spacecraft in the Apollo-Soyuz Test Project of 1975.

The Cold War thaw did not last long, and when hostilities intensified under President Ronald Reagan in the 1980s, so did the militarization of

space. On March 23, 1983, Reagan announced his commitment to a national defense system designed to protect the United States from nuclear attack. The program, known as the Strategic Defense Initiative, included plans for a space-based missile defense shield that would shoot down incoming ballistic missiles with laser beams—thus earning the nickname “Star Wars.” Supporters of the plan argued that it would eventually render nuclear weapons obsolete, Reagan’s broader goal, once the technology was shared with the Soviets. Critics worried that it would lead to a new arms race, was technically unfeasible, and would cost billions of dollars when social spending was in decline. Though the program continued under other names and in more modest forms after Reagan’s presidency, the end of the Cold War in 1991 lowered the stakes, and the space-based defense shield never came to pass.

By the 1990s, the U.S. military was incorporating the space program’s technological innovations into its operations, with some observers calling the 1991 Persian Gulf War the first space war. In that conflict, the military’s Space Command used orbiting satellites to help ground troops navigate the desert sands of Iraq and to detect the launch of Iraqi Scud missiles. Satellites also facilitated better combat communications and weather prediction, while affording views of enemy positions and enabling poststrike damage assessments. Yet much of this technology was still experimental and imperfect at the time of the Persian Gulf War.

After the terrorist attacks of September 11, 2001, improved space-based technology became central to military thinking. Satellites orbiting the earth provided all manner of military applications for the Global War on Terrorism and the campaigns in Iraq and Afghanistan. Intelligence gatherers used satellite imagery to locate suspected terrorists operating around the world. American ground troops used Global Positioning System satellites to navigate combat zones; the same satellites directed unpiloted drones and missiles toward targets in remote areas. The Defense Satellite Communication System offered wide-ranging communications capabilities.

Of course, America’s increasingly sophisticated enemies have tried to counter these advantages. Iraq attempted to block Global Positioning System signals during the 2003 war, and the Defense Department started developing Global Positioning System antennas that could avoid jamming. In the

future, conflicts will doubtless hinge on just such battles of technology, with much of it operating far above the earth.

SPANISH-AMERICAN WAR (1898)

The 1898 Spanish-American War pitted a burgeoning world power, the United States, against the fading Spanish empire, primarily over the Spanish colony of Cuba. This entry examines the origins, naval and ground battles, and consequences of the Spanish-American War.

Cuba and Puerto Rico were the two last outposts of a Spanish empire in the Western Hemisphere that had once scaled almost all of Central and South America. Spain had lost most of its possessions in the first half of the 19th century, and from 1868 to 1878, a native Cuban independence movement had challenged Spanish rule. Spain clung to the island, using strong military force to quell the rebellion. For its part, the United States had since the promulgation of the Monroe Doctrine in 1823 dedicated a significant portion of its foreign policy to the limitation or removal of European influence from the hemisphere but had held off from direct military confrontation until the circumstances allowed for more decisive action in the later decades of the 1800s. Activities in Cuba provided just such an opportunity. Beginning in 1895, a new Cuban independence movement under leaders such as José Martí, Máximo Gómez,

and Antonio Maceo managed to build up enough momentum so that the Spanish felt compelled to use harsh measures to suppress the rebellion. Under General Valeriano Weyler, the Spanish began concentrating the Cuban population into camps to separate civilians from insurgents. Many Americans already sympathized with the Cuban insurrection, and the terrible conditions in the camps only garnered more support in the United States for independence.

The United States kept a close watch on events in Cuba, and as part of that effort, it sent naval vessels to protect Americans and American interests in Havana. On February 15, 1898, an explosion rocked one such vessel, the USS *Maine*, and it sank, taking more than 200 American sailors with it.

The explosion was most likely an accident, but in the heated politics of the day and spurred on by an excitable press, many Americans blamed the Spanish for the sinking of the *Maine*. President William McKinley, who had long been trying to help negotiate an amicable end to the fighting in Cuba, now felt compelled by public pressure to take a harder stance, demanding that Spain grant Cuba outright independence. The Spanish refused, and in late April 1898, the United States declared war.

Conflict

The war itself was fought in three theaters—the Philippines, Cuba, and Puerto Rico—all with naval and ground components. The fighting in the Philippines began with the May 1, 1898, Battle of Manila Bay, during which a U.S. Navy squadron under Commodore George Dewey wiped out the Spanish fleet at the Philippines capital. Dewey followed his victory by watching and waiting while a native Filipino insurgent movement pressured the Spanish ground forces around the city itself. McKinley dispatched the Eighth Army Corps under General Wesley Merritt to follow up on Dewey's efforts, and Merritt's forces arrived in theater and landed forces south of Manila in July. Thereafter, his forces worked their way past the Filipino insurgents and in August fought a largely symbolic battle with the Spanish to take Manila itself, as the Spanish forces on the ground fought just enough to maintain their dignity before capitulating. As the Americans and Spanish negotiated a peace that would ultimately exclude the Filipino insurgents, Merritt's men effectively stepped into a besieged city and would have to fight their way out once the war morphed into the Philippines Insurrection in early 1899.

The main action in the Spanish-American War happened in Cuba itself. The geography, economy, and racial divisions of Cuba had significant effects on the course of the Cuban Revolution. Put simply, the Spanish, especially after Weyler's efforts, exerted far greater control on the western half of the island, including around the city of Havana. The revolutionaries had more influence in the east and in 1898 were harassing Spanish contingents throughout the region. For their part, and in an effort to secure the civilian population against the insurgents, the Spanish broke up their forces into smaller units distributed throughout the countryside.

Not wanting to confront the Spanish in their area of strength in the west, the Americans decided to land their forces on the southeastern portion of the island. When the main Spanish fleet under Admiral Pascual Cervera crossed the Atlantic and put in at the southeastern port city of Santiago de Cuba in late May, the target of American operations became more specific. The American fleet under the overall command of Admiral William Sampson blockaded Cervera in the port, and the Fifth Army Corps under General William Shafter headed toward the city to pressure the Spanish fleet from the land. After consulting with the Cuban revolutionaries, Shafter landed his forces east of Santiago at Daiquiri and Siboney in late June. From there, he sent his 17,000-man corps, divided into three divisions, northwest

toward the main Spanish defensive positions at San Juan Ridge, the high ground east of Santiago. To the northeast of San Juan Ridge, Spanish forces at the heights at El Caney threatened the right flank of the American advance, so Shafter broke off one of his divisions to eliminate the threat. That division, under General Henry Lawton, struggled against the outnumbered but well-entrenched Spanish troops, which forced Shafter to assault San Juan Ridge with only the remainder of his force on July 1.

Once again, the Americans had a decisive advantage in troops and materiel, but once again, the Spanish fought well and inflicted heavy casualties on the assaulting forces. Still, aided by timely support from a battery of Gatling machine guns, the two American divisions swarmed up the heights

and cleared out the Spanish defenders. Although the First U.S. Volunteer Cavalry Regiment, Theodore Roosevelt's Rough Riders, eventually received much of the credit for their efforts on the extreme right of the American assault, all of the American units involved played their part in winning the Battle of San Juan Hill. In the aftermath, Shafter surrounded Santiago, and Cervera's fleet had to try to run the American blockade. On July 3, Cervera tried to take his six ships out of the bay, but the American ships completely destroyed the small fleet in short order. The Fifth Corps laid siege to Santiago, which formally surrendered on July 17, ending the major action in Cuba.

The subsequent fight for Puerto Rico proved anticlimactic, as the more than 15,000 men under General Nelson Miles landed in late July and, facing little resistance from the 7,000-man Spanish contingent, controlled almost the entire island until the August 12 armistice halted the fighting. In the meantime, American and Spanish diplomats began the long process of negotiating the peace, which culminated with the Treaty of Paris, 1898 (ratified in April 1899). The treaty provided for (a) the independence of Cuba, (b) the cession of Puerto Rico and Guam to the United States, and (c) the cession of the entire Philippine archipelago to the United States for a payment of \$20 million. In less than 5 months of fighting, the Spanish-American War spelled the effective end of the Spanish empire in the Western Hemisphere and the Pacific and a significant expansion of American power and influence on the world stage. No wonder that at the time, the American statesman John Hay called it a "splendid little war."

Consequences

The luster quickly came off of the fight, because the Spanish-American War introduced a number of important controversies, some of which continued for generations after the war's end. The acquisition of the Philippines, and the bloody and highly politically contentious insurrection that followed, was just one of the unintended consequences of the fight. The United States also had to figure out how to handle its new territories and responsibilities, especially with regard to Cuba. The original declaration of war had included the Teller Amendment, which swore off any designs of the United States to annex the island. The amendment had emerged out of a

combination of anti-imperialist sentiments and considerations of local American politics and economics, but it did not reflect the totality of American ambitions. Many Americans wanted to take some territory in Cuba, control the island directly, or at least feel a responsibility to ensure its stability. So as part of the peace process, the Americans took control of the port at Guantanamo Bay and built the facility into a significant naval base, which the United States holds to this day. Even as Cuba transitioned from military government toward independence, the Americans formalized their partial control over Cuba in the form of the 1901 Platt Amendment, which allowed the United States to intervene in Cuba in the event of instability or a foreign threat to the island. A tendentious relationship ensued, replete with interventions and various diplomatic crises, and Cuba remains an important area of concern for the United States. In the short term, the difficulties attendant on expansion in both the Pacific and the Caribbean led most in the United States to back away from the imperial ambitions that had helped trigger the fighting.

Concerning military matters, it would seem that the rapid American victory would have led to mostly positive feelings within the military, but despite an initial spike in patriotic fervor and enthusiasm, the good feelings did not last for long. The army struggled mightily in organizing and equipping troops for overseas operations, especially in the tropical climes of Cuba and the Philippines. Malaria, yellow fever, and dysentery ravaged army units during the siege of Santiago, and even worse, widespread disease struck the facilities holding troops that could not be transported overseas and became packed into the southeastern United States. The army came under criticism for material shortfalls, inappropriate or outdated equipment and gear, insufficient or subpar food, and scandals in procurement. In truth, the army and the War Department had their fair share of difficulties, but they improved quickly as the war went on and did fairly well considering how far they had to go in such a short time.

Interestingly, military reformers, especially on the army side, fed into the negative perception, sometimes to the point of exaggeration. For them, the Spanish-American War became useful as a case study of the preparedness movement, driving the need to reform the U.S. Army. Advocates of preparedness made the case that the victory had a lot more to

do with Spanish failures than American successes. Indeed, the war helped lead to significant reform in the War Department under Secretary of War Elihu Root, including the creation of a general staff and the opening of the Army War College.

For many years, the majority of the historical literature on the war either followed this line of argument or focused narrowly on Roosevelt, the Rough Riders, and the Battle of San Juan Ridge. More recently, scholars have emphasized other aspects of the conflict, including how race and gender helped trigger the war, and the internal dynamics of the Cuban war against Spain, but the military course of the war has not received as much attention. Nevertheless, for the military, as well as for the country as a whole, the Spanish-American War had in many ways ushered in the modern era.

SPECIAL FORCES, AIR FORCE

The U.S. Air Force (USAF) Special Operators provide U.S. forces with the ability to move personnel into contested areas as well as perform search-and-rescue (SAR) missions behind enemy lines “anywhere, anytime.” The U.S. Air Force’s Special Operations Command (AFSOC) is composed of more than 16,000 members, although the actual special operators make up a much smaller portion of the organization. In 2012, the current members of AFSOC included two active-duty wings, one reserve wing, one National Guard wing, and two overseas groups. This entry discusses the history, missions, and air assets of the USAF Special Operations Forces.

History

The AFSOC’s history dates back to the Second World War. The 1st Air Commando Group was established on March 29, 1944. General Henry H. “Hap” Arnold charged Lieutenant Colonels Philip Cochran and John Alison with the creation of the Air Commandos to support the guerrilla forces operating in Burma in early 1943. Cochran and Alison succeeded in training hundreds of men to operate as a highly efficient special operations force. The unit operated numerous aircraft, and its missions included scouting, medical evacuation, fighter sweeps, and insertion and extraction of personnel using Waco Gliders. The Army Air Forces also had special forces soldiers in the European theater of operations, called “Carpetbaggers,” who inserted and extracted guerrillas into Nazi-held France. These forces were especially important as the invasion of France drew closer in the spring of 1944, and special forces operators placed hundreds of men in the country to aid the French resistance. The end of World War II saw the inactivation of all Air Force Special Operations assets and units. This meant that there was nothing in place when the Korean War broke out in 1950.

The reestablishment of special tactics units within the air force occurred on an impromptu basis as different units fashioned special operations roles out of necessity during the Korean War. The first official USAF Special Operations squadron was activated in 1950 and went under the name Air Resupply and Communications Service (ARCS). The ARCS was

General Henry H. "Hap" Arnold.

Source: Artist: Rita Guzzi. U.S. Air Force Art Collection.

the USAF's primary special operations unit during the Korean War. The ARCS embraced many mission types, a majority of which reflect the mission types present in modern Air Force Special Operations Forces. However, as in World War II, the cessation of hostilities saw the inactivation of Air Force Special Operations units.

The Vietnam War saw the rebirth of Air Force Special Operations Forces and also the addition of new mission sets and weapon systems to carry them out. These specially trained units survive to this day as necessitated by USAF operational requirements. Aircraft losses during Vietnam gave rise to the use of special operations airmen who specialized in the rescue of downed U.S. aircrews. Specially outfitted HH-53 "Jolly Green" helicopters with aerial refueling capabilities provided by a unique C-130 aircraft and armed with multiple machine guns permitted them the ability to enter enemy-controlled regions and conduct SAR operations.

During Vietnam, a battle was also waged between the services regarding close air support (CAS). While

the air force shied away from producing a fully dedicated CAS platform, interservice rivalries forced the air force to adopt the mission, and as a result, the gunship came into being. The gunship, a modified cargo aircraft with multiple-side firing weapons of various calibers, able to bring an enormous amount of firepower onto the battlefield, first in the form of the AC-47 and later the AC-119 and AC-130, provided the needed CAS. As of 2012, the AC-130 gunship remains a basic, vital, and very popular part of the USAF Special Operations Force. Due to its highly specialized mission set and support of Special Operations Forces, the gunship falls under AFSOC rather than other CAS platforms that fall under the Air Combat Command. In the end, the Vietnam War saw the USAF codify and expand its special forces operations and assets into mission sets still used in the 21st century.

Operation Eagle Claw, the attempted rescue of hostages in Iran in 1980, highlighted the need for a unified command structure for Special Operations Forces across the services. Although the operation ended in total failure and resulted in the death of many rescue personnel, it did have positive effects. The raid, with its disorder and lack of centralized control between the various services participating in it, was one of the events that led to the passage of the Goldwater-Nichols Act, which reorganized the Department of Defense. It also led to the creation of the U.S. Special Operations Command, which would oversee the training, organization, and integration of all special forces units, including that of the USAF.

Air Force Special Forces Today

The modern-day AFSOC was activated on May 22, 1990. The command's motto is composed from the mottos of its two primary branches: "First there . . . that others may live." The contemporary air force has two primary types of special operations airmen. The first are Combat Controllers (CCTs): essentially air traffic controllers who have the ability to insert fixed-wing or rotary-wing aircraft into hostile or dangerous environments, mark landing zones for them, and guide assets in and out. The second, Pararescue Jumpers, more commonly called PJs, are special operators with the singular mission of retrieving personnel from hostile environments. Their insertion methods include

Air force HH-3E "Jolly Green Giant" (aka "Jolly Green") helicopters were used to rescue pilots downed in Vietnam or the South China Sea. The rescue craft cruises at speeds of up to 155 miles per hour and is capable of in-flight refueling.
Source: U.S. Air Force photo, 1967.

jumping or fast roping from helicopters or parachuting into dangerous and hostile environments to locate and subsequently treat friendly forces—typically a downed pilot. The training pipeline for air force CCT and PJ personnel is among the most intense and time-consuming regimens in the special operations community. It not only encompasses qualification courses for each career field but also includes multiple interservice schools as well as the navy's diving course and Army Airborne and Air Assault courses.

Air Force Special Operations also include Special Operations Weathermen—meteorologists tasked with the collection and analysis of mission-critical weather data in support of special operations. They

can be found attached to units across the branches of service. Finally, tactical air control parties also fall under the special operations rubric. Their primary role is to advise, assist, and control the use of CAS assets. The air force uses a number of specialized air assets to conduct its Special Operations Forces missions, including the AC-130 gunship, MH-53 Pave Low, MH-60 Pave Hawk, CV-22 Osprey, EC-130J Commando Solo, MC-130 Combat Talon I/II, and MC-130P Combat Shadow.

During the Panama invasion in 1989, all of the air force's special operations aircraft types participated in the invasion, and members of special tactics groups (both CCTs and PJs) were assigned as attached members with various other special operators. During the

A U.S. airman assigned to the 23rd Special Tactics Squadron, Air Force Special Operations Command, Hurlburt Field, Florida, heads toward the water after jumping from a C-130 Hercules aircraft during parachute training at Santa Rosa Sound, Florida, September 27, 2010.

invasion, the MC-130 Combat Talons air dropped Army Rangers and Combat Control Teams into drop zones at two airports, and the HC-130 Combat Shadows provided on-call aerial refueling for other rotary-wing assets during the opening night of the conflict. Numerous AC-130s provided cover as well. The MH-60 Pave Hawks shuttled conventional and Special Operations Forces around the cities and countryside, while the MH-53s provided transport as well as fire support for American troops. CCTs were also integrated with the Navy SEALs (sea, air, land) during the invasion, providing their unique capabilities for controlling air traffic in and out of Panama.

During Operation Desert Storm, USAF CCTs handled all of the air traffic at King Fahd airport during the buildup of the allied forces. They also coordinated combat SAR missions in MH-60 Pave Hawks and MH-53 Pave Lows, aiding in the rescue of several downed pilots.

U.S. Air Force Special Operations also played an important role during Operation Enduring Freedom. In March 2002, during Operation Anaconda, a

Navy SEAL team attempted to insert on top of the Takur Ghar Mountain. The aircraft was hit by a rocket-propelled grenade, causing Navy SEAL Neil Roberts to fall from the helicopter. The damaged helicopter was forced to make an emergency landing. USAF Combat Controller Technician Sergeant John Chapman immediately called for CAS and a combat SAR effort to retrieve Roberts. The special operators, including Chapman, landed and began a rescue effort by advancing on an enemy position. Intense small arms fire from all directions met the team, and Chapman was killed in an attempt to rush an enemy position. Chapman was posthumously awarded the Air Force Cross. A quick reaction force arrived a short time later. This team included four air force PJs. During the landing, the helicopter came under withering fire, including rocket-propelled grenades and machine gun fire, which killed and injured several members of the rescue force. Senior Airman Jason Cunningham administered first aid and relocated the wounded away from the helicopter, which was now in flames. During the

battle that followed, Cunningham continuously returned fire and provided on-the-scene assistance to the wounded. During the course of the firefight and while moving a fellow comrade out of harm's way, he was mortally wounded. Cunningham was posthumously awarded the Air Force Cross for his selfless act.

Most recently, in 2010, after the earthquake in Haiti, USAF CCTs coordinated all air traffic control operations at the heavily damaged Port-au-Prince airport. It is unlikely that the supplies and personnel would have accomplished their mission, or even been able to get into the country, without the skill and determination shown by the CCT members, who worked from a foldout table with portable radios in a field next to the runways. Moving into the future, USAF special operators will continue to be a vital part of all air force operations.

SPECIAL FORCES, ARMY

The U.S. Army's Special Operations Forces comprise a multifaceted group of units tasked with missions such as unconventional warfare, reconnaissance, and counterterrorism. Their wide-ranging skills therefore make them capable of carrying out any mission outlined under the wider special operations umbrella. The army's "Green Berets," as they are commonly known, have developed over the course of the 20th century and have become an integral tool of the modern American military. After discussing the history of U.S. Army Special Operations Forces, this entry describes the seven Special Forces Groups (SFGs), 75th Ranger Regiment, and Delta Force, and their roles.

History

The Army Special Forces, while officially created in 1952, can trace their heritage back to the Second World War and the Office of Strategic Services (OSS). The OSS, the Army Rangers, and other units all conducted missions later tasked to special forces units, and many of the men involved can be directly linked with the institutional creation of special forces. The OSS conducted or assisted in unconventional warfare operations in occupied France, Burma, and the Philippines. The Army Rangers provided all forms of direct action support in every theater, from leading frontal assaults to raiding behind enemy lines and even conducting rescue missions. Men from these units would be influential in the formation of the Army Special Forces.

The 10th SFG was created in June 1952, alongside the establishment of the U.S. Army Psychological Warfare Division in the burgeoning Cold War. Its first commander was Colonel Aaron Bank, who had served with the OSS in Europe. While the 10th Special Forces Unit did not participate in the Korean War, the army raised 17 Ranger companies and established the Army Ranger School at Fort Benning, Georgia.

The special forces underwent their greatest period of growth under President John F. Kennedy, who saw to the addition of four new SFGs and the creation of the JFK Special Warfare Center and School at Fort Bragg, North Carolina. It was during Kennedy's 1961 visit to the center that the special forces revived their traditional green berets from their World War II predecessors. While giving a tour to the president, Brigadier General William P. Yarborough wore the then unauthorized headgear. The president was so impressed and enamored with the men and ideas of the special forces that he allowed the iconic beret to become their official headgear, calling it "a symbol of excellence, a badge of courage, a mark of distinction in the fight for freedom" (Simpson & Rheault, 1983, p. 32). The newly empowered special forces would become one of America's primary weapons in the burgeoning Cold War.

Vietnam served as a defining period for the Army Special Forces as they conducted a wide range of special operations missions conflictwide. The early years of the conflict necessitated the extensive development of the Green Berets into training specialists. Primarily involved in unconventional warfare training and action, the special forces constituted the direct liaisons in internal defense initiatives, serving

as the point of contact between the U.S. military and the local, indigenous populations. The special forces provided direct-action support, conducting strike missions and raids deep within hostile territory. The Vietnam version of the Rangers served the dual roles of intelligence and direct action. They were referred to as LRRPs, which stood for Long Range Reconnaissance Patrols and was pronounced “Lerps.” The special forces were heavily involved with the Studies and Observations Group, which was responsible for conducting covert and special operations within North Vietnam and across other nations’ borders.

While Vietnam represents a high mark in the evolution of Army Special Forces, the 1970s are synonymous with ineptitude. The U.S. military as a whole suffered a considerable hangover from Vietnam. This is nowhere more evident than in the failed 1980 rescue attempt of the Americans taken hostage in Iran, named Operation Eagle Claw. This operation failed due to poor cooperation between

the services, inadequate planning, and a decline in the training standards among the special forces themselves. Following the debacle of Eagle Claw, American Special Operations Forces underwent reorganization and resurgence. This shift entailed a refocus on training and the establishment of a Joint Special Operations Command, which utilized the Army Special Forces as its primary weapon. The special forces resurrected their image through critically important actions during U.S. interventions in Panama, Colombia, and El Salvador. The U.S. Army Rangers and Delta Force publicly entered Somalia in 1992, in an example of U.S. Army Special Forces acting independently of conventional forces on a larger scale. Army Special Forces were among the first U.S. military personnel on the ground in both Afghanistan and Iraq. During both of these contemporary conflicts, the special forces have been responsible for the full spectrum of special operation roles but have mainly been engaged in conducting unconventional warfare in hostile and contested territory.

Organization and Structure

Since the army institutionalized the special forces in the early years of the Cold War, the main force element has been the SFG. As of 2011, there were seven SFGs in the army—five on active duty and two National Guard groups. Each of the groups is organized similarly: one command element, three or four mainline battalions, and one support battalion. Each SFG is assigned to a specific region of the world, in which it specializes. The soldiers are put through intensive language and cultural education courses to maximize their effectiveness in their particular region.

The 1st SFG is responsible for the Pacific Region. This gives the 1st SFG a possible area of operations

stretching from Australia up to the Korean Peninsula and then over to Sri Lanka. The 1st SFG is headquartered at Fort Lewis, Washington, and regularly falls under the U.S. Pacific Command. Its motto is “First in Asia,” and it has seen recent action in the Philippines, conducting unconventional warfare missions in conjunction with the Republic of the Philippines government and armed forces in an attempt to separate the population from, and eventually destroy, the terrorist networks present in the southern islands.

The 3rd SFG is nominally assigned responsibility over sub-Saharan Africa, but recently, it has been heavily involved in Afghanistan, Pakistan, and other Central Asian nations. Its motto is “From the rest comes the best.” In 2008, soldiers from the “3rd

Group,” as they are referred to, were involved in the intense 7-hour Battle of Shok Valley. There were 10 Silver Stars awarded to participants in this action—more than any other single battle since Vietnam.

The 5th SFG’s assigned region is the Middle East and Central Asia. The soldiers refer to themselves as the “Professionals” and their group as the “Legion.” The 5th SFG is perhaps the most decorated, with members earning 13 Medals of Honor during Vietnam alone. The Legion worked extensively with the Central Intelligence Agency during the conflict, originating the army’s involvement with the now infamous Studies and Observations Group. The 5th has been very active in current conflicts—supporting the overthrow of the Taliban government in Afghanistan in 2001 and assisting in the capture of Saddam Hussein in Iraq in 2003.

The 7th SFG is responsible for Latin America and the Caribbean. The 7th SFG earned its nickname as the “Devil’s Brigade” during its service in World War II, when it was the 1st Special Service Force, giving the 7th SFG the longest lineage. The 7th SFG was critically important to Operations Urgent Fury in Grenada and Just Cause in Panama. Through both of these operations, the 7th SFG conducted reconnaissance and direct-action missions behind enemy lines. Along with the 5th SFG, the 7th SFG has spent the most time in Afghanistan, which is evident from the “Devil’s Brigade’s” suffering more casualties than any other special forces unit.

The 10th SFG was the original SFG formed in 1952. Its area of responsibility is Europe and northern Africa, and its motto is simply “The best.” Originally, the 10th SFG began training North Atlantic Treaty Organization allied militaries in unconventional warfare tactics and strategies during the early years of the Cold War. It has continued this tradition of training in more current conflicts, training the militaries of multiple African nations in support of Operation Enduring Freedom. The 10th SFG and elements of the Central Intelligence Agency were the first American units into Iraq, where prior to the invasion they trained Kurdish tribes in unconventional warfare practices.

The 19th and 20th SFGs are both National Guard units and organized as complementary to the active-duty SFGs. These two are attached to the larger regions of the Pacific (19th) and Latin America (20th), to ease the burden of the 1st and 7th SFGs. Each of these groups is made up of National Guard volunteers from a multitude of states. In addition to

serving in their specific regions, these two groups, along with all the active SFGs, have served extensively in both Iraq and Afghanistan.

Each of the groups falls under the command structure of the overall theater commands assigned to each particular region. The army created the 160th Special Operations Aviation Regiment to properly support the SFGs and other Army Special Forces in the field. The special forces also answer to the U.S. Special Operations Command, which assigns missions to Special Operations Forces from all branches and is charged with interservice cooperation and coordination.

The 75th Ranger Regiment

The 75th Ranger Regiment as it exists today was formed in 1984 and is under the authority of U.S. Army Special Operations Command and U.S. Special Operations Command. The Rangers are rapidly deployable airborne light infantry organized and trained to conduct highly complex joint direct action operations in coordination with or in support of other special operations units of all the services. The Rangers’ motto and creed are “Rangers lead the way,” highlighting their ability to be among the quickest deployable forces in the army. The regiment can deploy one of its battalions anywhere in the world in as little as 18 hours. The Rangers are capable of executing a number of special operations missions, including airborne and air assault direct-action strikes, as well as acting in support of more conventional forces.

Delta Force

The 1st Special Forces Operational Detachment-Delta (1st SFOD-D), more commonly referred to as simply Delta Force, is one of the U.S. Army’s Tier-1 Special Operations Forces. Referred to internally as “The Unit,” Delta Force is the army’s premier counterterrorism unit. The unit falls under the special jurisdiction of the Joint Special Operations Command, alongside other elite units like the Navy’s SEAL (sea, air, land) Team Six. While specializing in counterterrorism, direct-action, and national intervention operations, this group is capable of undertaking and completing any special operations task. It is a unique unit, the most capable and versatile of the Army Special Forces units.

Delta Force’s structure and organization are highly classified, with a membership numbering

somewhere between 800 and 1,000. The soldiers of Delta Force are almost universally recruited from SFGs and the Ranger Regiment, with approximately 70% coming from the Ranger ranks. A soldier who successfully survives the brutal training regimen and graduates is henceforth referred to as an *operator*, a term strictly reserved for those in Delta Force. While a large portion of the SFGs' task is the training of other nationalities in conventional warfare and internal defense, Delta Force is the army's "doer." Delta Force has been the ultimate strike weapon in operations spanning from Honduras to Grenada to Somalia. Delta Force was the first American unit in Baghdad before it was taken in 2003, and in coordination with other Tier-1 Special Operations Forces, the operators of Delta Force have captured more than 2,000 high-value targets in Afghanistan since 2001.

Current Role

U.S. Army Special Forces currently, and will continue to, play a critical role in the current War in Afghanistan and future conflicts. The task of special forces training foreign militaries and paramilitary groups in the strategies and tactics of unconventional warfare is of paramount importance when dealing with the continuing trend of hostile nonstate actors. In wartime, as well as in peacetime, these units will play a decisive role in the future of America's global presence.

SPECIAL OPERATIONS, STRATEGY

The U.S. Department of Defense defines special operations as operations conducted in hostile, denied, or politically sensitive environments to achieve military, diplomatic, informational, and/or economic objectives employing military capabilities for which there is no broad conventional force requirement. These operations often require covert, clandestine, or low-visibility capabilities. Special operations are applicable across the range of military operations. They can be conducted independently or in conjunction with the operations of conventional forces or other government agencies and may include operations through, with, or by indigenous or surrogate forces.

Special operations differ from conventional operations in degree of physical and political risk, operational techniques, mode of employment, independence from friendly support, and dependence on detailed operational intelligence and indigenous assets. Special operations are normally undertaken by smaller forces and are usually time sensitive in nature. This widely encompassing umbrella definition covers an important and vital mode of warfare emerging in the 21st century. This entry examines the history of U.S. Special Operations Forces, their capabilities, and their current role within the U.S. military.

History

Special operations have been conducted in one form or another for the entirety of U.S. history. The first British North American colonies required groups capable of reconnoitering the foreign country around them. Men like John Smith of Jamestown and others were the first to explore inland areas.

As the colonial experience evolved, these special groups remained, acting distinctly differently from the standard militias created for colonial defense. When the Native Americans and colonists fell into conflict, special groups were created to fight using tactics parallel to those of the Native American enemy. Benjamin Church created a group of colonists and friendly Native Americans highly capable in irregular warfare, reconnaissance, and other specialized needs. This unit was formed organically by Church and worked to support and complement the militia during King Philip's War. The activities of Church's men mark the beginning of legitimized special units in American history.

As the colonies became entangled in international conflicts like the Seven Years' War and the American War of Independence, special units became vitally important in supporting conventional forces. Men like Robert Rogers and Francis Marion existed outside the conventional structures of the colonial and American militaries. They galvanized public support, executed daring raiding missions, harassed enemy supply and logistical systems, and fulfilled a number of other supporting roles. During the American Civil War, there were a multitude of units and groups on both sides that met the special operations definition. Confederate colonel John Mosby and his partisan Rangers were an irregular force in northern Virginia. They were so effective that the Union Army had to commit a large conventional force to attempt to contain their harassing and destructive raids. These early groups were all formed on an ad hoc basis and were seldom fully appreciated by their conventional military counterparts. Within the conventional American military, there existed a consistently expressed prejudice against special and elite units, which kept any tradition of special operations purely provisional and ad hoc in nature.

The Second World War constitutes a landmark in the evolution and history of special operations and the U.S. military. This conflict witnessed a veritable explosion of special units across the spectrum of the U.S. armed forces, as every branch created and experimented with specialized units. President Franklin Roosevelt created the Office of Strategic Services, which served as the standard in design, tactics, and techniques for future special operations groups. The Office of Strategic Services was in its essence an intelligence organization and would lay

the groundwork for the eventual establishment of the Central Intelligence Agency. It was formed in 1942 partly as an effort to consolidate the pre-existing situation where each branch had its own intelligence-gathering service formed along ad hoc lines. The members of the Office of Strategic Services operated in every theater of the war, training foreign nationals, providing intelligence to theater commanders, and providing assistance to resistance groups within enemy-controlled countries. Also created were the various Army Ranger companies that fought in every theater in a multitude of roles. The U.S. Navy experimented with a variety of pre-landing units, the Beach Jumpers, beginning in 1943. These units experienced impressive successes executing diversionary landings on fake target beaches for the purpose of distracting Axis intelligence. Even the U.S. Marines, who expressed the belief that no elites could exist within the already elite Marine Corps, formed the very successful Marine Raider battalions. This cornucopia of specialized units was not permanent; the vast majority of these units were disbanded before the war's end, but the Second World War broke the precedent of the U.S. military's innate prejudice against special operations.

As the United States entered the Cold War and the era of nuclear confrontation, it also continued to struggle with the idea of special operations and the question of their continued usefulness and viability. As the newly formed Department of Defense dealt with burgeoning interservice rivalries, it also had to decide if elite units had a place in the new, nuclear-armed military of the future. The Korean War (1950–1953) immediately offered a new arena for experimentation. A wide variety of special operations units were formed, including psychological warfare experts, civilian affairs groups, and the Rangers, who returned to service. The United States also experimented with attempts at inciting a countercommunist insurgency within North Korea through direct involvement of the American special forces. Following Korea, the idea of special operations became a topic of serious debate that reached a climax in 1960 with the election of President John F. Kennedy. Kennedy was enamored with the idea of elite units. Kennedy and his administration had a high opinion of special operations units and believed that the special forces soldier was destined to become the face of the modern U.S. military. The

precise approach to warfare adopted by special operations forces was seemingly tailored to the kind of limited wars that Kennedy and his administration foresaw in the future. That admiration and strong belief, along with the now burgeoning ranks of experienced special forces veterans, pushed the United States to form a permanent institution centered on special operations, the Special Warfare Center and School at Fort Bragg, North Carolina.

The 1960s saw the widespread implementation of special operations units across the branches and their immediate deployment, first across Southeast Asia and then across the globe. The Vietnam War saw extensive special operations units utilized, from Army Special Forces and Navy SEALs (sea, air, land) to U.S. Air Force Air Commandos. These units conducted all manner of missions, from raids and long-range reconnaissance to inciting insurgencies within North Vietnam. Special Operations Forces captured the public eye during domestic tours and demonstrations, which helped create a popular impression of excellence among the American people. Following Vietnam, however, Special Operations Forces and their viability would be reexamined in the face of the “imminent” threat of conventional war with the Soviet Union.

During the 1970s, special operations and unconventional warfare experienced significant trials as the U.S. military as a whole suffered a dark decade of decay and mishap, characterized by President Jimmy Carter’s infamous 1979 “Malaise” speech. Following the failed rescue attempt of Iranian hostages in 1980 and the growing communist presence worldwide, however, the U.S. military reemphasized special operations. Thus, while the 1970s saw a decline in capability, the 1980s emerged as the beginning of a “golden age” for Special Operations Forces. This shift was marked by U.S. recommitment to unconventional warfare capabilities worldwide and the successes of special forces in places like Honduras, Grenada, and El Salvador, and the more than 50 other military engagements worldwide led by Special Operations Forces.

Tasks

Special operations’ primary purpose is to support conventional forces. This is done through inflicting both moral and material damage on an enemy. The foundation of the special operations unit is

the soldier himself or herself. The individual is the weapon in a Special Operations Force, with a strict emphasis placed on the human element over hardware. This allows these units to accomplish tasks that a larger, more conventional force would be incapable of approaching and completing.

Special operations are currently categorized into nine core tasks. The first and most visible are titled direct action (DA). These are defined as short-duration strikes and other small-scale offensive actions conducted in hostile, denied, or diplomatically sensitive environments that employ specialized military capabilities to seize, destroy, capture, exploit, recover, or damage designated targets. These activities constitute perhaps the most common implementation of Special Operations Forces.

Special reconnaissance missions are the second most often undertaken jobs. Special reconnaissance tasks are detail-oriented surveillance missions geared toward collecting or verifying information of strategic or operational significance, employing military capabilities not normally found in conventional forces. On many occasions, special operations units are the eyes and ears of the conventional forces they support. This represents one of the original and fundamental military needs that Special Operations Forces are designed for and able to meet.

During the Cold War, a multitude of insurgencies and internal uprisings arose across the globe. In situations deemed unfavorable to U.S. foreign policy, special forces units could be tasked with engaging in foreign internal defense (FID). FID is defined as participation by civilian and military agencies in any of the action programs undertaken by another government or organization to free and protect its society from subversion, lawlessness, insurgency, terrorism, and other threats to its security. FID, thus, encompasses U.S. special operations personnel providing training for foreign military and civilian organizations both in foreign nations and domestically at U.S. facilities.

Related to FID is the task of waging unconventional warfare (UW), which is defined as activity that enables a resistance movement or insurgency to coerce, disrupt, or overthrow a target government or occupying power by operating through or with an underground, auxiliary, or guerrilla force in a denied area. In its application, this encompasses a more direct, but still concealed, effort by Special Operations Forces operating in a foreign country.

Contemporarily, the most discussed and visible special operations task is counterterrorism (CT). CT is defined as action taken directly against terrorist networks to render global and regional environments inhospitable to terrorist activity. These missions are perhaps the most important for the U.S. military if current trends continue. The trend of nonstate actors playing a significant international role dictates the need for forces capable of countering this more elusive enemy. This task also requires special forces units to embed and to encourage and sponsor antiterrorist sentiment in sensitive regions around the world. Special operations units executing these tasks have been and will continue to be critically important in the Global War on Terrorism, now more fittingly titled the "Long War."

The Cold War fostered a global fear of nuclear warfare; therefore, one of the fundamental missions for which special operations units were trained during the 1960s was counterproliferation of weapons of mass destruction. Originally, this task was strictly aimed at preventing nuclear weapons from reaching hostile nations and groups. While this still remains a primary focus, over the past few decades, this task has grown to include chemical, biological, and purely radiological weapons of mass destruction. This task has become of paramount importance and difficulty with the emergence of more dangerous nonstate actors. This task goes hand in hand with CT, and presents perhaps the most immediate danger of the 21st century.

With Special Operations Forces committed to countering terrorism and the spread of weapons of mass destruction on a global scale, special operations units will continue to expand their influence on the populations of sensitive or hostile regions. The degree to which these civilian populations are affected by ongoing missions can be a deciding factor in the overall success of Special Operations Forces. Therefore, many special forces units are also tasked with conducting concurrent civil affairs missions. These activities help military commanders by working with civil authorities and civilian populations in the commander's area of operations to lessen the effects of military operations on civilian populations during peacetime, during contingency operations, and during the conduct of a declared war. This mission fosters a critically important relationship between conventional military commanders and civilian leaders for both parties to function more

cohesively. This mutually beneficial relationship assists the military in achieving its goals and assists the civilian population with material, medical, and a multitude of other forms of assistance.

A more strictly military-goal-oriented task sometimes coupled with civil affairs is psychological operations. Psychological operations encompasses operations designed to convey selected information and indicators to foreign audiences to influence emotions, motives, objective reasoning, and, ultimately, the behavior of foreign governments, organizations, groups, and individuals. The main purpose of this kind of operation is to induce or reinforce behavior favorable to U.S. objectives. These missions are conducted on three levels: (1) strategic, (2) operational, and (3) tactical. This wide spectrum allows for broad, overarching information campaigns to be broadcast globally, nationwide, and even regionally and locally. These operations can be very effective in lowering the morale of an enemy force, sustaining popular support within a civilian population, and affecting the decision-making process of enemy leadership.

Psychological operations fit under the wider umbrella of information operations. This constantly evolving mission is defined as the integrated employment, during military operations, of information-related capabilities in concert with other types of operations to influence, disrupt, corrupt, or usurp the decision-making capabilities of adversaries and potential adversaries while protecting U.S. objectives. This field has undergone a massive overhaul with the advent of global communication, the Internet, and other technologies, and it will be one of the most important tasks of Special Operations Forces looking forward into a rapidly globalizing world.

Together, these nine separate yet interconnected tasks constitute the wide range of missions under the special operations umbrella. These tasks are not executed independently of one another. This array of missions is complemented by an equally diverse array of units under the category of Special Operations Forces (SOF).

Special Operation Elements

The most visible special operations units are the Army Special Forces. These units were the first true SOF created during the late 1950s and are

distinguished by their iconic moniker and headgear, the “Green Berets.” Army Special Forces are designed primarily with UW in mind and therefore are primarily tasked with UW missions and FID. Army Special Forces are organized into Special Forces Groups, which are assigned to particular regions of the world. Each Special Forces Group is trained and educated with its particular region in mind.

The 75th Ranger Regiment is a unique SOF that bridges the gap between special operations and conventional infantry designs. The regiment serves as the standard bearer for infantry excellence within the U.S. Army. This elite unit specializes in DA and can serve as either special operations support for more conventional units or conventional support for smaller, more versatile Special Operating Forces.

Critically important to many contemporary SOFs is special operations aviation support. Units like the 160th Special Operations Aviation Regiment provide insertion, extraction, fire support, reconnaissance, and any other manner of assistance to SOFs via helicopter and other aviation platforms. While the special operations soldier is the main weapon of an SOF, many of their missions would be nearly impossible without hardware support like that provided by the 160th Special Operations Aviation Regiment.

Perhaps the most famous Special Operations Force in the world is the U.S. Navy SEALs. Officially designated as the navy’s sea, air, and land teams, this highly versatile type of unit is capable of a wide variety of special operations tasks, including DA, special reconnaissance, CT, FID, and UW, and is deployable anywhere in the world. The SEALs have worked in close concert with the Central Intelligence Agency on multiple occasions, famously with the Military Assistance Command in Vietnam–Special Observations Group during the Vietnam War and during contemporary wars in Iraq and Afghanistan. This cooperation reached a highly visible climax when Navy SEALs acted on Central Intelligence Agency intelligence in the finding and killing of Osama bin Laden during a DA mission in May 2011. The Navy SEALs represent one of the most adaptable and widely utilized SOF.

The U.S. Air Force Pararescue units represent one of the more unique SOFs, tasked with personnel recovery. The Pararescue Jumpers, or PJs, as they are commonly referred to, can be attached to any military branch to serve as an elite recovery unit. They are capable of retrieving personnel in both war

and peacetime emergencies, including heavy combat situations and natural disasters. This unit is capable of serving in any region of the world and has conducted rescue operations from Alaska to Iraq.

Current Role

In today’s world, SOFs are of critical importance to the future military and foreign policy endeavors of the United States. The U.S. Special Operations Command is a unified combatant command that was formed in 1987 following the failed Iranian hostage rescue known as Operation Eagle Claw. This command oversees the various special operations commands of the different branches and fosters interservice cooperation, actively directing operations conducted by units from multiple branches of the military. Currently, U.S. Special Operations Command and the various branch commands deploy SOFs in more than 75 countries on a yearly basis, and that number will surely rise as the United States develops a broader global presence.

SOFs have been enjoying a golden age under contemporary global conditions, in which CT and UW are the order of the day. Former secretary of defense Donald Rumsfeld tapped the SOFs as the lead elements of the Global War on Terrorism after 9/11. He authorized special operations members from every branch of the armed forces to conduct both covert and high-profile missions within Afghanistan and Iraq. By placing this emphasis on special operations from the beginning, Rumsfeld put even more momentum behind a growing trend within the U.S. military. The post-9/11 world dictates that a heavy emphasis be placed on special operations as America’s enemies become less traditional in their use of force and mode of organization and operation. Conventional forces are not equipped to properly combat nonstate actors, and therefore, more and more SOFs must be trained. This represents a dilemma in maintaining the elite quality of these units while simultaneously increasing the quantity of deployable assets. This very issue has led to certain identity problems within the armed forces, especially the army, where more and more units are being tasked to undertake special operations missions, even if it is outside their originally trained military occupational specialty. The question arises of how many military personnel are required and in what capacity. This is why current special operations directives stress FID missions, which allow the

relatively small number of SOF to multiply influence by cooperating with like-minded allies. The discussion about appropriate force will remain center stage as the U.S. military moves into the future; however, the SOF will undoubtedly remain the weapon of choice on the battlefields of the 21st century.

SPORTS

Sports have been an important aspect of U.S. military life since the early 20th century. From the Army-Navy football game to sports-associated pastimes in combat zones, the competition, physical training, and comradeship fostered by and through sports have remained a vital aspect of military life. Sports can also serve important diplomatic functions and continue to play a large role in today's military. This entry describes the history of sports in the U.S. military and examines the impact of sports, especially the Olympic Games, on U.S. diplomacy.

History

Sports play a distinctive role in American society politically, economically, socially, and culturally. Americans spend billions of dollars per year on tickets, team gear, and memorabilia for myriad

professional and collegiate sports teams. Millions of Americans maintain fierce loyalties to sports teams. Local and state governments regularly subsidize the construction of stadiums for professional teams across the country. Professional athletes in sports such as football, baseball, basketball, and hockey can command multimillion-dollar salaries and are major cultural icons. Metaphors that draw on sports terminology permeate the culture—for instance, the briefcase carrying the nuclear codes for the president of the United States to consult in the event of an attack is termed *the football*.

Sports, while a dominant part of American society, have not always played such a vital role. In fact, most sporting activities before the Civil War were largely ad hoc affairs. Until the late 19th century, the United States remained predominantly an agricultural society, leaving relatively little time for leisure, especially for farmers. Horse racing, especially among southern gentry, was the most popular spectator sport. Team sports as they emerged tended to be ad hoc, grass-roots efforts. Although attracting large audiences, until the 1920s, boxing remained illegal in most states and had a reputation for unbridled brutality.

Baseball's origins remain murky, but the game that has been termed *America's pastime* gained increasing popularity by the 1860s. During the Civil War, soldiers played baseball to relieve the boredom of camp or prison life. During Christmas 1862, an audience of 40,000 troops watched the 165th New York Volunteer Regiment play a group of selected Union regiments, reportedly the largest audience of the 19th century.

Baseball continued to be popular in the aftermath of the Civil War. Significantly, American troops fighting in the Spanish-American War played an important role in exporting the game to Cuba and other newly acquired American possessions. Cuban nationalists, eager to create a distinctive national identity, rejected bullfighting and embraced baseball. American occupation troops and Cuban civilians played baseball together. For African American troops, athletic competitions were one of the few outlets that allowed them to compete with White troops. For instance, during the Philippine insurrection, Black regiments fielded teams that regularly competed with their White counterparts in baseball and also fielded boxers.

The growing industrialization of American society sparked concern in leading figures like Theodore Roosevelt that American men were losing

their masculinity as an increasing number of men were making their living as office workers. Sports emerged as an important recreational outlet for male industrial workers as both participants and spectators. American college life witnessed a boom in organized intramural and extramural athletic competitions, especially centering around football. These contests were initially initiated by students but over the course of the 19th century were taken over by college administrations. Coaches were hired by the college authorities, and students played on fields and stadiums built expressly for this purpose.

The military academies emulated other colleges and universities. In the early 1880s, the United States Naval Academy began fielding football teams. The United States Military Academy quickly followed and, along with Annapolis, started competing with civilian universities. In 1890, the two academies competed in football and began one of the legendary rivalries in athletic history. The annual Army-Navy game attracts widespread interest not only among the student body and alumni of these two military academies but also in the entire army and navy.

A close friend of Teddy Roosevelt, General Leonard Wood, played a pivotal role in pushing the army to embrace competitive sports as a way to promote physical conditioning and build up the morale of soldiers. Under Wood's leadership, army commanders were encouraged not only to emphasize physical training but also to form athletic teams in a range of sports. Boxing became an especially favored sport, not only to encourage martial virtues among recruits but also as a spectator sport.

American entrance into World War I brought an influx of citizen soldiers into the army. Sports were viewed as one of the solutions to the growing problem of draftees partaking of alcohol and illicit sex. Voluntary organizations such as the YMCA and Knights of Columbus encouraged team sports such as basketball to provide wholesome outlets for young men in uniform. At the end of the war, the American Expeditionary Force not only staged an elaborate series of athletic matches in a range of sports but even organized a mini-Olympics that involved the troops of other nations.

During the interwar years, sports took on greater importance to an army perpetually short of funding for training and equipment. The officer corps, especially those with independent wealth, often indulged in equestrian sports. George S. Patton, who won fame as a hard-driving general in World

War II, spent much of the interwar years playing polo. Fielding winning teams remained a way for unit commanders to gain stature and success. This could have a dark side, however, as Jim Jones wrote in his novel *From Here to Eternity* (1951), describing an overzealous commander pressuring one of his men to become a prizefighter, to the detriment of his life and career.

World War II continued the pattern established in World War I. Moreover, the military made a concerted effort to publicize the service of prominent athletes drafted into the military. In many cases, athletes played on special teams, most notably football and baseball teams designed to entertain troops. The African American boxer Joe Louis fought exhibition rounds at army bases and supported bond drives. This era also represented a golden era for football for both Annapolis and West Point as these institutions attracted some of the best athletes in America, and civilian colleges lost most of their male student bodies to the draft.

During the Cold War, few professional athletes served in the military, in part because the number of draftees called up during the Korea and Vietnam Wars were fewer and there were more exemptions offered. Encouraging soldiers to participate in sports remained a hallmark of training and garrison life during this era. The rise of the all-volunteer military in 1973 led to the widespread use of print and broadcast media to encourage young men and women to enlist in the armed forces. Sporting events were a favorite place to advertise. The army established the World Class Athletic Program in 1978 to encourage and groom elite athletes to compete in the Olympics.

The continuation of the all-volunteer military during the Afghanistan and Iraq Wars made the decision by Pat Tillman to enlist in the service a source of considerable media and public attention. Turning down a multimillion-dollar contract, Tillman served with the Army Rangers and was deployed to Afghanistan. After he was killed in battle, the U.S. Army initially decorated him for bravery in the face of the enemy. Further investigation later demonstrated that Tillman had died from friendly fire.

As asymmetric conflicts, the wars in Afghanistan and Iraq presented fewer opportunities for soldiers to engage in athletic competitions since there was no clearly demarcated front line and rear. This lack of rear (safe) areas resulted in all troops in the combat zone needing to stand ready, leaving little or no ability to take part in sporting contests. But sports

continued to perform important functions, even though they were organized under difficult circumstances. For instance, in 2004, military personnel at the U.S. base outside Tarin Kowt in Afghanistan managed to stage a successful marathon despite the continuing threat posed by the enemy.

The Olympics Movement and Sports in American Diplomacy

The Olympic Games were revived in 1896 as an international amateur competition organized along national lines. The founder of the modern Olympic movement, Pierre de Coubertin, had two competing visions in promoting these games. On the one hand, Coubertin wanted to address what he saw as the growing lack of physical vigor among French youth and to ensure that they were fit for military service. On the other hand, Coubertin wanted the modern Olympics to promote harmony and peaceful relations between nations.

Shooting and fencing, sports popular among those associated with the military, were among the original sports of the first Olympics. Two additional sports would be developed by military officers and be dominated by those serving in the armed forces. In 1912, the first pentathlon was held, combining fencing, shooting, horseback riding, swimming, and track. George S. Patton competed in this inaugural event in Stockholm. Ski patrol, a sport that combined skiing and marksmanship, would be part of the Winter Games of 1924 and several additional interwar games. Renamed and formalized as the biathlon, it became a demonstration sport at the 1948 games and in 1960, became a permanent part of the Olympic movement. From 1958 to 1973, the U.S. biathlon team was sponsored by the U.S. Army, and it trained in Alaska at Fort Richardson.

Sporting events can also encompass political and diplomatic agendas. Most notably, countries have attempted to further their political agenda with the Olympic Games. The United States used sporting events such as the Olympic Games to promote democracy, while influencing peaceful resolutions on international issues. The Olympic Games also created some of the biggest sporting rivalries in history.

The 1936 Olympic Games represented the first time a country attempted to use the Olympic Games to illustrate its power to the rest of the world. Although Germany had won the right to host the games before the Nazi takeover, the Nazi regime sought to use

the games to further its racist and anti-Semitic ends. Although the president of the Amateur Athletic Union and other groups and individuals supported a U.S. boycott of the Olympics, Avery Brundage, president of the American Olympic Committee, convinced them to continue. That year, even though Germany won most of the medals, African American Jesse Owens challenged the Nazi regime's Aryan claim to dominance by winning four gold medals.

The start of the Cold War witnessed the origins of the biggest sporting rivalry in Olympic Games history. Joseph Stalin saw the 1952 Summer Olympic Games as a chance to showcase the strength of his communist government. Special trainers were sent out to look for talent in schools and on the streets. The Soviets showcased their training and demonstrated their strength by winning 69 medals, only 7 fewer than the American athletes.

Diplomacy also played an important role in the 1956 Olympic Games, which witnessed a number of controversies. The Soviet Union's involvement in the Hungarian Revolution, the Israeli military's invasion of the Suez Canal, and the International Olympic Committee's decision to allow Taiwan to compete independently of the People's Republic of China (PRC) caused significant discord. This caused several countries to boycott the 1956 games, including the PRC, Spain, Switzerland, the Netherlands, Cambodia, Egypt, Iraq, and Lebanon. These events again highlighted the connection between sports and diplomacy.

Boycotts became more common in later years. For instance, several African nations boycotted the 1976 Olympics in response to Western support for the apartheid government of South Africa. To protest the Soviet Union's invasion of Afghanistan in 1979, President Jimmy Carter called on U.S. athletes to boycott the 1980 Moscow Olympic. Four years later, the Soviets reciprocated by refusing to participate in the 1984 Olympics held in Los Angeles.

Sporting events can also build diplomatic relations between countries with bad relationships. The United States is notable for using sports to foster new diplomatic ties. Most notably, in 1971, President Richard M. Nixon sent U.S. table tennis players to the PRC. This was the first time Americans were setting foot in the PRC capital since 1949. Although China defeated the U.S. team, a new relationship between the PRC and the United States began.

The United States has begun using sports to target youth for future diplomatic ties with other countries. The creation of the Sports United program

in 2007 resulted in ties between U.S. and Iranian youth through the FINA (Fédération Internationale de Natation) Men's Junior World Water Polo Championship in Long Beach, California. Iran responded by giving U.S. athletes a standing ovation at the Takhti Cup wrestling championship.

Karen Hughes, who served as undersecretary of state for public diplomacy and public affairs from 2005 to 2007, became a leading advocate for using athletes and sports to promote U.S. public diplomacy. During her tenure, she worked to increase sporting programs and events grants to create diplomatic ties. On November 9, 2006, the Department of State Bureau of Public Diplomacy and Public Affairs opened positions for U.S. Public Diplomacy Envoy for athletes. This created a window of opportunity for athletes to increase the world's understanding of America's culture and its citizens. Athletes such as Michelle Kwan, Cal Ripken Jr., Juwan Howard, Dikembe Mutombo, and Nikki McCray have all served as sports ambassadors for U.S. sports, teaching discipline, leadership, determination, and respect for one another.

As the U.S. government increasingly looked to sports and athletes to promote diplomatic relationships, government funding followed. This has allowed the U.S. military to fund the use of sports in its branches. This funding of sports for diplomatic reasons, while keeping soldiers physically fit, has evolved into a worldwide success for the United States and its military.

SQUAD LEADERSHIP

The infantry squad is the basic working element of the U.S. military's ground forces. It is the most versatile and widely utilized element in the U.S. military arsenal. At the squad level, forces are capable of effectively executing the fundamental tactic of fire and maneuver. Squad members and their leadership are capable of carrying out a variety of missions that include patrols, ambushes, and other prepared attacks. The leadership of the squad possesses an ever-expanding skill set that can be applied to the abstract nature of the modern battlefield. In essence, the leadership of the squad is replicated in every level of the hierarchy of military leadership.

Throughout the past century, the role of the squad has been radically redefined. Modern advancements in technology and tactical innovations stress the role of small units more than in previous conflicts, making the squad indispensable on today's battlefield. The composition of a squad has been dictated by military doctrine and has thus changed with time. Today, a U.S. Army squad is composed of eight soldiers commanded by a squad leader. A Marine Corps squad has 12 marines commanded by a squad leader. The squad is further divided into four-man fire teams (two fire teams in an army squad and three in a Marine Corps squad), each commanded by a fire team leader. The squad leader and team leaders are traditionally noncommissioned officers. This entry describes the responsibilities of the squad

leader, the team leader, and the remaining squad members.

Leadership Positions

Squad Leader

The squad leader controls the entire squad, its movement, formation, security, and consequent action on contact with the enemy. Assignments for mission-specific duties (aid and litter, care of enemy prisoners of war, demolitions, etc.) are designated by the squad leader. The squad leader is expected to lead by example and retains responsibility for the welfare of the entire squad.

The squad leader must react to frequently changing circumstances on the battlefield. Negotiation of obstacles, danger areas, and enemy forces are among the situational responsibilities of the squad leader. The leadership of the squad leader is most critical when the squad makes contact with the enemy. At this point, the squad leader reacts to the situation by determining how the squad will respond to the threat. Once in contact, the squad leader must decide whether to continue to engage the enemy, either by suppression or by maneuver, or to break contact and disengage. Terrain, enemy position and composition, casualties, and mission objectives influence the squad leader's decisions. When the squad leader decides that the situation requires the division of the squad (as in a case of fire and maneuver), the squad leader will typically move with the maneuvering element. The situation will, however, dictate which element the squad leader stays with.

Team Leader

The fire team leaders are directly subordinate to the squad leader. They are responsible for the well-being and conduct of their fire teams. When directed, the team leaders will maneuver their teams in accordance with the orders of the squad leader. This is particularly important when the mission forces the squad leader to leave a fire team by itself. In the absence of the squad leader, the fire team leader assumes complete control of his fire team. When all fire teams are present but the squad leader is absent, the senior fire team leader assumes control of the entire squad. This might occur when the squad leader leaves the squad, or elements of the squad, to conduct reconnaissance or maneuver another portion of the squad, or if the squad leader becomes a casualty. In the event that the

squad leader and the senior fire team leader are not present, command of the squad falls with the next senior fire team leader.

Remaining Squad Members

In addition to their designated positions as riflemen, grenadiers, or automatic riflemen, and additionally assigned duties determined by the squad leader, the remaining squad members are responsible for assuming command and control of the squad in the absence of their leaders. Just as the fire team leaders will step into the position of squad leader in the squad leader's absence, the senior member of the fire team will assume command in the absence of his fire team leader. As the absence of the squad leader or a team leader makes control of the squad difficult, it is essential that every member of the squad understands how to carry out the responsibilities of the position above him so as to effectively adapt to the changing environment and carry out the mission.

STAFF RELATIONSHIPS

A commander's staff is a group of officers and non-commissioned officers that assist the commander with making and implementing decisions. This entry describes the functions, responsibilities, and organization of a commander's staff in the U.S. military.

The staff aids the commander by anticipating decision points in an operation and providing relevant information so that the commander can make and implement better decisions faster than the enemy can. The coordinating staff, commonly referred to as the primary staff, consists of personnel, intelligence, operations, logistics, plans, and communications officers. Special staff includes fire support, civil-military, and psychological operations officers, among others. Commanders also have a personal staff that usually consists of the senior enlisted member and

a chaplain, but the personal staff is designated at the commander's discretion. The number of special staff positions varies based on the command's level of organization and its specific organizational function. Staff sections, and the officers that lead them, are designated by letter and number codes. The Department of Defense uses "A" for the air force, "G" for the army and Marine Corps, "N" for the navy, and "J" for Joint Headquarters. Below the division or equivalent level, the designation "S" is used. The number code corresponds to the particular staff section. The personnel section is "1," intelligence "2," operations "3," and so forth. For example, the navy's senior intelligence officer is designated "N2." Staff members are experts in the subject matter of their designated fields and provide expert advice in the formulation and execution of operational plans.

Background of the General Staff

During the late 19th century, the U.S. Army and U.S. Navy instituted measures to professionalize their forces. Senior American military officers observed the role of the Prussian General Staff in that army's stunning success in the Franco-Prussian War of 1870–1871. As a result, General William T. Sherman established what would become the Command and General Staff School in 1881 at Fort Leavenworth, Kansas, modeled on the Prussian system, to provide a similar capability for the U.S. Army. At the turn of the 20th century, Congress created the General Staff Corps, charging the newly created institution with planning national defense measures and mobilization timetables. The navy created the Naval War College in Newport, Rhode Island, to instruct senior officers in grand strategy and staff functions. All of these measures affected the higher institutional levels of the U.S. military. Following World War I, General John J. Pershing formalized the staff functions down to the battalion level, a system still used today. The 1986 Goldwater-Nichols Act established the current senior staff relationships. The Joint Staff reports to the chairman of the Joint Chiefs of Staff, but this staff does not have operational control over combat units. Combatant commanders maintain control over those units but report through the Joint Staff. The size of a commander's staff at all levels has grown over the past decade as a result of the U.S. military's emphasis on building joint, modular forces and incorporating increasingly complex technologies into command networks.

Modern Staff Relationships

At the brigade or equivalent level and below, the primary staff consists of the personnel (S1), military intelligence (S2), operations (S3), logistics (S4), plans (S5), and communications (S6) officers. The staff is led by the second-in-command, designated as the executive officer (XO). In the army, air force, and Marine Corps, the S1, S2, S4, and S6 are usually a captain and the S3 a major. At the brigade level, majors usually serve as primary staff officers and are led by a lieutenant colonel XO. Lieutenant colonels usually hold staff positions and report to a colonel chief-of-staff (COS) at the division level.

The navy organizes its staff at two levels. Senior staff are designated by "N" and the corresponding number code. At the tactical level, a ship's commanding officer (CO) focuses on decision making and is supported by a second-in-command, the XO, who coordinates all the functions of the ship. The ship is organized into departments that include specialties like weapons deck, engineering, and operations, for example. The department heads report to the XO, who, in turn, reports to the CO. The functions of these officers are similar to those of ground force staff officers, but their organization is different due to differences in mission requirements and physical environments.

The personnel officer at any level of staff is responsible for all the administrative aspects of the unit. This includes personnel status reports, awards, retirements, and pay inquiries, among others. During wartime, the personnel officer manages casualty replacement operations in addition to his or her normal responsibilities. The intelligence officer is responsible for advising the commander on the current enemy situation and capabilities. The logistics officer is responsible for all logistical operations, including vehicle and weapon maintenance, supply ordering, field feeding service, and oversees personnel and medical operations. The supply and personnel officers work closely during wartime as some of their functions overlap. The communications officer is responsible for all command and control equipment, including computers, satellite receivers, radios, and Blue Force tracking systems, among others.

The senior member of the staff is the operations officer, who is responsible for the everyday operations of the organization, including training objectives. Training includes weapons qualification, tactical exercises, mobilization proficiency, and both noncommissioned officer and officer education. The operations officer produces and issues tactical orders

to subordinate units during deployment. Depending on the level of organization, the XO, deputy commander (DCO), or COS ensures unity of effort among the staff members.

Staff members follow the military decision-making process as a guide for analyzing problems and producing options for the commander to solve them. The military decision-making process consists of seven steps: (1) receipt of mission, (2) mission analysis, (3) course of action (COA) development, (4) COA analysis, (5) COA comparison, (6) COA approval, and (7) orders production. Each of these has numerous substeps, and each staff member has distinctive responsibilities in the process. The COS establishes and maintains a strict timeline for staff members based on the amount of time available between receipt of mission and mission execution. At each step of the process, the staff convenes for an in-progress report to share information and ensure that each staff officer is working toward the same objective. Ideally, the staff presents three COAs to the commander, but two are more common in practice due to time constraints. Once the commander has decided on a COA, the staff produces the mission order for subordinate units. Each service conducts its own version of this basic model.

STARS AND STRIPES (NEWSPAPER)

Stars and Stripes is a daily military newspaper that dates back to Union soldiers during the Civil War.

Continually published since World War II, the paper offers four daily print editions covering the Mideast, Europe, Japan, and Korea; it exists online at *Stripes.com*. *Stars and Stripes* provides information on matters affecting members of the U.S. military community, including military families, and has a daily readership of about 420,000. Authorized by the Department of Defense Directive 5122.11, *Stars and Stripes* is the only military news outlet guaranteed First Amendment rights as an organization that exists “without news management or censorship, *Stars and Stripes* is the only military news outlet guaranteed First Amendment rights, though its website notes that those rights are “subject to Congressional oversight.” Since the 1990s, the *Stars and Stripes*, at the direction of the U.S. Congress, has employed an ombudsman to ensure the editorial independence of the newspaper from Defense Department censorship or interference. This entry discusses the history and scope of *Stars and Stripes*.

The paper was founded on November 9, 1861, in Bloomfield, Missouri, by 10 Union soldiers from three Illinois regiments. Noticing the abandoned *Bloomfield Herald* offices, the 10 soldiers entered the building on the evening of November 8, and by the morning of November 9, a newspaper named *Stars and Stripes* was printed and distributed among the 2,000 troops in the area. The number of original copies is not known. A total of four issues were produced during the Civil War.

This early history set the precedent for the newspaper's reappearance in subsequent wars.

Pre-1945

On February 8, 1918, the World War I edition of the paper went to print, continuing publication on a weekly basis until June 13, 1919. Published by an all-military staff under the orders of General John J. “Black Jack” Pershing, the paper during this era aimed to promote unity and boost the morale of doughboys scattered across Europe. The readership reached some 526,000 military personnel.

By most accounts, the history of the modern-day *Stars and Stripes* began during World War II. Setting up in a London print shop, a few U.S. servicemen revived the paper on April 18, 1942, selling copies for the equivalent of 5 cents. The popularity of the paper prompted expanding the content from four pages to eight and printing daily instead of weekly. Over the course of the war, 32 editions of the paper would be printed, with 25 printing locations

established across Europe, the Middle East, North Africa, Asia, and the Pacific, and issues of the paper would run up to 24 pages. An official Pacific edition was launched on May 8, 1945.

The World War II *Stars and Stripes* catered to combat soldiers, its staff of enlisted men following the war as it unfolded on the battlefield and flying on bombing missions. Several staff members were killed covering combat. When the war ended, *Stars and Stripes* decided to continue publication as long as the United States had military personnel stationed abroad.

Post-1945

After World War II, the paper changed from staffing enlisted men to employing a higher number of civilian journalists to support the military photographers and management. Continuing publication through the wars in Korea and Vietnam, *Stars and Stripes* staffers would follow combat units to provide independent news coverage of all aspects of military life. The paper's staff would also embed during Operation Desert Shield, Operation Desert Storm, and Operation Provide Comfort, setting up a bureau in the Middle East, which helped double the paper's circulation. *Stars and Stripes* was also a presence during the American involvement in Bosnia in 1995.

Stars and Stripes reporters have been in Afghanistan since the war began in 2001, and in November 2004, the paper moved print operations from Europe to new facilities in Kabul. The ability to print locally ensures that servicemen will have reliable access to the daily paper. During the war in Iraq, *Stars and Stripes* staff not only embedded with ground forces but also joined naval ships patrolling the area. The paper continues to provide coverage from Iraq, even though Operation Iraqi Freedom ended in 2010 and the last troops left Iraq in mid-December 2011. The Mideastern edition of the paper delivers roughly 52,000 copies across Afghanistan, Kuwait, Bahrain, Egypt, and the rest of the region.

Modern Operations

With one of the widest print distributions of any newspaper, *Stars and Stripes* covers more than 40 countries with a U.S. military presence. In addition to the online, mobile, and four print editions, *Stars and Stripes* publishes weekly and monthly special issues and supplements. The Mideastern edition is available at no charge for the combat forces stationed there, while the other editions are for sale on

base and at military exchanges. Home delivery is available in a number of countries.

Typically, today's paper publishes more than military-related content, with the inclusion of sports, horoscopes, comics, and opinion pieces in addition to news. The original *Stars and Stripes* content is now complemented by stories from organizations like the Associated Press, Knight-Ridder, and *The Washington Post*. *Stars and Stripes* staffers are highly regarded within the journalism world, having won a number of prestigious awards in the past decade.

As of 2012, *Stars and Stripes* maintained three offices: one each in Europe and the Pacific and one in Washington, D.C. Each office has its own reporters and editors, as well as business and support staff. Web operations and newspaper layout are handled at the central office in the National Press Building in Washington. Each day's editions are transmitted to print sites in Germany, Italy, Spain, Japan, Kuwait, South Korea, Iraq, Afghanistan, Bahrain, Djibouti, Kyrgyzstan, Guam, and the United Kingdom.

Stars and Stripes launched its online edition at Stripes.com in 1999, giving the paper the ability to reach a broader audience more readily and offer additional services such as archives.

STEALTH TECHNOLOGY

Stealth, or low-observable (LO), aircraft are designed to bypass an enemy's radar system, thus gaining the ability to attack targets without alerting the enemy to the aircraft's presence. This entry discusses the history, technology, and missions of LO aircraft.

History

The idea of a radar-defeating aircraft is as old as radar itself. Although other services have looked into stealth technology for ships and vehicles, the technology refers almost exclusively to use in aircraft. During World War II, the Nazi regime attempted to build the Horton 229, a bomber containing many of the aspects of stealth technology found on today's LO aircraft. The advent of a true LO aircraft, however, did not occur until the post-Vietnam War era. American losses to surface-to-air missiles during Vietnam as well as the losses suffered by the Israeli air force in the 1973 Yom Kippur War showed the need to find an alternative to the brute force of flying through the coverage of Integrated Air Defense Systems. While certain tactics and weapons, including aircraft specifically tasked to engage and destroy enemy surface-to-air tracking and targeting systems and weapons—known as the “Wild Weasel”—proved effective against surface-to-air missile sites, some scientists looked for a way to bypass this threat altogether.

In the late 1970s, the Defense Advanced Research Projects Agency (DARPA) began to look at the possibility of building an aircraft with a low enough radar cross section to render it nearly invisible to modern radar systems. DARPA was on the hunt for the first true LO or stealth platform. It is important to remember that low observability does not equate to invisibility on radar. Simply stated, an LO aircraft combines aspects of aircraft design and, most important, the shaping and geometry of the aircraft with specialized coatings called radar-absorbent material. Used in conjunction on an aircraft, these technologies will lower its overall radar cross section, making it extremely difficult, but not impossible, to detect.

The F-117 Program

The U.S. Air Force in conjunction with DARPA took the lead in the development and advancement of LO technology. In 1975, DARPA sent requests to five aircraft-manufacturing companies (Northrop, McDonnell Douglas, General Dynamics, Fairchild,

and Grumman) to gauge interest and ability in producing an LO aircraft. It was said the LO studies went under the name of “Project Harvey,” in homage to the invisible rabbit from the movie starring Jimmy Stewart.

DARPA’s initial request required the aircraft companies to determine the feasibility of an aircraft design that would place its radar cross section below a predetermined threshold. Ironically, Lockheed Martin was not initially asked to participate and had to gain approval from the Central Intelligence Agency to brief DARPA on LO projects, including the A-12, which Lockheed had already produced. The A-12 was the predecessor to the SR-71 and incorporated many aspects of LO technology needed in the proposed aircraft. Already behind the other companies, Lockheed designers hustled to produce the necessary plans for their LO aircraft. The design and first aircraft went by the code name “Have Blue.” The Have Blue design was a multifaceted aircraft with radar-absorbent material coatings

on it that both absorbed radar and directed/transferred its energy away from the aircraft, thus giving the Have Blue an extremely small radar cross section. With the success of the Have Blue prototype, Lockheed was given the go-ahead to build five aircraft for test and evaluation, with a follow-on of a full-scale production run of 20 aircraft in the initial batch. Air Force Systems Command brought the project under the protection of the Special Access Program/Special Access Required world of air force classification and black programs. The Have Blue aircraft itself and all those involved in the continuing project now came under the code name Senior Trend.

The full-scale development of the Have Blue program led to the production of the world’s first true LO platform, the F-117. Aerodynamically, it was a poor aircraft; the initial concept had been called the “hopeless diamond” because many did not believe that it was capable of actual flight. Thanks to fly-by-wire technology—replacing physically connected

The U.S. Navy variant of the F-35 Joint Strike Fighter aircraft, the F-35C, conducts a test flight over the Chesapeake Bay near Naval Air Station Patuxent River in Maryland. The F-35C is distinct from the F-35A and F-35B variants, with larger wing surfaces and reinforced landing gear for greater control when operating in the demanding carrier take-off and landing environment.

control systems with electronic interfaces—the jet not only became capable of flight but also handled it very well, according to the pilots. The shaping of the F-117 along with its radar-absorbent coatings made it virtually invisible to the radar technology of the time. Many theories exist as to why the F-117 was given an “F” designation—meant to denote a fighter aircraft. Since the 117 only carried two bombs and no defensive armaments, it can hardly be considered a fighter aircraft, but it doesn’t fit into the categories of a bomber or attack aircraft either. The reality in the late 1970s is that the U.S. Air Force had already produced a new attack aircraft in the A-10, and the B-1 program had just been cancelled. Attaching an F designation to the 117 probably made it more palatable to Congress.

Stealth Aircraft in Combat

The F-117 saw its first operational use during Operation Just Cause in Panama but produced

negligible effects. Since Panama had no integrated air defense system, the applicability of the F-117’s stealth platform could not be debated. In 1991, the U.S. Air Force deployed F-117s to Saudi Arabia for Operation Desert Storm. The Nighthawks led the way into Iraq and were the only aircraft to operate directly over the skies of Baghdad.

Since that time, continuous advancements in LO technology have led to the production of other aircraft, including the B-2 Spirit and the F-22 Raptor. The B-2 entered into combat in the late 1990s and has since then flown combat missions over Yugoslavia and Afghanistan from its home station at Whiteman Air Force Base, Missouri. The F-22 has distinctive requirements that set it apart from legacy LO platforms. These include an expanded fleet several times larger than the F-117 or B-2 and a high-performance (9G, thrust vectoring, 60K ft, super cruise) flight envelope necessary for a modern fighter. As of 2011, the F-22 had yet to see combat, although it has been deployed overseas on multiple

occasions. The coming years will also see the production of the F-35 Lightning, the first LO platform to be operated by the U.S. Air Force as well as the U.S. Navy and Marine Corps.

The first challenge to the 30-year dominance of the United States in LO technology came in 2010. Both Russia and China produced flyable prototypes of new fighter aircraft, demonstrating their advances in stealth technology. The Russian aircraft, known alternately as the PAK-FA (Prospective Airborne Complex—Frontline Aviation/*Perspektivny aviatsionny kompleks frontovoy aviatsii*) or T-50, appeared in 2009 and made its maiden flight in January 2010. On December 22, 2010, China's Chengdu J-20 made its first public appearance while accomplishing a series of high-speed taxiing tests outside the Chengdu Aircraft Design Institute. In early 2011, the J-20 made its first confirmed flight. Both aircraft show the use of aircraft shaping and internal weapons bays to decrease the radar cross section, but it remains to be seen just how LO each will be in the long run. Of the two, the J-20 is considerably larger than its Russian counterpart as well as the F-22. Many media outlets in the United States made mention that the J-20 design is based on technology acquired from a downed F-117 from the Balkan wars of the 1990s. This is highly unlikely as the F-117 technology was already dated; its use as a “new” LO platform simply does not make sense, and a modern high-G fighter would not survive on the decades-old technology used on the F-117. That being said, both countries have made huge strides toward fifth-generation capabilities; whether they will equal the F-22 in performance, flight envelope, and internal avionics components remains to be seen.

STOP-LOSS

Stop-loss is a Department of Defense (DOD) procedure that kept service members on involuntary active duty beyond their otherwise scheduled date of separation. It ended on March 1, 2011.

Stop-loss was first used during the Persian Gulf War of 1990–1991 and was invoked during the various peacekeeping and combat operations in the Balkans throughout the 1990s. However, it has only been applied to large numbers of military personnel over a long period of time since September 11, 2001. All four Department of Defense military services used stop-loss in the initial stages of post-9/11 military operations, but the U.S. Navy, Marine Corps, and Air Force all ended their stop-loss programs by June 2003. The U.S. Army, on the other hand, has used stop-loss on a massive basis since 9/11, not only for the active army but also for the Army Reserve and Army National Guard. Although, by the direction of the Secretary of Defense, the army ended the application of stop-loss on January 1, 2010, this suspension was not retroactive. Soldiers affected by it thus remained on active duty until March 1, 2011, when the last units that deployed under stop-loss returned to the United States and completed 90 days of postdeployment duty. (The legal authority for stop-loss has no expiration date and remains in effect.) Legislation enacted in 2008 and 2009 provided special pay for military personnel affected by stop-loss, eventually making these payments retroactive to 9/11 and extended them to June 30, 2011, although, as noted, the program ended on March 1, 2011.

Stop-loss was initially used by all four military services to keep individuals with critical skills on active duty, particularly in the immediate post-9/11 period and during the “major combat operations” phase of the Iraq War, during the spring and early summer of 2003. However, after June 2003, only the army used it to keep people in units scheduled for deployment to Iraq or Afghanistan. In general, stop-loss “froze” soldiers from leaving units up to 90 days before deployment, lasted through the deployment period

(usually 12 months, although the army maintained a 15-month deployment period in 2007–2008, and 2012 reduced Afghanistan deployment lengths to 9 months), and continued for up to 90 days after the unit returned home. Soldiers could therefore be kept on active duty for up to 18 months past their originally scheduled separation date.

The army apparently did not keep a running total of soldiers affected by stop-loss. In 2009, to determine the potential costs of stop-loss special pay, it estimated that approximately 185,000 had been stop-lossed since 9/11, but knowledgeable individuals believe that this may have understated the total due to recordkeeping problems. Other estimates, however, are lower, centering around 140,000–145,000 soldiers. This figure is comparable to a total, as of July 31, 2012 (the most recent figures available), of approximately 1,233,000 army personnel (active, Army National Guard, and Army Reserve) deployed to OIF and OEF since 9/11. Given the uncertainties and disparate dates, it would thus appear that about 15% of the soldiers deployed have been affected by stop-loss.

The need for stop-loss thus derived entirely from the army's policy of rotating entire units into and out of Iraq and Afghanistan rather than deploying units, keeping them there, and rotating individuals after their unit deployment periods were over. In the absence of the unit rotation policy, there would have been no need for unit-based stop-loss. The army used individual rotation and replacement for the nation's modern prolonged wars, from World War I (1917–1918) through the Vietnam War (1965–1973). The need for a policy approximating stop-loss had thus never arisen before. However, in some previous wars, individuals whose voluntary enlistments would otherwise expire were involuntarily kept on active duty for the duration of the conflict, and retirements from a military career were suspended.

Stop-loss did engender some controversy. In particular, the involuntary extension of active-duty commitments has been called a "back door draft" by some. In legal terms, this is not the case. The statutory authority for stop-loss derives from a 1984 statute (codified at 10 USC 12305) that authorizes the president to suspend all laws pertaining to "promotion, retirement, and separation" of military personnel if a national emergency has been declared or if a reserve mobilization has taken place. The courts have upheld the legality of this statute and the use

of stop-loss. More broadly, the term *draft* would appear to be inapplicable. Military personnel who were stop-lossed all enlisted voluntarily. Enlistment contracts have always included references to contingencies that could be construed as including stop-loss. However, in 2006, in response to congressional findings that the contract language related to stop-loss was too vague, the Department of Defense included revised wording in enlistment contracts that more explicitly stated what stop-loss was and how enlistees could be subject to it.

Some have conflated stop-loss with the involuntary mobilization of members of the Individual Ready Reserve, although the two are completely different. All individuals who enter the armed forces incur a statutory military service obligation of 8 years, any part of which not spent on active duty must be spent in a reserve status. Unless service members leaving active duty voluntarily enter a reserve unit that trains regularly and are paid for their training, they are assigned to the Individual Ready Reserve until their total 8-year military service obligation is complete. Individual Ready Reserve activation thus involves an individual not on active duty being called to active duty, whereas stop-loss involved an individual already on active duty having his or her active-duty service extended.

Stop-loss does not appear to have generated any morale or discipline problems appreciably affecting military operations or combat capability. There are no analytical or impressionistic indications that stop-loss affected recruiting or retention to any appreciable extent. Stop-loss did disproportionately affect noncommissioned officers and, by doing so, ensured that army units deployed with their full complements of these key enlisted leaders. Special pays to encourage soldiers who would otherwise have left active duty to stay with their unit when it deployed did not have many takers in the active army and Army Reserve, although they were accepted by more than half of eligible Army National Guard members. It would appear, therefore, that stop-loss, however unpleasant for some of the individuals involved, was of material assistance in readying army units for war, and the army never arrived at an adequate replacement for it. As the total proportion of army manpower deployed in a combat zone has declined, especially after all U.S. troops left Iraq as of December 31, 2011, the need to use it declined as well. For instance, between November 2004 (the first month for which statistics

are available) and November 2009, the number of soldiers stop-lossed at any one time fluctuated from a high of 16,000 in March 2005 and a low of about 8,500 in May 2007. However, in December 2009, it began a steady decline until the end of the program on March 1, 2011. Stop-loss, therefore, was a temporary expedient related to maintaining readiness of units deploying to a war zone. Whether it will ever be instituted again depends on the size of the force deployed relative to the size of the total force and whether sufficient personnel in key skill areas are available.

STRATEGIC AIR COMMAND

The Strategic Air Command (SAC) was the organization tasked with the responsibility of managing the U.S. arsenal of nuclear weapons from 1946 to 1992. From its headquarters located at Offutt Air Force Base outside Omaha, Nebraska, SAC managed the fleet of nuclear bombers, ballistic missiles, and related nuclear warheads. Additionally, SAC provided aerial reconnaissance, electronic intelligence, airborne refueling, and, for a time, fighter escorts. In short, SAC provided a mobile, flexible, and powerful force dedicated to preventing nuclear war, while retaining the power to conduct it as well. At the end of the Cold War, SAC was decommissioned, and the

mission of nuclear deterrence was incorporated into the newly formed U.S. Strategic Command. This entry describes the history, missions, aircraft and equipment, and missile systems of SAC.

SAC emerged out of the post–World War II landscape. SAC was designed to have an offensive presence so powerful that it deterred other nations from attacking the United States. Originally part of the Army Air Forces, SAC became part of the U.S. Air Force with the National Security Act in 1947. After World War II, the War Department sought to bolster air defense over the continental United States, which resulted in the creation of three commands: (1) Tactical Air Command (air force tactics), (2) Air Defense Command (defense of U.S. airspace), and (3) Strategic Air Command. SAC's specific mission was to manage the U.S. nuclear arsenal and prevent nuclear war. It also had responsibility for global reconnaissance, aerial refueling, and conventional weapons bombing. SAC also developed the Joint Strategic Target Planning and Single Integrated Operational Plans, which in case of war determined when nuclear weapons were to be used and at what targets. For the first years, and for most of its existence, SAC went through a significant amount of organizational reconfigurations, continually adding and subtracting units as the mission and technology changed. General George C. Kenney was the first commander in chief of SAC. However, the figure most associated with SAC is General Curtis LeMay. LeMay, the often outspoken champion of SAC, took over in 1948 and turned the organization into a professional fighting force. During LeMay's tenure as commander in chief of SAC, SAC made many advances in strategic bomber development and tactics, aerial refueling, intercontinental ballistic missiles (ICBMs), and command and control systems.

Historical Significance

SAC played a crucial role in many of the crises and events of the Cold War. Three squadrons of SAC B-29 bombers were put on alert in Europe during the Berlin Blockade of 1948–1949, providing a deterrent against potential Russian invasion. Shortly after the North Koreans invaded South Korea in 1950, SAC bombers responded by eliminating nearly every strategic target north of the 38th parallel. Throughout the rest of the Korean War, SAC provided both tactical offensive operations and support for ground forces. SAC's reconnaissance capability played a

Soviet truck convoy deploying missiles near San Cristobal, Cuba, on October 14, 1962. This photo, taken by Major Steve Heyser in a USAF U-2, is the first picture that proved Russian missiles were being employed in Cuba. The image is dated the day it was printed.

Source: U.S. Air Force photo.

critical role in the Cuban Missile Crisis. It was an SAC U-2 plane that brought back photographic evidence of Russian missiles in Cuba. Throughout the crisis, SAC operated in full-alert status with round-the-clock missions. During the Vietnam War, SAC provided aerial refueling, reconnaissance, and airborne command and control services. Additionally, SAC bombers conducted conventional bombing missions throughout the duration of the war.

Aircraft

A variety of aircraft supported the SAC mission over the years. The first fleet of SAC bombers

consisted of B-29s left over from World War II. The propeller-driven B-29 was the same aircraft that delivered the atomic bombs on Hiroshima and Nagasaki, Japan. Eventually, the B-47 Stratojet, a swept-wing jet-propelled bomber, entered SAC service in 1951. Starting in 1955, the B-52 Stratofortress became the centerpiece of the SAC bomber force. The B-52 traveled at 630 miles per hour, flew as high as 55,000 feet, and had a range of more than 4,000 miles. For non-bombing-related tasks, the Boeing KC-135, built on Boeing's 707 passenger fuselage, became the SAC workhorse. The KC-135 became the primary aircraft used for aerial refueling. The KC-135 airframe was also converted into

A B-52D Stratofortress aircraft waits beside the runway as a B-52G approaches for landing after completing a bombing mission over North Vietnam during Operation Linebacker. The aircraft are from the Strategic Air Command.

Source: Department of Defense photo.

the EC-135 and the RC-135. The EC-135 was fitted with communications equipment that allowed it to become an airborne command post. The RC-135 was fitted with a variety of electronic surveillance and communications equipment to support electronic surveillance and information gathering. For aerial reconnaissance, the SAC's U-2 aircraft could fly slowly at high altitudes over long ranges to gather intelligence. The SR-71 Blackbird replaced the U-2 as the primary reconnaissance aircraft. The SR-71 traveled at nearly 2,000 miles per hour and could fly as high as 80,000 feet. The equipment on these aircraft included a variety of high-tech photographic, video, and electronic intelligence-gathering

equipment, as well as sensors to detect airborne nuclear debris from nuclear bomb detonations. This allowed SAC to gather and analyze this information on enemy defenses, capabilities, and targeting of nuclear weapons.

Ballistic Missiles

In addition to maintaining and operating the nuclear bomber force, SAC had responsibility for the U.S. arsenal of nuclear ballistic missiles. Starting in February 1958, SAC brought online the Atlas ICBM. In subsequent years, SAC deployed and managed the Titan, Minuteman, and Peacekeeper

ICBMs. SAC also managed the Thor and Jupiter intermediate-range ballistic missiles. Support for all the missile silos, associated military bases, support staff, and communications required to operate the ICBMs and intermediate-range ballistic missiles also fell to SAC.

Post–Cold War

The downsizing of the U.S. military assets throughout the 1990s, resulting from the end of the Cold War, brought the end of SAC. The U.S. Strategic Command emerged after SAC's decommission in 1992, to take on the duties of managing the nuclear deterrent and strategic striking capability. The U.S. Strategic Command's mission expanded to include space operations, electronic warfare, computer information operations, missile defense, and intelligence. Meanwhile, SAC's aerial refueling, reconnaissance, bomber, and ICBM duties were transferred to other air force commands.

Conclusion

SAC's motto was "Peace is our profession," and for nearly 46 years SAC did its part to ensure peace in a world of proliferating nuclear weapons. The men and women of SAC stood watch against the threat of nuclear war. While the duty of preventing nuclear war has been transferred to a different organization, the means to achieve it remain modeled on the organization of and lessons learned by SAC.

STRATEGIC ARMS LIMITATION TREATIES

Strategic arms limitation treaties represent a series of international agreements designed to limit the spread and use of nuclear, chemical, and biological weapons. The unique properties of these weapons make their testing and deployment an international issue, as they encompass a nearly unlimited capability for destruction. The continuing development of strategic nuclear weapons has led to a successive number of treaties trying to limit the use of this weaponry in the name of international stability and environmental protection. The treaties limiting strategic armaments began with the Limited Test Ban Treaty (LTBT) of 1963 and continue into present-day negotiations.

Strategic weapons are designed to attack civilian production and population centers in addition to military targets, as an effort to eliminate a rival nation's ability to make war or deter it from launching a similar attack. Strategic weapons are large-scale versions of tactical nuclear weapons; the latter are designed to destroy primarily military targets in smaller, more contained, explosions. What differentiates these weapons from conventional armaments is the scale of their potential destruction combined with lingering environmental after-effects. The atomic bombings of Hiroshima and Nagasaki by the United States in August 1945 embodied the first use of strategic armaments, as these individual bombs demolished entire cities and the radioactive fallout poisoned life in the area for years afterward. Since that time, the size of the bombs and the scale of the destruction have increased exponentially. Coupled with the development of intercontinental bombers and ballistic missile delivery systems, these weapons are capable of striking any location in the world. The total power of the world's nuclear arsenals, specifically those of the United States and the USSR during the Cold War, were sufficient to encompass the whole world. Widespread use of strategic nuclear weaponry would result in heavy loss of life and devastation of the world.

There are two different types of nuclear weapons and three means of delivery. Nuclear weapons are deployed either in gravity bombs or in warheads. Nuclear gravity bombs are deployed by aircraft.

The size of strategic nuclear bombs prevents their deployment from smaller planes. Nuclear warheads are applied to missiles launched either from land-based missile silos or from submarines. The former provide hardened facilities that might survive enemy attack, while the latter provide an invisible deterrent; silos are easy to detect and survey, but submarines are stealthy and can be deployed significantly closer to the enemy's critical areas.

When the Soviet Union developed its own strategic capabilities, it became apparent that only two limitations prevented the outbreak of nuclear warfare. The technological sophistication required to build these strategic weapons meant that few countries could cultivate this expensive capability. The resources and technical skill to develop the launcher technology provided further deterrence. Second, the political will to create, test, and deploy these armaments was, and is, dependent on international toleration of their existence. International treaties attempted to limit the spread and use of these strategic arms, as they represented a long-term menace to environments and populations.

Controlling Nuclear Tests and the Spread of Nuclear Technology

The LTBT of 1963 was the first international treaty created to regulate the testing of strategic armaments. The treaty prohibits the testing of nuclear weapons that could result in the spread of radioactive material into extraterritorial environments, such as the atmosphere, the seas, and outer space. As a model for future strategic arms treaties, the trilateral treaty was signed by the United States, the Soviet Union, and Great Britain, with additional signatories joining through the United Nations. This voluntary treaty contains no mechanism for supervision or enforcement, so sovereign governments had no formal obligations to adhere to its clauses.

In 1967, the Outer Space Treaty specifically banned the positioning of strategic weapons in a particular environment. The treaty bans the placement of nuclear weapons in installations orbiting the earth or other planets as these areas are reserved for peaceful scientific exploration. Unlike the LTBT, the Outer Space Treaty contained provisions for verifying compliance through international observers, and states were legally responsible to the international community if violations occurred.

The Latin American Nuclear Free Zone Treaty (Treaty of Tlatelolco), also concluded in 1967, is unique in representing a regional rejection of nuclear armaments. The countries of South America agreed to avoid acquiring strategic weapons as this would keep their region free from the liability of a nuclear conflict. Involvement in the treaty was mandatory for all nations within the geographic limits of South America, and an independent organization was set up to ensure acquiescence.

The Nuclear Non-Proliferation Treaty of 1968 was the first treaty to address the growing number of nations with strategic capabilities and the need to limit the spread of this technology. The treaty prohibited the sharing of nuclear armaments between nations and restricted the spread of fissionable material. The International Atomic Energy Agency would enforce the technology ban, and all established nations with nuclear weaponry were required to attend a review conference by the UN Security Council every 5 years.

In 1971, the Seabed Arms Control Treaty (Seabed Treaty) was a direct outgrowth of growing international concern over the deployment of strategic weapons on the seabed. Similar to the Outer Space Treaty, the treaty prohibits strategic weapons deployment on the sea floor in deference to oceanographic research. An international committee would review enforcement of the treaty in the same manner as for the Nuclear Non-Proliferation Treaty.

The 1972 Biological Weapons Convention was the first disarmament treaty to proactively confront a new strategic capability. The development of biological and chemical weapons had reached a point where they became comparable to nuclear armaments, but the unpredictable nature of these arms made them dangerously unstable. No system of international supervision was instituted; however, the treaty stipulated that any violations would be investigated under the UN Security Council.

The Threshold Test Ban Treaty limited underground testing of nuclear weapons in terms of destructive yield. The LTBT had banned most forms of nuclear weapons testing, but by 1974, the United States and the Soviet Union agreed to limit the underground testing of strategic weapons to fewer than 150 kilotons (the atomic bomb detonated over Nagasaki was 21 kilotons). The bilateral treaty did not completely forbid these two nations from testing strategic armaments underground, yet it required

both countries to pass a strict scientific verification process for all testing.

Limiting the Numbers: The Strategic Arms Limitation Treaties

The first comprehensive attempt at wide-scale strategic disarmament was the Strategic Arms Limitation Treaty (SALT) of 1972, which represented the combination of two separate treaties. In an attempt to halt the continuing nuclear arms race between the United States and the Soviet Union, the two powers agreed to limit the development of defensive anti-ballistic missile systems, so that mutually assured destruction would provide the main deterrence against the use of nuclear weapons. Two anti-ballistic missile sites were allowed to each signatory, one to defend the capital city and another to defend a land-based silo of their choice. The second treaty dealt directly with the number of launchers each side was able to construct. Current numbers of launchers were frozen, and new silos and submarine missile launchers were not allowed to be constructed, though previously built launchers could be modernized. This second half of the SALT Treaty was known as the Interim Agreement on the Limitation of Strategic Offensive Arms. These bilateral agreements were enforced by a commission from both countries and only applied to the United States and the Soviet Union, the two nuclear superpowers.

The SALT treaty was rendered ineffective by the development of multiple independently targetable reentry vehicles (MIRVs). MIRVs allowed for multiple warheads to be placed on a single missile, greatly increasing the power and lethality of each individual missile and creating a new form of nuclear arms race. Early models had 3 warheads, but development led to the creation of MIRVs armed with up to 12 warheads. Thus, while launcher and missile numbers remained the same, the nuclear arsenals of the Soviet Union and the United States were steadily increasing, and lethality was growing. MIRVs also provided a quick-strike capability; a few missiles could do a great deal of damage before the other side was able to counterattack.

The second SALT treaty, signed in 1979, was designed to deal with the numbers of MIRVs as well as the number of launchers. A key failure of the first SALT treaty was the fact that bombers were not termed *launchers*, favoring the U.S. nuclear bomber

force. The SALT II Treaty took this into account, providing a maximum number of 2,400 launcher systems, encompassing land-based silos, submarines, and bombers. The maximum number of MIRV-equipped missiles was capped at 1,320. Having created a ceiling, it was hoped that the arms race would now slow down.

The Soviet Union's invasion of Afghanistan in 1979 served to strain relations between the superpowers, leading to questions about whether the United States would comply with the treaty in the face of Soviet belligerence. American actions, such as Ronald Reagan's Strategic Defense Initiative, primarily grew out of fear that the Soviet Union was working to upset the nuclear balance of power. The SALT II Treaty also led to a different form of arms race. Given the limited number of missiles and MIRVs, this race focused on increasing the size and survivability of the missiles.

Targeting the Numbers: The Strategic Arms Reduction Treaties (START), Strategic Offensive Reduction Treaty, and New START Treaty

Among the failures of SALT and SALT II was the fact that neither of the treaties dealt with reduction of the numbers of launchers or warheads. Begun in earnest in 1985, negotiations for the Strategic Arms Reduction Treaty (START) concluded in 1987, and the treaty was signed in 1991 by President George H. W. Bush and General Secretary Mikhail Gorbachev. Under the terms of START, both sides agreed on a limit of 1,600 launchers, encompassing silos, submarines, and bombers, with a ceiling of 6,000 warheads attributed to the launchers. A time limit of 7 years was established to oversee the disarmament process. Measures were also put in place to limit throw-weight, the weight of all non-fuel-based components of a missile, incorporating the MIRV, warheads, guidance system, and countermeasures.

START was followed rapidly by START II, lowering the number of deployed warheads to 3,000–3,500 per side. However, America's refusal to renew the Anti-Ballistic Missile Treaty, which had expired in 2002, caused Russia to cancel this treaty. The Strategic Offensive Reduction Treaty (SORT), also known as the Moscow Treaty, was rapidly negotiated in the aftermath. Signed in 2002, the treaty sought to lower the number of missiles

to 1,700–2,200 by December 31, 2012. The United States worked to meet its limits by removing warheads from missiles, decommissioning missiles and the removal of missiles, launchers, and bombers from operational service.

The New START Treaty (NST) was signed in 2010 to renew the START treaty, set to expire in 2009. Continuing on the progress of the Moscow Treaty, the NST fixed another 7-year goal to reduce numbers to 800 deployed and nondeployed launchers and heavy bombers. No more than 700 can be deployed. Attached to this is a limit of 1,550 deployed warheads. Under this treaty, deployed launchers are those equipped with missiles or bombs. Test and training facilities are not counted in the total. The treaty allows for the transformation of deployed materiel to be reused for nonnuclear purposes, such as the modification of nuclear bombers into conventional bombers. In addition to disarmament, the treaty also allows for inspection of nuclear missile and bomber sites, as well as examination of those sites declared as nondeployed. In addition, biannual meetings of the Bilateral Consultative Commission take place to resolve any questions regarding compliance of the treaty.

STRATEGY, AIR POWER

Air power tactics include the skills and art of flying aircraft for military purposes, including aerial combat, reconnaissance, air-to-ground attack, movement of personnel and cargo, and all of the other purposes to which aircraft and aerial weapons such as missiles or combat drones may be put to use to achieve immediate military goals. Air power strategy involves more sweeping questions. To what uses can aircraft and aerial weapons be effectively and appropriately put? Do the capabilities of modern aircraft and weapons technologies open up new possibilities for strategic thought and planning, possibilities previously unavailable to land- or sea-based forces without access to the third dimension? How does air power strategy fit into military planning in a modern world where ethical, political, and economic factors often limit large-scale use of ground and sea forces but, perhaps, still allow for the utilization of air power? Conversely, are there factors of the modern military world, perhaps especially the rise of nonstate actors and the emphasis of many groups on asymmetrical warfare, that limit the effectiveness of air power? How do air power strategists balance these and other conflicting forces, which seem at times to simultaneously enhance the importance and centrality of air power to the modern military enterprise while also limiting the effective uses of air power? An answer to these more contemporary questions must arise from an understanding of the historical roots and development of air power strategy.

The Early Years

The development of air power doctrine and strategy, like the development of all military theory, had multiple foundations, including not just the exigencies of combat but political and social factors; diplomatic developments; perceived issues of morality, ethics, and law; and technological advancements. The last has loomed particularly important with regard to air power doctrine. Perhaps no aspect of military thought before the advent of the

information technology era was so closely intertwined with scientific and engineering trends and discoveries. At least as far back as the work of Leonardo da Vinci, the prospect of manned flight has been married to the needs of warfare. One of the first actions taken by Wilbur and Orville Wright after their 1903 flight was to approach the U.S. Army and Navy about the possibility of military contracts.

The earliest theoretical uses of aircraft were for reconnaissance and observation. Balloons had proven useful for this in the 19th century and would continue to serve such a purpose in the 20th. It was not surprising, then, that with the advent of World War I, the first uses of aircraft were concentrated on the mapping of territory, the identification of enemy lines, and tracking the movement of armored bodies and supplies. There is, however, no greater spur to technical development and human ingenuity than war, since there is no other activity in which demands are so critical and so rapidly changing. Along with improved wing and engine design and improved environmental protections for pilots and passengers, counterefforts to prevent aerial reconnaissance also saw a vast evolution. The most important of these was the invention of a synchronizing mechanism that allowed the pilot to fire bullets through his plane's propeller arc, thus transforming the aircraft into an aerial fighting machine. Armies began to send up these pursuit craft to chase observers from the skies, while their opponents sent up their own planes to protect the reconnaissance aircraft. Thus dawned the day of the dogfight.

Although these developments excited the public imagination and brought forth new celebrities such as Manfred von Richthofen, the famed Red Baron, the thinking of military experts went well beyond the jousting of airborne knights. The potential for airplanes to deliver explosives was readily apparent. The development of bomber aircraft proceeded rapidly. The contribution of airborne bombs to the war was minimal when compared with artillery, mines, and grenades, but it seemed to foreshadow momentous changes in the nature of war. The bombing of cities such as London by airplanes and zeppelins raised panic among the civilian population, and suddenly the specter of war spreading beyond the forward zones into the very hearts of struggling nations began to preoccupy military and political leaders.

This concern found its first powerful voice in the works of Giulio Douhet, an Italian former artillery officer, whose book *The Command of the Air*,

completed in 1921, set the terms of the conversation in air power theory for many decades, arguably even into the present. Douhet observed that the evolution of air power created a third dimension in war, a dimension that allowed forces to move quickly through vast spaces toward their targets. This would seem to have been a fairly obvious observation, but Douhet combined it with lessons drawn from the experiences of the First World War to create a complete vision of future warfare.

Douhet saw in air power a way of breaking the stalemate that had come to characterize land warfare. He envisaged an age in which fleets of bombers would sail effortlessly over the grinding surface battle to strike hard at the enemy's cities and logistical structures. Douhet believed that an air war would be, by its very nature, offensive and oriented to the attack, as opposed to the defensive characteristics that had dominated most of the European land campaigns of the First World War. A "counter-air" battle, in which airplane fought airplane, would be impossible as it would be incredibly difficult to trace and intercept the movements of an oncoming air force. The use of pursuit aircraft such as the one that had appeared during the Great War to defend fixed targets was made impractical by the impossibility of keeping enough of these craft in the air and ready to repel a bombing force that might suddenly appear over a target. Thus, the advantage would go to the side that struck first and struck quickly. If all sides were to maintain large air forces capable of striking and retaliation, then peace would be maintained by fear of the enemy's use of its air power in response.

To us in the 21st century, this seems a strange, indeed mystifying, misunderstanding of the nature of the air power instrument. But Douhet was writing before the appearance of radar or even man-portable radios. An effective system of early warning, whether by radar or by teams of observers linked by radio, was not yet possible. It is, perhaps, more puzzling that an artillery officer such as Douhet could not envisage the development of effective anti-aircraft guns, which could be kept manned and ready at all times for defense of fixed targets.

Nothing about Douhet's thought impeded the evolution of either pursuit aircraft or anti-aircraft guns, which was more guided by technical and scientific breakthroughs and the exigencies of national budgeting. However, his emphases did have a major impact. Douhet had seen air power as an instrument of war that was fundamentally different from

land or sea power and that should, therefore, have its own institutional organization as well as its own doctrines and strategic ideas. This was enthusiastically taken up by European and American air power advocates in the wake of the war. Douhet's ideas about the importance of strategic bombing, that is, the use of air power to attack the enemy's cities and infrastructure as well as armed forces, likewise found a receptive audience.

The experiences of bombing during World War I, although relatively limited compared with what was to come later, had left national leaders with little faith in the ability of civilian workers and the general civilian population to endure in the face of an airborne attack. This pessimistic attitude was, perhaps, enhanced by the great success of British forces in using air power to police restive civilian populations in its imperial holdings. Douhet's belief in the impracticality of an air power defense also affected some in the popular and political culture, if not in military and arms production circles. Fear of aerial attack of large population centers had existed even before the First World War, as illustrated in such stark visions as H. G. Wells's *The War in the Air*, first published in 1908, which told of a fictional air war of apocalyptic consequence. When combined with the experience of the war and after, this led to some holding dire forebodings of the effect of a future war on the large cities of the world, subjected to aerial bombardment. This was perhaps best summed up in the British prime minister Stanley Baldwin's gloomy utterance in 1932 that "the bomber will always get through."

Strategic Bombing and World War II

In terms of thinking about air power strategy, the British Royal Air Force, which had obtained status as an independent arm of military service on April 1, 1918—while World War I was still under way—contributed much through the ideas of Marshal Hugh Trenchard, 1st Viscount Trenchard (known as the father of the Royal Air Force), and his protégé Marshal Sir John "Jack" Slessor, author of an influential volume titled *Air Power and Armies*. Trenchard was an enthusiastic advocate of strategic bombing as the primary means of prosecuting a war. He became particularly known for the oft-misunderstood doctrine of morale bombing. Trenchard's enemies tended to accuse him of advocating the deliberate targeting of the civilian population for the

purpose of causing terror and revolt; however, his ideas were more sophisticated than that. Trenchard believed that a policy of targeting industrial facilities and infrastructure would inevitably have a profound effect on the morale of the civilian population, a belief many felt was borne out by the experience in the Great War. He held that this effect had to be acknowledged and factored into calculations of the possible benefits of a strategic bombing campaign, even if the infliction of misery on civilians was not the primary purpose of the campaign.

Slessor agreed with his mentor on the importance of strategic bombing, but he tended to emphasize that this was but one aspect of an air campaign that had to be waged in close coordination with land forces (and, to be fair, Trenchard had also never seen an air campaign as being completely divorced from land war). Slessor was keenly aware of developments in areas such as communications, armor, and infantry tactics, developments pressed by figures such as J. F. C. Fuller in England, Erwin Rommel and Heinz Guderian in Germany, and Charles de Gaulle in France. These new weapons and techniques held the promise of breaking the defensive stalemate that land war had exhibited during the First World War. Slessor believed that the air weapon must be flexible and integrated strategically and tactically with the land effort.

In America, the development of air power was dominated by a steady campaign for an air force independent from the army. This campaign was led by figures such as Mason Patrick, Benjamin Foulois, Henry "Hap" Arnold, and William "Billy" Mitchell, and it culminated in the air corps being granted a large degree of autonomy, although not complete independence, as the U.S. Army Air Forces in 1941. The development of thought at the Air Corps Tactical School was heavily influenced by this search for independence, as the advocates of air power made strenuous arguments for a separate and specialized mission requiring separate and specialized organizations and institutions. Strategic bombing was a heavy component of this new mission, although the American advocates tended to de-emphasize morale effects and speak of economic and logistical disruption to the enemy brought about by high-accuracy bombing of industrial and military targets.

In terms of sea power, arguments over the use of air assets were raging as well. Organizationally, this battle tended to emphasize the unity of the sea mission, with the new air and submarine surfaces

remaining integrated with the more classic surface navy (although the British did briefly experiment with other forms of organization). In terms of strategy and tactics, the arguments tended to come down between those favoring air power as the wave of the future and those who saw the powerful surface fleet, including the battleships, as still being the key players in naval warfare.

Answers of a kind to those controversies were given by the events of World War II. The importance of air power to sea warfare was decisively illustrated. In terms of land warfare, the joint missions of coordination with ground troops and strategic bombing proved crucial. The history of joint warfare, that is, of coordination between air and ground units, had begun in World War I. But it was in the Second World War that this relationship flowered. Although the level of cooperation between the Luftwaffe and the German army in the early stages of the war has often been exaggerated, the blitzkrieg did provide an important step of continuity in the development of air-ground tactics. By the end of the conflict, especially in arenas such as the invasion of and battle for Normandy, the critical nature of close air support missions, with air power assets directly aiding ground troops (and giving nearby aid in the form of strikes against the enemy's immediate rear and supply lines), had become clear. However, strategic bombing was in the end not a campaign of pinpoint strikes but mass obliteration, often with mixed or disappointing results. Air power strategists often engaged in the basic strategic mistake of mirroring, that is of assuming that the enemy resembled oneself, rather than gathering independent evidence about the actual state of affairs on the ground. Allied air planners often displayed ignorance of the fact that, for instance, German industrial processes and supply chains were organized and physically laid out in ways different from similar industrial conglomerations in Britain or the United States. For instance, Allied planners initially showed ignorance of the fact that German oil refineries and chemical processing plants were often centralized and colocated, unlike the more dispersed and individualized plant facilities in Britain or the United States, and thus missed the fact that oil refineries were even more valuable targets than they would have been otherwise. Similarly, the planners initially missed the fact that ball bearing production was a crucial choke point in the manufacture of German war materiel. Once these mistakes of understanding and intelligence were rectified and

appropriate targets chosen, the results of the strategic bombing campaign improved dramatically. Battles such as Kasserine Pass showed what could go wrong in the absence of sophisticated and integrated ways of commanding and controlling air power assets. The use of the atomic bomb at the end of the war introduced an era in which destruction on a global scale was possible. The threat of nuclear war, particularly after Soviet development of the weapon, raised strategic, diplomatic, political, and moral issues that proved extremely difficult to resolve.

The Nuclear Era

Institutionally, the primary development for air power in the United States was the creation of a separate U.S. Air Force by the National Security Act of 1947. The new air force, like the rest of the nation, soon found itself gripped by the bloody conflagration on the Korean Peninsula and the more long-term issues of a grinding, bitter Cold War with an adversary that was feared and respected, albeit in some ways little understood. The overwhelming issue facing the air force, an issue embodied in the Strategic Air Command, an organization that came for many to embody the ideals of the Cold War military, was that of nuclear war. Issues of nuclear delivery and strategy spurred technological and doctrinal development; with the gradual result that nuclear strategy came to dominate almost every aspect of air force thinking and activity. Even the "tactical" units within the air force found themselves planning and training for the exercise of air power in the context of a nuclear conflict.

A new and for many a terrifying twist came in 1957 with the *Sputnik* crisis. This illustrated the importance of space and missile technology for the future of the United States in general and the U.S. military and its strategic plans in particular. It also seemed an object lesson in the deficiencies in scientific and technical achievement in the United States and the other Western powers. The air force, like the rest of the U.S. military, became deeply involved in the development of missile and space technology. Missiles armed with nuclear warheads became an integral part of the air force arsenal, as well as those of the army and navy (in the latter case, mounted in submarines).

The Vietnam conflict revealed the traps into which Cold War thinking had led the United States. An air force dedicated primarily to the nuclear mission proved ill equipped to deal with the

exigencies of an irregular war fraught with political and military restrictions on the full use of military force. Coordination between the air power of the air force, marines, and navy proved poor. Perhaps the most famous example of this was the practice of dividing Vietnam, both North and South, into route packages—regions where air operations were the sole responsibility of a given service. Thus, the efforts of the different services were automatically disparate in space, and often also in time, as there was little consultation or coordination as to the timing of attacks. More important, there was no unified strategic intent; attacks against industrial targets, communication and supply routes, and fielded enemy forces were conducted with little overall plan or overarching military goal. The lack of coordination became even more pronounced as the military leadership in Vietnam moved into an attrition model of warfare designed to wear down the enemy. This decision has been one of the most controversial in the history of American warfare. In terms of air power strategy and tactics, it led rapidly to a war of statistics, in which each service was in a race with the others in terms of numbers of sorties, numbers of bombs delivered, and other parameters that often had little relationship to either immediate or overall military effectiveness.

The widespread use of the helicopter, first extensively used in the Korean War, added a new dynamic to the mix of air power planning and operations. Until this development, personnel and cargo had been transported through three main methods: by land, sea, and fixed-wing aircraft. Sea and fixed-wing transport required a massive infrastructure and relatively fixed routes. Land transport, although more flexible, was also the least efficient in terms of large-scale mobility and certainly the most vulnerable to disruption by enemy action. The arrival of the helicopter married land, sea, and air transport into a flexible, relatively durable web. Air mobility and air assault became as crucial to the planning of army and marine units as land mobility and assault had been in previous eras. Finally, all branches of the service faced stringent adjustments with the end of compulsory military service.

The military rallied to these challenges with vigor. Several developments proved crucial in the recovery from the Vietnam experience. New tactical developments had begun even before the end of the Vietnam War. The navy's Top Gun School and, later, the air force's Red Flag exercise specialized in

realistic training against forces designed to emulate real-world enemy equipment and tactics.

The Modern Era

Along with this came a new doctrine of air power command and control. This doctrine, which was embodied in a massive military reorganization mandated by the Goldwater-Nichols Act of 1986, held that all air power in a given area of responsibility was to come under the operational control of a single commander, the Joint Force Air Component Commander, who—would be responsible under the overall operational commander, for the planning and conduct of air operations, thus grouping the air power assets of the different services under a single entity. This allowed the flourishing of a new kind of thinking in the area of air power, or perhaps it is better to say that it is a new emphasis on older ideals. This approach emphasized systems, with air power as part of one system of intelligence gathering, planning, logistics, and operations aimed at the disruption of enemy systems.

This kind of thinking was exemplified in the work of John Warden. A colonel in the U.S. Air Force, Warden developed a model of planning an air campaign that sketched the enemy in terms of concentric circles, from command and control through infrastructure and energy to the general population and finally fielded forces. Warden held that strategic air power should concentrate on disruption of the inner rings, or command and control and energy, while supporting the land forces in their attack on the outermost ring, the enemy's forces. Another exemplar of this kind of systems approach was the work of another U.S. Air Force colonel, John Boyd. Boyd emphasized the loop of decision making that rests at the heart of complex systems, a decision loop he labeled OODA (for the steps of observation, orientation, decision, and action).

These models came together during Operation Desert Shield/Desert Storm, along with three key technological and organizational developments: (1) the rise of ever more sophisticated precision-guided munitions, which allowed much greater accuracy and exactness in targeting enemy forces and installations; (2) the development of stealth technology, which effectively thwarted many of the enemy's radar and warning systems; and (3) the Air and Space Operations Center, an organization that sought to bring together all elements of air power

planning, command, and control in a single entity connected to field events through modern information technology. The final ingredient in the air power campaign in Desert Storm was the concept of effects-based operations, which emphasized that the success or failure of an attack should be measured not in absolute standards of destruction but rather in the effect the attack had on disabling the enemy's ability to conduct military operations.

The success of the air campaign during Operation Desert Storm was followed by continuing operations in the Middle East as well as in Bosnia, Kosovo, and Serbia. However, with the commencement of Operation Enduring Freedom and Operation Iraqi Freedom, American air power faced a new set of priorities. Now air power had to operate in the context of a messy and immensely complicated counterinsurgency regime, an arena in which friend and foe were often indistinguishable until the last moment and where intelligence was often more important than pure offensive capability. It was this aspect of air power, combined with the continuing importance of precision guided munition and stealth technology, that promised to shape the future of air power strategy.

Future Challenges

Basic trends and structural facts that seem sure to have an impact on the development of air power strategy in the 21st century are already in place, although doubtless other factors not even imagined will arise to have great impact on a field of strategic thought barely a century old. Nevertheless, the position of the United States as the sole remaining world superpower sets the basic strategic parameters of development, as does the rapid modernization of other military forces, such as those of China and India. This is only the basic field of play, where several strategic factors—technological, operational, and economic—will interact to determine the future evolution of air power strategy. The most obvious technological development is the ability to access, transfer, and process large amounts of digital information rapidly and accurately. This capability underpins the advances in precision targeting that enable much of modern air power's most impressive weaponry. It also allows for electronic fly-by-wire and remote control architecture, which has enabled the construction of superior aircraft and the explosive growth of unmanned aerial vehicles or drones as features of the three-dimensional battlefield.

But the capability to process such information comes with challenges. The technological networks that enable this digital processing are themselves vulnerable. In a physical sense, the networks constitute valuable infrastructure that must be secured and guarded with the same rigor as aircraft, installations, or weaponry. However, the technology itself creates a new kind of space, cyberspace, in which threats develop, operations play out, and, in short, warfare commences. Operations within cyberspace, whether offensive or defensive, crucially affect more classic air power operations and increasingly are seen as inseparable from them. Operations within cyberspace call for special knowledge and expertise, which air forces will increasingly have to develop, along with the physical infrastructure and organizational support to plan, prepare for, and execute such operations.

The physical infrastructure required by modern data processing extends beyond the boundaries of the earth, including beyond the boundaries of the atmosphere. Much of the data-gathering and transfer capability on which modern air forces rely is located in satellites in various orbits about the globe. Air forces, and militaries in general, have long relied on satellites for intelligence and basic data processing, and the capabilities of the Global Positioning System are crucial to the modern economy as well as to academic and scientific endeavors, governments, and militaries. The importance of outer space to air power strategy will continue to increase in the coming century, once again calling for expertise and organizational flexibility. The role of air forces in outer space activities seems natural, as outer space borders the atmospheric regions in which air forces operate. Although outer space is not simply an extension of the atmosphere, and although all military forces, not just air forces, have a profound interest in and dependence on this region, the crucial importance of space activities for air power strategy will probably mushroom as the century progresses.

All of these technological changes, however, must deal with the continued importance, and likely greatly increased prevalence, of asymmetrical warfare in the future. Open clashes between and among major air power forces are unlikely in the foreseeable future, but situations in which air power must be deployed against insurgent forces hidden in difficult terrain and among local populations will likely proliferate. The capabilities of data-gathering and precision munitions, and of drone aircraft, will be called on to deal with these difficult operational realities

even as enemy insurgent forces constantly adjust to make the application of modern technology more difficult. Current operations in Afghanistan and Iraq are illustrative of this. The ongoing conversation between strategy and operational needs is as old as warfare itself, but the speed with which that conversation plays out, the rapidity of action and reaction, and thus the pace of overall change have accelerated dramatically over the past few decades and will likely continue to do so through at least the midterm future.

But these developments must also take place in a milieu of rapidly escalating costs. The price of military technology has continued to climb well beyond general rates of inflation, even as air forces, particularly in the developed world, face mounting challenges from personnel costs reflective of education expense and health care costs, among other factors. Even as the demands for new technology grow greater, and as the demands for older technology continue and also increase, the economic challenges of meeting these demands will grow, meaning that air power strategy must inevitably become economic and budgeting strategy as well, as nations and militaries must make agonizing choices among pressing needs.

STRATEGY, GROUND WAR

Ground war strategy is the collective action that articulates how the ground campaign will achieve the goal of fighting and winning a war. Ground war strategy is implemented when there is a commitment of land forces. This should not be confused with operations or tactics. Operations are a sub-component that is conducted to achieve the strategic goal. Tactics are those actions taken to maneuver or countermaneuver an opposing force. Ground war strategy has evolved over the past 2,000 years due to changes in technology and revelations in operations and tactics. It can be observed in history where technology outpaced the tactics, for example, the American Civil War. There are instances where the tactics were moving forward and forcing technology to keep pace; an example of this is World War I and the use of combined arms tactics forcing technology to keep up. Both of these instances had a tremendous impact on the ground war strategy. Yet there are principles that will be perpetually present. Sun Tzu articulated standards and theories for the conduct of war in the 6th century BCE that are still read and studied today by military strategists.

Background and Development of Ground War Strategy

The structure of the U.S. military has forced changes regarding how strategy is implemented. Each major conflict in the 20th century before the end of the Cold War saw a surge in manpower for the U.S. military. The idea that overwhelming force was a key to decisive victory was the prevalent thought prior to the end of the Cold War. Another key component of the U.S. strategy is the enemy; and during the Cold

War, this was easily definable. This component, the enemy, steered training and capability requirements. The United States prepared, trained, and equipped the military to fight the Soviets. While these are important aspects, the development of strategy is not exclusive to technology, tactics, and the enemy but is geared to achieving the goal of fighting and winning a war.

The Army War College defines the development of strategy as “ends, ways, and means.” This construct is used in developing strategies to identify gaps and overcompensation. The “ends” identify the goal or objective. During the 1990s and into the post-9/11 era, this became a more difficult task. The “ways” tell how the military achieves these goals. The “ways” are articulated in plans that are built around scenarios for different regions in the world. The “means” provide the capability to achieve the “ways” and “ends.” As this simple construct is observed, breaches and overlap can be recognized, and the strategy can be developed.

One of the most important developments in the U.S. military that had a profound impact on ground war strategy was the Goldwater-Nichols Department of Defense Reorganization Act of 1986. During the Vietnam era, all the services had independent command structures, leaving room for miscommunication and a lack of coordination. During World War II, the command structure was even more splintered, with the appointment of a secretary of the navy and a secretary of war. With the advent of the air force after World War II, interservice rivalry became worse. All the branches of the service were competing for funds and justifying their capabilities independent of each other. The Goldwater-Nichols act established a command structure that allowed a unified combatant commander to report to the secretary of defense and then to the president. The service chiefs of each branch filled an advisory capacity and became responsible for the training and equipping of their

respective branches. This had an enormous impact on the ground war strategy, which became a joint effort rather than an independent endeavor by land forces. When deploying a force over strategic distances, the operation becomes a joint enterprise and requires the necessary planning. The ground war strategy would now become a unified venture under one combat commander, and the first to lead this undertaking was General H. Norman Schwarzkopf, commander of the U.S. Central Command during the Persian Gulf War.

Post–Cold War to Desert Storm

The end of the Cold War was a pivotal point for the U.S. military. Until then, the armed forces had a well-defined enemy with a set of tactics that were studied and well-known throughout the military. The military's capabilities were built to defeat the Soviets, and overseas bases were positioned to provide a quick response to the Soviet threat. The ground war strategy fell into line. Plans were set, and the military was prepared, strategically, to fight and win a war with the Soviets. Commanders had grown up in a military where the enemy's strategy was as predictable as the sun rising.

The first formidable enemy the United States faced post–Cold War (taking into account the Panama Intervention in December 1989) was Saddam Hussein and the Iraqi army. The construct of the Iraqi army was much like what the U.S. military had prepared to face. Iraq had capabilities similar to the Soviets, although most of its equipment was outdated, was not maintained, or lacked trained personnel to operate it. On August 2, 1990, the Iraqi army invaded Kuwait, which drew condemnation and sanctions imposed by the UN Security Council. On January 17, 1991, the air campaign of the Persian Gulf War began, and more than 100,000 sorties were flown. Once the ground campaign began, a cease-fire was declared 100 hours later, giving it the nickname “100-Hour War”; and on February 27, 1991, President George H. W. Bush ordered the cessation of military operations.

The ground campaign represented the outworking of the ground war strategy. In the Persian Gulf War (1991), the ground campaign composition was primarily heavy-armor divisions and mechanized infantry. This was the capability set that the military had prepared to use against the Soviets during the Cold War. The ground war strategy was built

around employing these heavy forces. Tanks and mechanized infantry (armored personnel carriers) utilize a markedly different strategy from light forces. Additionally, the logistical “tail” that is needed to maintain the heavy forces is significantly larger than for the light forces. Light forces are those units that consist of primarily infantry soldiers, who can be transported to the battlefield through parachute drop or rotary wing (helicopter) assets.

Building a ground war strategy around employing heavy forces requires tremendous logistical support, transportation assets to move the equipment to the battlefield, and trained operators for the equipment. This strategy, for defeating a conventional heavy army, was coming to an end. It was what the U.S. military prepared for, but the Persian Gulf War would be one of the last conventional efforts they faced for the next 20 years.

The 1990s and Strategy Outside Major Combat Operations

After the end of the Persian Gulf War, American ground war strategy was in a state of flux. The size of the army (the U.S. land force) had been drastically reduced. The future was less certain than it had been in the past 50 years. The army continued to train to fight a Cold War era enemy. At the National Training Center, Fort Irwin, California, U.S. tanks faced off with Soviet-style tanks and tactics. The commanders were fighting the last war—the war they had been preparing for nearly 50 years. Meanwhile, some members of the army began to talk about the need for a more flexible force. The talk was of a ground force that can maneuver like a heavy unit with some of the firepower, yet be lighter and more flexible. There was a growing need to send fewer soldiers to respond to a threat quickly, while maintaining some of the attributes of a heavy unit. This brought about the advent of the Interim Brigade Combat Team. The Interim Brigade Combat Team required a new vehicle, and it went to the drawing board. The outcome was the Stryker, a wheeled vehicle that could be easily deployed and had some of the firepower and survivability of a tank.

The Interim Brigade Combat Team became the Stryker Brigade Combat Team (SBCT), which became a segue unit in the ground war strategy. The SBCT was not to be used as an early-entry or forcible-entry unit. The SBCT was to be used as a force to bridge the gap between the time interval of

heavy and light units. The SBCT was intended to put a brigade combat team anywhere in the world within 96 hours of liftoff and a division on the ground in 120 hours. This would fill the gap between survivability and time. Light units could be deployed quickly but lacked survivability compared with the heavy units, which could not be deployed quickly but retained survivability. While this was a feasible solution to responding to a Soviet-style enemy, it was not effective for an unconventional, irregular force the United States would face in the near future.

The 1990s produced more independent military operations than in any other decade in U.S. history. The beginning was the Persian Gulf War (1991). Shortly after that was a U.S.-led multinational effort to assist the war-torn country of Somalia (1992). This effort produced a tremendous amount of media coverage and forever changed the idea of ground war strategy in the minds of military commanders. The United States was not involved to win a war or repatriate people; it was to provide protection so that food and other resources could be delivered to famine-stricken people. This would be a recurring theme throughout the 1990s—providing humanitarian assistance and disaster relief. This is where the departure from current ground war strategy occurred. Military commanders had to provide assistance to a local population, meanwhile protecting themselves and the population but limiting their use of force. The enemy was not well-defined and had no identifying uniform or marking. The strategy the enemy used was unpredictable, and the weapons were a mix of Soviet-style to new, high-tech implements. From Haiti to Bosnia, the face of the enemy changed and changed quickly. The ground war strategy needed to catch up and meet the growing need to defeat a nonuniformed adversary who could employ a multitude of weapon systems and is not subject to international law and agreements.

Redefining victory or the “ends” in developing the ground war strategy became a key component to defeating the adversary, as well as providing the “means” and determining the “ways.” This gave way to the introduction of counterinsurgency (COIN) operations. General David Petraeus was the lead proponent of this strategy, the COIN campaign. The roles and responsibilities of soldiers and commanders became a spectrum as opposed to narrowly defined duties. On the ground, tactical decisions had strategic effects, and success was not decisive but rather measured in degrees.

Post-9/11 and COIN

September 11, 2001, had a tremendous effect on the United States of America. The ripples were felt throughout society, but a wave was made in the U.S. military as it became clear that the U.S. ground war strategy needed to change. The National Training Center at Fort Irwin transitioned from training units in tactics, to defeating Soviet-style armies with tanks, to engaging with civilians in villages and identifying roadside bombs or improvised explosive devices. The military had invested in technology and became increasingly reliant on high-tech devices, only to be defeated by relatively primitive mechanisms. The ground war strategy was being shaped by a reaction to an ill-equipped, untrained force with little to no central leadership. That decisive victory and unconditional surrender were not an option became all too apparent.

During Operation Iraqi Freedom (Iraq) and Operation Enduring Freedom (Afghanistan) commanders had varying degrees of success. Some commanders approached the ground war strategy with a conventional, regular-warfare mind-set. Other commanders saw the necessity of unconventional warfare and of utilizing a hybrid of offensive, defensive, and stability operations. This approach became known as COIN operations. The field manual for the joint endeavor between the army and marine corps became known as COIN FM 3-24/MCWP 3-33.5 and was published in December 2006. The following is an extract from the first paragraph of the manual:

This manual is designed to fill a doctrinal gap. It has been 20 years since the Army published a field manual devoted exclusively to counterinsurgency operations. For the Marine Corps it has been 25 years. With our Soldiers and Marines fighting insurgents in Afghanistan and Iraq, it is essential that we give them a manual that provides principles and guidelines for counterinsurgency operations. Such guidance must be grounded in historical studies. However, it also must be informed by contemporary experiences.

This changed the position and outlook for the ground war strategy. The strategy was now being constructed around completely different “ends.” The ends were to stabilize the host nation by providing security force assistance and building partner capacity. The last two terms, security force assistance and building partner capacity, became hallmark expressions in the U.S. military. Because the ends

An Iraqi interpreter known as Mr. Washington, right, serving with the U.S. Army 155th Brigade Combat Team, Mississippi Army National Guard, helps U.S. Army Sergeant 1st Class Dennis Adams, left, with 5th Platoon, 1st Squadron, 98th Cavalry Regiment, question an Iraqi man after literature on chemical explosives and supporting insurgency were found in his home in Hasawa, Iraq, on June 19, 2005. had drastically changed, the “ways” and “means” needed to be completely overhauled. The ways were being defined by identifying groups of people by religion, race, and ethnicity and how supportive they are to the host nation or insurgents. This was done to predict reactions to U.S. intervention and operations in different regions and to determine the level of support to the host nation. COIN FM 3-24 indicates that the assessment of counterinsurgents’ perceptions can begin to answer the following questions:

Are counterinsurgents exhibiting Western or American values that the populace does not appreciate?

Are embedded American beliefs preventing the unit from understanding the host nation population or its multinational partners?

Is what the intelligence and command staff perceives really what is happening?

Does the populace believe what the unit believes?

Is there something that is part of the populace’s (or a subgroup’s) perception that can be detrimental to the unit?

Ultimately, the ground war strategy has shifted from fighting and winning war to stabilizing nations. The way the U.S. military is employed can be better described as a spectrum rather than a specific function. In past conflicts, the U.S. military was utilized as a force to defeat an armed enemy through offensive and defensive operations. In what are called full-spectrum operations, the U.S. military conducts offensive, defensive, and stability operations independently or simultaneously. Stability operations are

nontraditional but recently are being conducted the most often. Since the end of the Cold War, the United States has faced fewer peer and near-peer competitors, but it has seen more nonstate adversaries, failing states, and states that sponsor terrorist activities. These adversaries pose a different threat and require a different ground war strategy, a strategy that continues to require the application of force but with markedly different goals—specifically, a move away from unconditional surrender and/or territorial control toward goals like ending insurgencies and stabilizing regimes. This is not entirely different from the approach Carl von Clausewitz took to viewing war. Clausewitz's idea that there is "pure war" and "war to achieve limited aims" is a dialectic approach, and the reality is somewhere in between. The ground war strategy still requires the application of force, however, to achieve different goals that are not as easily defined as unconditional surrender.

The post-9/11 ground war strategy is a joint operation that incorporates a variety of actors. The "battlefield" is not symmetric with regard to physical space and front lines. The battlefield looks more like spheres of influence than a front line pushing forward to an objective. Additionally, it is not symmetric with regard to the enemy. The enemy could be operating through local nationals or could appear as a host nation force with ill intentions. Other factors that are taken into account when surveying the ground war strategy are private contractors, tribal and religious affiliations, and the global landscape. The need to support a protracted war with an all-volunteer force will inevitably require outside assistance. This has often occurred in the form of private companies being contracted by the United States to provide assistance with logistics and security. The least stable countries in the world frequently have large tribal communities with more allegiance to the tribe or religion than the country. Global relationships have profound impact on the ground war strategy, particularly when tribes or insurgencies receive support from outside regimes.

In the foreseeable future, the traditional construct of front lines and conventional forces fighting conventional wars will not be the basis for the ground war strategy. The basis for a strategy will consist of projecting forces over strategic distances to conduct security force assistance operations in order to provide stability for states where there are U.S. interests. This will often occur as a COIN operation. While seemingly simple, this is a much more complex

strategy where tactical operations can have strategic effects, victory lacks a definition, and the ends are measured by local national support and stability of the nation. Yet the ground war strategy will always retain some of the principles communicated by Sun Tzu and Clausewitz.

STRATEGY, NAVAL

Alfred Thayer Mahan, the preeminent American naval strategist of the late 19th and early 20th centuries, explained that naval strategy simply denoted "the proper use of means to attain ends" or the disposition of a nation's naval resources to attain agreed-on national objectives. For over a century, the primary strategic objective of the U.S. Navy was the protection of American commerce. Only secondarily did the navy conduct blockades or attempt to protect the homeland from invasion. On rare occasions, during the Mexican-American War and the Civil War, the navy supported its sister service in amphibious operations. Beginning with the 1898

Spanish-American War, the U.S. Navy, because of its increasing might and the influence of Mahan, sought command or control of the seas. This remained an overriding strategic priority during World War II and the Cold War. Since 1989, the navy's strategy has increasingly focused on supporting sister services in regional conflicts such as the Persian Gulf War and the Iraq War, protecting commerce from pirates, providing humanitarian aid, and conducting both offensive and defensive operations as part of the Global War on Terrorism.

From the Revolution to the Spanish-American War

America's first naval strategy developed alongside the small fleet of the 13 colonies and the Marine Corps, which General George Washington requested for the purpose of harassing the British. Far from being a dominant force, the infant American fleet thought little of achieving command of the seas and, instead, played the role of spoiler. At Yorktown, command of the seas proved critical in America's decisive victory, but control of the waters off the Virginia coast was won by a fleet flying the French tricolor rather than the 13 stars and stripes.

Disbanded with independence, the navy was reborn when Congress saw the need for a permanent navy to protect American commerce and, in 1794, appropriated funds for six frigates ranging in size from the 44-gun USS *Constitution* (popularly known today as Old Ironsides) to the 38-gun USS *Constellation*. These six frigates saw extensive service against the Barbary pirates, and while successful in fulfilling their primary strategic role, commerce protection, they encountered insurmountable difficulties when pitted against the Royal Navy beginning in 1812. For most of the war, the British blockaded the U.S. coast and raided targets with impunity.

During the 1846–1848 Mexican-American War, the navy briefly, and successfully, embraced a new strategy, supporting an amphibious attack on enemy shores, when it landed a force of some 12,000 men at Veracruz, Mexico. A little more than a decade later, the navy again focused its resources on protecting American commerce from Confederate raiders while simultaneously blockading the South's ports. The latter strategy, which formed part of the Anaconda Plan, presented daunting challenges in as much as no blockade of such a scale had ever been attempted. The blockade, and the closing of

the Mississippi River, succeeded in ruining the Confederate economy by 1865.

In the interval between the Civil War and the 1898 Spanish-American War, the U.S. Navy underwent fundamental changes that laid the foundations for the emergence of a first-rate maritime power. First, Congress approved funding for three new cruisers, which formed the cornerstone for the "New Navy" of the late 19th century. Two years later, Secretary of the Navy William E. Chandler established the Naval War College, where Captain—and later Rear Admiral—Alfred Thayer Mahan's lectures and writings revolutionized U.S. naval strategy. Mahan forcefully maintained, most notably in his 1890 tour de force, *The Influence of Sea Power on History*, that the United States must build a battle fleet capable of dominating the seas and strategically located choke points, establish overseas or forward bases for the fleet, and create an isthmian canal to facilitate the fleet's rapid movement from one ocean to the other. Perhaps most important, Mahan pressed for a "forward strategy" in which the U.S. Navy would concentrate its forces far from American shores and seek to destroy the enemy in a decisive battle.

The Navy Comes of Age, 1898–1945

The 1898 Spanish-American War both vindicated and acted as a catalyst for the propagation of Mahanian strategy. In the short and decisive conflict, naval strategy focused on securing the waters around the Philippines and the Caribbean, as well as transporting and supplying ground troops in combat far from home. In two pivotal encounters, American commanders put Mahan's decisive battle doctrine to the test. Commodore George Dewey's Asiatic Squadron contended successfully in the May 1 Battle of Manila Bay for control of the waters surrounding the Philippines and, after securing the seas around the archipelago, cooperated with the U.S. Army to transport the ground forces needed to wrest the islands from the Spanish. Half a world away, during the July 3 Battle of Santiago de Cuba, Rear Admiral William T. Sampson's North Atlantic Squadron and Commodore Winfield Scott Schley's Flying Squadron defeated their Spanish opponents, secured the Caribbean, and transported army and Marine Corps units to the battle in Cuba. Victory, and the ensuing Treaty of Paris, provided a new forward base not only in the Caribbean but in Guam and the Philippines as well.

Following its success over Spain, the U.S. Navy took on the strategic obligation of protecting America's new global empire and expanding commercial interests primarily through deterrence, a strategy normally associated with the Cold War. President Theodore Roosevelt used the navy to deter Germany during the 1902–1903 Venezuelan Crisis, and in 1907 he sent the fleet to visit Japan in order to impress Tokyo with American naval power.

While Theodore Roosevelt used the navy as an instrument of deterrence, his distant cousin, Assistant Secretary of the Navy Franklin D. Roosevelt, facilitated convoy and antisubmarine warfare, as well as assisting the British Royal Navy in continuing its command of the Atlantic after the United States entered World War I in April 1917. While it was the British, rather than the U.S. Navy, that employed Mahan's time-honored strategy of fleet concentration at Jutland in May 1916, the United States played a key role in Germany's defeat. By the war's end, the U.S. and British navies safely transported just over 2 million American military personnel to France, which proved crucial in blunting Germany's 1918 spring offensive and allowing the Entente forces to go on the offensive later that summer.

During the interwar period, naval strategy remained firmly within the Mahanian orbit. The 21 fleet-problem exercises that the navy conducted during the interwar years, in which the bulk of available personnel and equipment participated, focused on winning a decisive encounter with an enemy capital ship force to deny the opponent use of the sea. Various versions of War Plan Orange, the plan to fight Japan, were tested, combining Mahan's strategy of fleet concentration in preparation for a climactic naval battle in the Pacific with a blockade of Japan and attacks on the Ryukyus.

During World War II, U.S. naval strategy mirrored both the interwar fleet exercises and the experiences of World War I. The navy, for example, pursued extensive convoy and antisubmarine warfare duties and conducted increasingly successful submarine and, later, surface fleet blockades against Japan. The navy's primary wartime strategy, however, remained securing dominance of the seas. Unlike World War I, the German navy never seriously contended for control of the Atlantic, although its U-boat fleet posed a serious challenge to Allied shipping during most of 1942 and early 1943. In the Pacific, however, the Japanese navy was the dominant naval force from the war's beginning at Pearl Harbor through the

Battles of the Java Sea and the Coral Sea. Only at Midway in June 1942 did the United States, through its destruction of four Japanese aircraft carriers, secure dominance over its Japanese counterpart.

The Cold War

Throughout the Cold War, the U.S. Navy facilitated the nation's overarching grand strategy—containment—and, increasingly, after the Soviet Union acquired nuclear weapons in 1949, a second and related strategy—deterrence. Europe remained the center of conflict throughout the Cold War, and here, the U.S. Army, rather than the navy, had primary responsibility for successfully containing the USSR. The navy, however, had the primary responsibility for keeping the sea lanes open between the members of the far-flung North Atlantic Treaty Organization (NATO) Alliance, and therefore, it developed a strategy for neutralizing the Soviet submarine threat. This strategy envisioned traditional antisubmarine warfare and also the use of nuclear weapons to destroy Soviet submarines before they could put out to sea. Especially during the Eisenhower presidency (1953–1961), the navy embraced a forward strategy in which carrier task forces would strike the Soviet periphery and threaten the flanks of any Warsaw Pact invasion by landing Western forces far behind the advancing enemy. Carrier-borne and, later, submarine-launched missiles also supported nuclear deterrence and the concept of mutually assured destruction by presenting the Kremlin with a credible retaliatory capability.

During the early 1980s, in response to the growth of the Soviet blue-water fleet, Navy Chief of Operations Admiral James Watkins and Navy Secretary John Lehman developed a new comprehensive maritime strategy designed to deter and, failing that, defeat the Soviet navy in a traditional maritime conflict. Key to this strategy was a 600-ship navy made up, in part, of 15 carriers and 100 attack submarines. This preponderance of power would bring victory in the Barents and Norwegian Seas, home to a large force of surface ships and nuclear missile-equipped submarines. The navy also would play a substantial role in a conventional war through the use of new, advanced weapons, including the Tomahawk cruise missiles and "smart bombs" delivered by naval aircraft operating from any number of powerful carrier battle groups. Naval strategists envisioned deploying both weapons in

support of army and marine ground troops defending NATO countries in the event of a concerted Warsaw Pact assault.

During the final years of the Cold War, the Navy returned to pursuing its traditional strategic role of protecting American commerce. The ongoing Iran-Iraq War of 1980–1988 threatened vital oil supplies as Iran laid mines and raided tankers in the Straits of Hormuz. The navy provided an escort for Kuwaiti tankers and took part, along with army, Marine Corps, and air force units, in Operation Praying Mantis, in April 1988, which undertook retaliatory strikes on the Iranian navy for its attacks on neutral shipping. While tensions soon lessened with the end of the Iran-Iraq War, the navy would soon find itself once again deeply immersed in the region.

Persian Gulf War and Post-Cold War Conflicts

In the Persian Gulf War, the navy fulfilled three primary strategic objectives: command of the seas, the use of offensive power in support of operations on land, and sealift of men and materiel. During Operation Desert Shield, the August 1990 to February 1991 military buildup in Saudi Arabia, the navy spearheaded the transporting of nearly 500,000 American troops to the region, successfully blockaded the Iraqi coast, and confused Iraqi strategists by apparently planning a massive amphibious assault along the Kuwaiti littoral. With the beginning of Desert Storm, the February 1991 liberation of Kuwait, naval ships supported ground operations and launched more than 100 cruise missile attacks during the war's first 24 hours alone, while carrier-based aircraft flew 15% of U.S. sorties.

During Operation Enduring Freedom, the assault on the Taliban and al Qaeda sanctuaries in Afghanistan following the September 11 attacks, naval carrier-based aircraft flew three quarters of all sorties in support of ground operations and also undertook extensive efforts to destroy communications and disrupt air defense systems. After the fall of Kabul in November 2001, the U.S. Navy had primary responsibility for the interdiction of terrorists fleeing Afghanistan by sea.

During Operation Iraqi Freedom in 2003, the U.S. Navy once again provided command of the seas, the use of offensive power in support of operations on land, and sealift of men and materiel. With the start of hostilities in March 2003, the navy launched Tomahawk missile strikes against command-and-control centers in Baghdad as part of the “shock and

awe” campaign, designed to show overwhelming power to intimidate the Iraqi forces. Aircraft from the five carrier battle groups assigned to Operation Iraqi Freedom also flew some 14,000 sorties against targets in Iraq and in support of coalition forces.

Post-Cold War Strategy

With the end of the Cold War, U.S. naval strategy shifted from a focus on controlling sea lanes in a global war to fighting regional conflicts, deterring potential enemies, and providing relief. Additionally, strategists since 1990 have focused on littoral or close-to-shore combat, rather than traditional blue-water combat. In terms of potential enemies, strategists have focused on emerging naval powers such as China, regional threats such as that posed by Iran in the Persian Gulf and Straits of Hormuz, and non-state actors such as al Qaeda.

Concerning China, strategy envisions using the navy to blockade the coast in order to deny China access to imports such as oil and, simultaneously, to its many lucrative overseas markets. While ship- and air-launched weapons may be used to target critical military and civilian command-and-control centers, few see a major land war on par with the long-dreaded NATO/Warsaw Pact clash of the Cold War years.

As for Iran, while the navy will play a role in deterring a nuclear strike should Tehran acquire nuclear capability, planners see navy-launched ordnance as an integral part of any campaign to disrupt Iranian command and control, as well as the lead element in a successful blockade of Iran's extensive coastline. The navy would also play an equally critical role in keeping open the narrow but vital Straits of Hormuz, the gateway to the West's crucial oil imports.

In terms of nonstate actors, the navy will do yeoman's service, suppressing piracy in the Horn of Africa as well as off the Indonesian coast in the narrow Straits of Malacca. This focus on pirates, terrorists, and regional state actors such as Iran has, in turn, led the navy to focus on the production and deployment of a new type of vessel, the littoral combat ship (LCS), which will replace America's aging frigates. The new LCS come in two classes, the *Freedom* and *Independence*, and top out at 3,000 tons. Although smaller than the *Knox*-class frigate, the LCS has a maximum speed in excess of 40 knots and is equipped with the navy's new flexible mission packages, which allow for the quick addition

or substitution of specialized equipment to counter various threats, as well as an enhanced, primarily defensive missile capability. Both classes of LCS will counteract submarines, fast-moving small surface craft, and mines. The U.S. Navy had deployed one vessel from each class as of 2012.

In addition to the development of new warships, post-Cold War strategy has placed a much greater emphasis on joint navy/Marine Corps operations and the deployment of carrier battle groups with amphibious strike forces and embedded marines. Strategists foresee the possibility of navy-supported ground forces occupying small portions of the Iranian coast to safeguard navigation through the Straits of Hormuz or to definitely neutralize distant terrorist sanctuaries.

More recently, naval strategy had evolved as part of an effort to integrate naval forces into “global joint operations” in order to effectively combat both regional and nongovernmental threats such as international terrorism. This new strategy rests on three pillars: Sea Strike, Sea Shield, and Sea Basing. Sea Strike envisions using naval power as an offensive weapon, while Sea Shield foresees the navy defending the United States from a host of threats, including cruise and ballistic missiles. Sea Basing emphasizes prepositioning and the use of advanced technology to facilitate the employment of either Sea Strike or Sea Shield. Strike, Shield, and Basing will in turn rely, in part, for success on the many technological advances presented by the information age and will utilize information from a variety of sources, both civilian and military, to identify, track, and target threats worldwide. The navy’s emphasis on harnessing information age advances is embodied in FORCEnet, the navy’s plan for waging network-centric warfare in the 21st century.

In the Cold War era, the U.S. Navy was often seen as complementing rather than leading containment and deterrence; in the 21st century, the navy can play both a leading and a unique role in fulfilling the nation’s grand strategy. Writing in the journal *Orbis*, Swarthmore Professor James Kurth compellingly maintained that in the new century the navy is uniquely suited not only to provide for command of the seas but also to ensure *command of the commons*, the “commons” meaning the seas, “air space, outer space and even cyberspace.”

To carry out this new mission, the navy seeks to maintain a fleet of 313 ships. In 2005, Chief of Naval Operations, and soon to be named Chairman of the Joint Chiefs of Staff, Admiral Mike Mullen

emphasized that given the common danger posed by rogue states, pirates, and terrorists, the United States should seek the formation of an “alliance navy” made up of 1,000 ships from friendly nations.

Conclusion

The strategic objectives of the U.S. Navy have evolved alongside the maturing American republic. From commerce raider and spoiler in the American Revolution, the navy matured in just over a century into a force capable of seeking out the enemy fleet and engaging it in a decisive clash to secure mastery of the seas. Guided by the strategy of Alfred Thayer Mahan and supported by a growing battle fleet and widely dispersed forward bases, the navy has continued to seek mastery of the seas, while simultaneously denying the same to enemy powers. In the two World Wars, and the regional conflicts that followed, the navy has also transported the men and women of its sister services to distant battlefields, supplied them, and protected them with carrier-borne aircraft and precision-guided missiles. In the 21st century, naval strategy has evolved further as the United States seeks to contain new adversaries and deter new threats on the seven seas, in cyber space, and even in outer space.

STRATEGY, NUCLEAR

Soon after the use of atomic weapons at Hiroshima and Nagasaki on August 6 and 9, 1945, nuclear weapons occupied a special position in the arsenal of the United States. Nuclear weapons quickly became disassociated from “conventional” ordnance. The field of nuclear strategy within national military strategy became paramount in national security policy throughout the Cold War. During the early Cold War, the new uncharted reality of a nuclear-armed enemy capable of devastating the United States brought planning of nuclear strategy into the hands of civilian “defense intellectuals.” Although the United States deployed tremendous numbers of warheads, and military leaders advocated their use on occasion, the utility of nuclear weapons in war has vexed every presidential administration as a de facto taboo emerged over their first use in war. Strategic deterrence became the central tenet of nuclear strategy; however, strategic defensive systems and nuclear arms control also were important aspects of strategy.

Prior to World War II, “strategic bombing” doctrine advocates believed that air power could independently affect—even win—a war by destroying key industrial targets. After Hiroshima and Nagasaki, the prestige, tremendous fire power, and coercive potential of atomic bombs quickly devolved into a nuclear arms race. The USSR detonated its first atomic weapon in 1949, and the Cold War took shape. With the USSR as the primary threat, U.S. war plans called for a strategic bombing campaign wielding atomic weapons against military and industrial targets with as many bombs as possible at the war’s beginning.

During the Korean War (1950–1953), President Harry S. Truman withheld the authority to use atomic weapons, to keep the war limited and avoid escalation to a nuclear World War III with the Chinese-Soviet bloc, relegating strategic bombers to dropping conventional ordnance. The Pentagon explored the use of tactical battlefield atomic

weapons; however, the armistice negated the need. After the United States tested a more powerful thermonuclear hydrogen bomb in 1952 and the USSR exploded its own thermonuclear device a year later, a strategy of deterrence took hold.

The Eisenhower administration oversaw a large buildup in the stockpile of nuclear warheads. The phrase “Pentomic Era” is associated with the 1950s and refers to the buildup of small tactical atomic weapons for army battlefield use. The United States also deployed small nuclear weapons for strategic air defense against enemy bombers. Nuclear strategy centered on the public policy of threatening a campaign of “massive retaliation” utilizing large thermonuclear weapons to deter aggression by the Chinese-Soviet bloc. The strategic “nuclear triad” coalesced by 1960 was composed of long-range heavy bombers, intercontinental ballistic missiles, and submarine-launched ballistic missiles. A joint targeting plan, the Single Integrated Operational Plan, derived from the National Strategic Target List, also came into effect over concerns of targeting overlap and overkill. Should deterrence fail and the enemy launch a “first strike,” the Single Integrated Operational Plan envisioned a massive retaliatory “second strike,” although the United States never publicly ruled out a preemptive first strike due to concerns over whether American retaliatory forces could survive a Soviet “first strike.”

The strategic question “What if deterrence failed?” implied the difficulty in determining what success there would be in any U.S. retaliatory strike. Defining “victory” in a nuclear World War III troubled policymakers. The United States would face devastation from an enemy’s first strike regardless of U.S. retaliation, and even if the United States struck first, the few remaining enemy forces would still cause unacceptable losses. The high-stakes nature of nuclear war with its world-shattering “exchanges” of nuclear firepower, and no historical record to guide planners, highlighted the many unknowns in nuclear strategy. With no clear answers on what constituted “minimum deterrence,” continuing the arms race appeared the only answer.

Rise of “Defense Intellectuals”

The critical importance of nuclear strategy induced the rise of “defense intellectuals”—primarily mathematicians, scientists, and social scientists—in the making of nuclear strategy. They derived their work

from “operations research” during World War II to gauge conventional strategic bombing efforts and the maritime commerce war. The academics performing studies of strategy, which came to be known as “systems analysis,” partnered with government to think about the unthinkable—global thermonuclear war—and to advise military and civilian decision makers. The U.S. Air Force took especial interest in such studies and funded the Research and Development Corporation, which became a symbol of the academic-government partnership in strategic studies.

The civilian academics developed “game theory” for nuclear strategy. Notably used by Professors Thomas Schelling and William Kaufman, game theory reduced multiple variables to mathematical formulas. Complex war games could be played out to simulate and produce strategies for nuclear conflict. In the well-known 1960 book *On Thermonuclear War*, Herman Kahn famously argued that in a crisis the best course of action may be a preemptive first strike that limited damage to the United States. This highlighted what many critics saw as flaws in game theory and the mathematical-scientific approach that assumed rational decisions amidst the horrors and unknowns of nuclear war. The defense intellectuals represented by the Research and Development Corporation and many other academics such as Bernard Brodie, author of *Strategy in the Missile Age* (1959), and Henry Kissinger, in *Nuclear Weapons and Foreign Policy* (1957), defined an era where academics held great sway in strategic discussions.

Into the late 1950s, critics often attacked the credibility of a plan for massive retaliation, asking if U.S. leaders would initiate nuclear war in response to a nonnuclear aggression. This criticism stemmed from the concern that U.S. leaders would hesitate to respond to aggression from a communist country because of U.S. heavy investment in strategic nuclear forces and cutbacks in conventional forces. U.S. planners thus designed strategies for limited nuclear war that called for using tactical atomic weapons accompanied by ground troops to respond to a conventional attack by communist forces with greater manpower. By the early 1960s, the Kennedy administration sought options other than relying on the threat of massive retaliation. A buildup of conventional military power offered one solution, but reformers sought a way out of the “nuclear dilemma” that made the United

States vulnerable to unacceptable destruction in any crisis scenario. An “escalation ladder” offered options that sought to coerce a rational enemy to terminate hostilities before the start of a “general nuclear war”—a disaster for all. A public policy of city avoidance by a “counterforce strike” against only enemy nuclear forces could limit the damage to urban population center. The threat against countervalue targets—enemy cities—could then be used to coerce the enemy to end hostilities. Despite these attempts to offer the president more strategic options, most nuclear strategists and military leaders were forced to acknowledge how difficult it would be to stop escalation and accepted that Cold War peace rested on mutual deterrence through second-strike capability, or the ability to respond to a nuclear attack with a similarly powerful nuclear attack. Mutually assured destruction constituted the U.S. strategy—a delicate nuclear balance of terror with “strategic stability” and “stable deterrence” being the goal.

The 1970s brought more complexities to the nuclear dilemma as new technical developments in missile accuracy and payload, such as the multiple independently targetable reentry vehicle, could create instability by posing a threat to the survivability of retaliatory forces. Additionally, the development of anti-ballistic missile (ABM) defenses—utilizing small nuclear devices—exposed the country to the impact of retaliatory forces. Finally, the U.S. strategy faced the challenge of Soviet parity in the arms race.

The 1970s saw a thaw in relations between the United States and the USSR, which was known as détente and resulted in arms control agreements. The Strategic Arms Limitation Treaty (1972) capped the number of warheads and platforms for strategic nuclear forces, and the Anti-Ballistic Missile Treaty (1972) banned most deployments of ABM systems. From the U.S. perspective, the Strategic Arms Limitation Treaty limited damage to the United States, and the Anti-Ballistic Missile Treaty kept stable deterrence in place. The Chinese-Soviet rift and indications in the 1970s that other communist states might not follow the Soviet line in a crisis, prompted planners to offer the president options to delete certain nations from the target list.

The unraveling of détente in the late 1970s following the Soviet invasion of Afghanistan brought renewed calls for strengthening U.S. nuclear forces. The Reagan administration accelerated the nuclear buildup in the early 1980s. Challenging the strategy

of mutually assured destruction, new strategic plans called for the United States to “prevail” in a nuclear war. The strategy defined prevailing as a political result that favored the United States at war’s end. The United States also began researching not just a new ABM system but a missile shield over the entire country, known as the Strategic Defense Initiative, or “Star Wars” in public discourse. By deploying new tactical nuclear forces, NATO sought to assure the Soviet Union that any conventional ground attack on Europe risked escalation to a general nuclear war. The U.S. buildup and Star Wars research reinvigorated the arms race and fueled criticism that the U.S. strategy upset the nuclear balance.

Post–Cold War Nuclear Strategy

The Cold War ended in 1991 due to the Soviet Union’s failing economy and the collapse of the Berlin Wall. The end of the Cold War brought a series of arms control agreements with the new Russian Federation—the Strategic Arms Reduction Treaties. Although tensions with Russia lessened considerably, the focus of nuclear strategy continued to be deterrence by threat of retaliation as the ultimate guarantor of U.S. sovereignty.

The new strategic environment in the aftermath of the September 11, 2001, attacks by the al Qaeda terrorist organization brought new concerns about the effectiveness of deterrence. Deterrent strategy rested on instilling fear in the minds of rational enemy leaders. However, the terror attacks of September 11 were suicide missions conducted with religious fanaticism and designed to kill thousands in a surprise attack. If such an enemy could acquire nuclear, chemical, or biological warheads—weapons of mass destruction—then the old question of “what if deterrence fails” has new meaning. In the administration of President George W. Bush, there were concerns over nuclear proliferation to “rogue” states that might connect with terrorist organizations. Concerns over secret weapons of mass destruction development programs and unsecured “loose nukes” from the former Soviet Union propelled efforts to stop proliferation and to secure nuclear facilities around the world. The United States has the capability to use “bunker busting,” small nuclear weapons to destroy storage facilities for weapons of mass destruction, but it faces the same taboo on nuclear first use that has always muted the utility of nuclear weapons.

Defense against attack by “rogue states” with crude long-range missile capability also revived the National Missile Defense shield into a “Global Missile Defense” system aimed at limited strike capability from small hostile states such as Iran and North Korea. In 2002, the United States withdrew from the Anti-Ballistic Missile Treaty with Russia. This has brought criticism over destabilizing the strategic balance and undermining the new arms control agreements. The contemplated, though now cancelled, attempt in 2008 to base part of the ABM system in eastern Europe among the former communist states further strained relations and brought fears of a new nuclear arms race, though the Cold War had long been over.

Nuclear strategy in broad terms has changed little since 1945. Studied by legions of defense intellectuals, nuclear weapons developed a taboo on their use in war and derived their importance more from deterring large-scale conflict between the superpowers—thus preventing World War III. Deterrence posed the risk of unacceptable destruction to both sides in a future conflict. Despite the new strategic environment after the end of the Cold War, the advent of the Global War on Terror, and the actual deploying of a limited Global Missile Defense, threat of retaliation remains a key part of U.S. nuclear strategy.

SUBMARINES

The idea of an underwater vessel capable of attacking an enemy ship has been around for some time, but it was only in modern times that it came to fruition as the submarine. Modern submarines can submerge and surface at will. It was only after World War II that modern submarines were built—nuclear vessels that never need to surface to operate over long periods of time under the seas. In today's maritime security environment, navies use both diesel-electric and nuclear submarines for all the missions traditionally performed by fleets throughout history—sea control, power projection, and sea denial—and also as nuclear deterrents for those nations equipped with nuclear weapons. Additionally, nonstate entities like narco-traffickers

and smugglers use them to move illicit cargo on an increasing basis every year.

History

The idea of an underwater boat had been around for centuries, if not millennia. From the realm of legend comes the story that Alexander the Great ventured under the water in a “glass case” in 332 BCE. The study of the history of the submarine is closely tied to another technology—the underwater explosive. Any history of the submarine must include a parallel history of its intended “punch.” Through the centuries, these ideas developed concurrently, and it was during the American Civil War that the first true submarine warship was deployed. The Confederate-sympathizing Horace L. Hunley decided to produce a vessel that could break the Union blockade of the South. The result was the CSS *Hunley*. On a fateful night in February 1864, the submarine sank the USS *Housatonic* in the vicinity of Charleston, South Carolina. It was the first such successful attack in history; however, the *Hunley* and its entire crew were subsequently lost.

It was only with the development of the compressed air-propelled torpedo that a weapon commensurate with the promise of a submerged warship was realized. The Irish inventor John P. Holland produced a submersible boat in June 1900, initially to use against the British. Holland took his ideas to America, where he eventually became a citizen. He decided to play on American fears and entered a competition for his design to become the standard design of the U.S. Navy. Holland won, and the Navy decided to buy his invention.

Holland's boat was truly revolutionary. It included all of the elements that were standard on submarines until the advent of nuclear power: torpedoes and tubes, a small deck gun, a periscope system, battery power for underwater propulsion, and an oil-fuel engine for surface use and for recharging the batteries. Holland's company, Electric Boat, was not restricted in its sale of the technology, and the weapon was so revolutionary that it was not long before all the major navies, including the British Royal Navy, were buying submarines. Their first use, though, was as a sort of underwater manned mine delivery vehicle meant to protect harbors and harbor approaches. Its initial low speed of 4–6 knots (especially underwater) prevented its practical use elsewhere. This first modern submarine's purpose was essentially defensive.

With the advent of the Great War in 1914, the submarine blossomed into something more. Its use in combat, as foreseen by naval visionaries like Admiral Jackie Fisher, was as a submersible torpedo boat whose principal job was to serve as a manned, stealthy vessel that would force a hostile opponent to navigate very carefully around the coastal waters of an adversary. Soon the British submarine force was ranging far and wide, to the very gates of the German High Seas Fleet near the Jade River. The Germans put the new weapon to its most effective use during the war as a stealthy commerce raider (U-boat) that stalked its prey at night in the approaches to the British Isles. The key German advance in submarine technology included the use of multiple diesel engines as both the primary propulsion system for the vessel and the recharger for the batteries, which were used only underwater. Recharging usually occurred under the protection of night. Use of the submarine in this role was allowed by international law as long as submarines followed the rules of cruiser warfare: a request to board, a proper search, and ensuring the safety of the crew. In

following these rules, however, the submarine gave up its biggest advantages, stealth and surprise. The German U-boat campaign started out conventionally, but before long mistakes by overeager captains and the fog of war led to accusations and incidents of violation of the laws of war. In 1917, the desperate Germans launched an all-out unrestricted U-boat campaign meant to win the war. Only the U.S. entry into the war kept the Allies on their feet long enough to recover and win.

Also serving as a U-boat commander in the Mediterranean was a young *Kapitan* named Karl Doenitz. After defeat and the elimination of the German U-boat fleet by the Treaty of Versailles, the peace treaty at the end of World War I between Germany and the Allied Powers, Doenitz was among the few officers retained by the tiny *Reichsmarine* of the Weimar Republic. Doenitz realized that the Allies had won against the U-boat by massing their merchant ships with destroyers in convoys. He decided that the best tactic to defeat them would be to mass his U-boats in "Wolfpacks," and he practiced his new tactics using torpedo boats since Germany was not allowed to have submarines under the terms of the Treaty of Versailles. When Adolf Hitler came to power, Doenitz was able to build U-boats, and in 1939, the U-boat war began again, leading to a 6-year battle between German submarines and British-American convoys. The tactics, techniques, and procedures developed during the Battle of the Atlantic became fundamental to how submarine warfare was practiced until the end of the Cold War, especially the use of sonar and radar-equipped patrol aircraft as well as Anti-Submarine Warfare task groups built around small aircraft carriers.

In the Pacific theater of World War II, the U.S. Navy's submarine force proved the concept that an unrestricted submarine campaign could be a component of a war-winning maritime strategy, in its war with the empire of Japan. *Gato*-class fleet submarines, meant for screening and picket duties for the battleships, were given new mission orders on December 7, 1941, to conduct unrestricted submarine warfare against the "dastardly" Japanese. The "silent service" managed to sink more than 6 million tons of Japanese shipping by the war's end.

The submarine came out of World War II as one of the most effective weapons a navy could build. During the later war years, the German use

U-boat stranded on the south coast of England after surrender. Crowds, some in rowboats, gather around the beached submarine while others congregate on the submarine's deck. Photograph taken sometime between 1914 and 1918.

of a snorkel system that allowed the submarine to recharge its batteries below the surface had partially solved the issue of submarines having to surface; however, submariners still wanted complete autonomy, and the Germans experimented with a hydrogen fuel cell submarine. Meanwhile, after the war, the Americans pressed ahead with nuclear propulsion, a true revolution in military affairs for submarine propulsion, under the leadership of visionaries such as Captain Hyman Rickover and Admiral Arleigh Burke. In 1954, the United States produced its first nuclear-propelled submarine, the USS *Nautilus*. During the Cold War, the primary role for submarines was changing from the hunted

to the hunter of submarines. From this point on, the United States led the world in nuclear submarine design and development. The naval revolution continued with the addition of nuclear-tipped ballistic missiles (Polaris) aboard the USS *George Washington* in June 1959. The transformation of the partial submarine into the self-contained nuclear strategic weapon it is today was complete. The submarine could not only blockade, it could now destroy cities. The history of much of the Cold War involved the United States, its allies, and the Soviet Union in a nuclear submarine arms race that came to a head during the Reagan administration in the 1980s with the immense *Ohio* class (United

Divers and crewmen of the U.S. Navy's seagoing tug *Ortolan* fasten a midget Japanese submarine to the side of their ship, July 1943.

Source: U.S. Navy.

States) and *Typhoon* class (USSR) of ballistic missile submarines. These classes of submarine are still in the active inventories of U.S. and Russian navies today.

Submarines Today

Since the end of the Cold War, the submarine remains a primary tool in the arsenals of all modern fleets. In the U.S. Navy, the end of the war resulted in greater integration of the entire submarine force into operations with the surface forces. Russia still maintains a formidable, but aging, nuclear submarine force, as does the People's Republic of China. Russia's arsenal includes ballistic missile submarines of the *Typhoon* class, as well as a wide variety of diesel and nuclear attack and cruise missile submarines. Most infamous among these was the nuclear cruise missile submarine *Kursk*, which exploded in 2000, destroying the submarine and killing the entire crew. China's People's Liberation Army Navy now has the

largest number of submarines in the world, although most of them are of the diesel variety, of the *Song* and *Ming* type classes. The *Songs* are not much different from the 1980s-level technology and are classified as a diesel attack submarine (SS), while the *Ming* are armed with antiship cruise missiles similar to the French *Exocet* designs. This large diesel force composes the bulk of the Chinese navy and is designed to do what the original submarines of Holland were intended to do—defend harbors and coastal waters.

However, the undersea world is developing new technologies such as air-independent propulsion, especially in Sweden, which lent one of these types to the U.S. Navy to work with in the first decade of the 21st century. This technology makes for a quieter submarine than even the quietest of diesels. Among the newest of these quiet submarines is U-31 of the German *Bundesmarine* (Federal Navy). It is a double-hulled vessel and also uses air-independent propulsion like the Swedish submarine mentioned earlier. The double hull makes it both quieter and more survivable.

These quieter, nonnuclear propulsion technologies pose real challenges to the nuclear behemoths that are still the backbone of the world's most modern submarine force—that of the U.S. Navy. The U.S. Navy employs three types of nuclear submarines: (1) the fast-attack boat, (2) the ballistic missile submarine, and a new type known as the nuclear-powered cruise missile submarine, or SSGN—denoting submarine, guided missile and nuclear powered. The fast-attack types (SSN), the older *Los Angeles* and newer *Virginia* classes, perform the types of mission most people associate with submarines, attacking surface ship targets, launching Tomahawk land attack cruise missiles, or hunting other submarines. The nuclear ballistic missile submarines (SSBN) are the capital ships of any major navy when it comes to nuclear deterrence, and once one of the *Ohio* class puts to sea, it has as much nuclear “throw weight” as any nation besides the United States, Russia, or China. Finally, the SSGN class is a true undersea “arsenal ship” that can carry miniature submarines for naval special warfare insertion (involving members of the Sea, Air, and Land teams, or SEALs) as well as more than 100 Tomahawk land attack cruise missiles. These missiles can attack targets hundreds of miles inland by using satellite guidance. Additionally, SSGNs can perform all of the missions a fast-attack

The USS *Nautilus* was the world's first nuclear-powered submarine.

Source: U.S. Navy.

submarine can by using the latest in smart torpedo technology.

Other nations, too, continue to build nuclear submarines. Great Britain recently completed the first in a new class of nuclear attack submarine—the HMS *Astute*—in 2010. China, too, is building newer nuclear missile and attack submarines to replace her aging *Han* (SSN) and *Xia* (SSBN) submarines.

Submarine warfare recently flared up when a probably North Korean *Yeono*-class miniature submarine, not much different from the Japanese miniature subs that attacked Pearl Harbor, sank the South Korean naval vessel *Cheonan* (PCC-772) in the Yellow Sea in 2010. Most recently, in Libya (2011), North Atlantic Treaty Organization submarines launched Tomahawk land attack cruise missiles, a mission called strike warfare in joint U.S. military doctrine, attacking Muammar Qaddafi's

air defense systems. Because of their stealth, submarines remain one of the most effective warships a modern navy can acquire, although training and keeping the readiness of submarines high is an expensive and time-consuming process. Captain Henry Hendrix of the U.S. Navy recently wrote that “submarines have become the international flavor-of-the-month with regard to nation-state security.” Naval combat in the 21st century will likely include submarines, probably as the major component in most engagements. The submarine may have in fact become the “coin of the realm” for sea power in the 21st century, perhaps replacing aircraft carriers and surface ships.

SUICIDE

Suicide, the intentional taking of one's own life, has traditionally been condemned by Judaism, Christianity, and Islam. At the same time, in some circumstances societies embracing the traditions of the world's three major religions have sometimes encouraged suicide. In the 19th and early 20th centuries, German military officers facing disgrace and court-martial were often encouraged by senior leaders to commit suicide. Many Islamic extremist groups in the Occupied Territories of Palestine have recruited individuals to carry out suicide attacks against Israeli civilians and military targets.

In the Eastern tradition, there are instances in which suicide has been embraced. Until the practice was suppressed by British colonial officials, Indian widows traditionally immolated themselves in the funeral pyre of their husbands. The Japanese

military inculcated a warrior code, Bushido, that viewed surrender as dishonorable and last-ditch suicide attacks in the island campaigns of the Pacific in World War II as honorable. By 1944, when the Japanese strategic outlook worsened, the Japanese navy and airforce had created specialized suicide units, kamikazes, to attack American forces with human-guided torpedoes and airplanes.

The U.S. Military

Suicide has never been embraced by the American military, and norms in this regard reflect those of the wider American society. For instance, the United States never created suicide units, and military commanders have surrendered to enemy forces when the situation became hopeless. During the War in Afghanistan and the Iraq War, the increased rate of suicide among American military personnel, especially those serving with the army, has raised concerns among military leaders, the families of combatants, and the wider public. Between 2001 and the middle of 2012, more than 2,676 military personnel have died from suicide, compared with 1,950 combat deaths in Afghanistan and 4,486 in Iraq. According to preliminary estimates from the Pentagon, there were 349 military suicides in 2012, the highest number since the Pentagon began tracking suicides in 2001 and greater than the number of combat deaths in Afghanistan (see Figure). Although suicide rates among male military personnel have historically been lower than those for the general population, they increased during the wars in Iraq and Afghanistan and now surpass the rates for society at large (Ruiz, 2012).

While they make up 85% of the military, men constitute 95% of those who commit suicide. Those who take their own life are most likely to be enlisted personnel, White, and below the age of 25. Suicides caused by guns are the most common (true for the military and the civilian sector), with drug overdose coming second and the cutting of one's veins or arteries third. Suicide tends to be attempted in home environments.

The stress faced by a frontline soldier is certainly a frequent cause of suicide, but a substantial percentage of victims do not witness combat. Moreover, most suicides do not take place during actual deployments abroad, and experts posit that small-unit cohesion plays a role in this regard. Comradeship when deployed serves to limit alienation for those with a propensity for suicide and reinforces the feeling that they must not let their buddies down. Mental health issues are most prevalent among the members of the National Guard and Reservists, in part because they lack access to the mutual support that active-duty personnel have in a regular unit.

Posttraumatic stress disorder has been shown to play a role in a significant portion of suicides. Studies show that one out of five U.S. combat personnel who served in their nation's most recent wars in Iraq and Afghanistan reported signs that indicated the presence of posttraumatic stress disorder on their return home. Many returning soldiers engage in alcohol and drug use, often to self-medicate, rather than seeking professional assistance. Marital strain and difficulty reintegrating back into family life play a role in some instances, but many families of those committing suicide have complained that the military has not paid enough attention to larger,

Figure 1 Number of Military Suicides per Year

systemic causes, such as posttraumatic stress disorder and the lack of adequate support systems.

Cultural norms and attitudes toward mental health care have traditionally discouraged servicemen and servicewomen from availing themselves of mental health care. With limited success, senior leaders have sought to discourage the stigma attached to psychological counseling. To prevent soldier suicides, the army started a program formerly called Battlemind, now called Resilience Training, to prepare soldiers for the mental pressures of serving on the front lines. In addition, family members are prepared for long separations; likewise, soldiers are taught how to reintegrate themselves back into society after serving in combat. The primary thrust for Battlemind was not to prevent suicide, and the army has not collected information regarding whether the program prevents soldiers from killing themselves. The army has recast this program as "Resilience Training," though the core concepts and goals remain largely the same.

Recently, the Pentagon has provided more funding for in-depth screening procedures; once a psychopathology has been detected, the individual can receive therapy. The Department of Defense utilizes a postdeployment health assessment as well as postdeployment health reassessment programs, both of which are designed to identify any physical and/or mental difficulties in soldiers returning home after serving in combat.

Warning signs for soldier suicide include reliving traumatic events through recurring bad dreams and/or disturbing memories, the complete evasion of anything affiliated with the experience, and a heightened state of awareness (e.g., inability to sleep, irritability). A strong social network can help alleviate some of the stress soldiers feel on returning home.

The contemporary high rates of suicide offer another reflection of the human toll of the wars in Afghanistan and Iraq. In contrast to the conscript wars of the 20th century—World War I, World War II, Korean War, and Vietnam War—only a small percentage of the American population has borne the burden of multiple deployments into combat zones in the most recent conflicts. In both World Wars, the American military faced staggering numbers of soldiers who experienced what has been termed battle fatigue and shell shock. The numbers plummeted dramatically when the military implemented rotation of service personnel out of combat and provided better health care. But the current high rates of

suicide suggest that the military needs to devote more resources and find new ways to assist servicemen and servicewomen to cope with the mental toll of war.

SUN TZU

Despite his fame as the reputed author of *The Art of War* and an extensive biography in China's first comprehensive history, Sun Tzu (the Shiji, Sunzi, or Master (zi) Sun of the late 2nd century BCE) remains an enigma. Moreover, the absence of his name in any of the records that chronicle the late Spring and Autumn Periods (722–481 BCE) has not only stimulated doubts about his activities and achievements but also prompted questions about his very existence.

A contemporary of Confucius, Sunzi apparently numbered among the early itinerant political advisors and military strategists who sought employment with the era's increasingly despotic monarchs. When he suddenly appeared in the troubled southeastern state of Wu about 512 BCE, Holu, the usurper, retained him as part of his efforts to revitalize the state and prevent its annihilation by its nemesis, the powerful state of Chu to the west. The key factor in his appointment was a highly melodramatic (and no doubt apocryphal) demonstration of improved

organizational methods that promised to magnify the army's power.

Pressed for proof, Sunzi arrayed the palace's female attendants into a drill formation before appointing the king's two favorite concubines as group captains. When, despite repeated instruction, the women continued to laugh rather than implement his orders, he had the captains executed, instilling the terror necessary to parade the other attendants about at will. Despite being enraged, the king perceived the potential of draconian military discipline and refrained from beheading him.

Judging from *The Art of War's* contents, Sunzi directed his efforts toward core concepts, organization, operational tactics, and fundamental strategic issues rather than the formulation of national strategy. Living at the end of a period of increasingly lethal internecine strife that saw dozens of proto-states extinguished and the gradual emergence of 12 strong entities that coexisted in an unremitting state of enmity, Sunzi was acutely aware of the need to consciously examine the patterns of warfare. Survival depended on insightful leadership, economic prosperity, increasing the populace, and sound military measures. Furthermore, because of the multiparty nature of the threat, any engagement, whether successful or not, might fatally weaken the state. Thus, *The Art of War* commences by proclaiming, "Warfare is the greatest affair of state, the basis of life and death, the Dao to survival or extinction."

Rather than being a discursive treatise, China's oldest surviving military writing was created by compiling hundreds of laconic pronouncements written on individual bamboo strips, the media of the era, into thematic chapters under general rubrics such as strategic power, maneuver, and configurations of terrain. It remains unknown whether it was largely composed by Sunzi, compiled by his disciples in the century after his death, written by Sun Pin, one of his distant descendants, or written by other unknown persons. Already noticeably influential late in the Warring States period (403–221 BCE), it soon acquired numerous commentaries, including the earliest known by the obstreperous Cao Cao, and underwent centuries of editing.

The Art of War reflects evolving concerns inherent to increasingly lethal Spring and Autumn warfare: mobility resulting from chariot multiplication, segmentation and deployment, battlefield control, escalating infantry forces, martial professionalization, and extended campaigns resulting in clashes

between tens of thousands. Nevertheless, the concepts, principles, and tactics have generally transcended historical limitations.

Within China's lengthy tradition of military science, *The Art of War* initiated rational speculation on martial principles and concepts, transforming combat into an art or proto-science rather than a mere exercise in force and brutality. It not only became the progenitor for all subsequent Chinese military thought but also remains a key resource in the People's Republic of China's quest to develop military science with unique Chinese characteristics. The book's teachings continue to affect every realm of modern endeavor; its concepts and pronouncements, such as "Know the enemy and know yourself," pervade contemporary Chinese life and media.

Despite its pastiche nature, the book embodies a primary vision that might be summarized as the practice of efficient warfare. Thus, in accord with the behest that "subjugating the enemy's army without fighting is the pinnacle of excellence," Sunzi believed that "the highest realization of warfare is to attack the enemy's plans; next is to attack their alliances; next to attack their army; and the lowest to attack their fortified cities." However, whenever an enemy must be engaged in battle, every action should be devoted to achieving victory.

In accord with the fundamental tenet that victory must be achieved before initiating combat, extensive intelligence must be gathered to accurately assess the prospects for success. Opponents should then be manipulated through lures and enticements, and deceit and deception to weaken, dispirit, and enervate them. Their forces should be dispersed and the battlefield structured so as to produce the localized but significant tactical superiority that will ensure an "easy" victory.

Several significant concepts underlie *The Art of War*, including configurations of terrain, deception, strategic power, and the highly complex idea of the unorthodox. Commonly recurring physical features need to be recognized, their constraints observed, and their limitations exploited. Tactics need to be constantly varied, the army needs to be formless, and the general should be unfathomable to compel the enemy to plan for every contingency. But it is deception that is the very "Dao of warfare" as well as a crucial factor in implementing unorthodox (*qi*) measures that, in conjunction with wisdom and planning, provide the means to unexpectedly vanquish significantly stronger foes.

However, ultimately *shi*—the “strategic configuration of power”—must be employed to defeat the enemy. A concept that entails not just simple might but instead integrates positional advantage, weapons, leadership, training, and combat spirit (*qi*), it is imagined as a “millstone crushing an egg” or a roiling river carrying stones before it.

The Art of War also contains two focused chapters, the infamous “Employing Spies,” on the nascent practice of spycraft, and “Incendiary Attacks,” on the principles and tactics of incendiary warfare. The first theoretical manuals on these subjects, their inclusion clearly stemmed from the importance of spies in acquiring intelligence and spreading disinformation and from incendiaries being the only vehicle for inflicting extensive damage in an era of singular combat.

SUPPORT GROUPS FOR MILITARY SPOUSES

All members of the military branches of service—army, navy, marines, air force, and Coast Guard—need more than uniforms, meals, arms, and other military equipment. They also require psychological, familial, and social support and the knowledge that their families are being supported as well.

Origin of Support Groups

During wartime or peacetime, troop members carry with them family concerns, problems, issues, and commitments just as nonmilitary workers do. The national government, through the armed services, supplied equipment for keeping the troops at their tasks but did nothing for their nonmilitary needs until recently. Support for military families has been traditionally the task of the private sector. Families, private organizations, and individuals historically

have provided services, both material and psychological, to the fighting forces. In years past, single men were preferred as military recruits. Men who married while in the service were discouraged from reenlisting. Spouses and other family members who trailed after the army were called “camp followers.” It was they who provided services to the troops. Only in the mid-20th century did the national government recognize that military families outnumbered the members of the armed forces. The government finally acknowledged the vital role that military families filled in providing psychological well-being as well as physical comfort to members of the armed services. In addition, better communication technology provided access to link military families to one another.

Just prior to World War II, at the request of President Franklin D. Roosevelt, the United Service Organizations (USO) was founded to provide recreation and entertainment for the military. Roosevelt believed that the social needs of the armed services could be best provided by private organizations rather than by the federal government. Several organizations joined together to form the USO. The six civilian agencies were the Salvation Army, Young Men’s Christian Association, Young Women’s Christian Association, National Catholic Community Services, National Travelers Aid Association, and National Jewish Welfare Board. After 30 years, the USO expanded its services to include involvement with local community groups in order to offer assistance to soldiers returning to civilian life. A decade later, the USO was active in promoting civilian interest in the welfare of the military.

The Department of Veterans Affairs, earlier called the Veterans Administration, was established in 1930, but its primary mission was directed toward the veterans themselves. It is only recently that the families of veterans received services.

Internet Creates Change

During Operation Desert Storm, the USO established a “mobile canteen program” on four-wheel-drive vehicles carrying refreshments, books, magazines, video and compact disc players, and other resources for recreational pursuits. In addition, the USO established a Family Support Fund to support military families who suffered hardships from the deployment or death of a service member.

The National Military Family Association (NMFA) is among the more prominent of the organizations providing support services. NMFA was founded in 1969 during the Vietnam War as the Military Wives Association because a small number of military wives wanted to ensure that their widowed friends were properly cared for. On its website, the group proudly describes itself as military families supporting military families. It also speaks up on behalf of military families and empowers husbands, wives, and children to understand and access their benefits.

The webpage has many links offering assistance via information on benefits, mental health care, deployment, and spousal education, among other topics. While providing these programs and other facts, this organization offers a way in which families can get involved more actively by participating in policy issues. Interested individuals, as well as military families, may join the organization for a modest annual membership fee.

In addition to the NMFA, there are various membership-run groups, such as the Internet-based Military OneSource, which offers assistance tailored to active-duty personnel and families in each branch of the service, the army, navy, marines, air force, and Coast Guard, as well as the National Guard and reserve. In addition to the family and traditional social services assistance provided by Military OneSource, social networking is also included: There are links to Facebook, Twitter, Pinterest, Flickr, and YouTube on the NMFA website. Free online courses are available on topics such as Internet safety for kids, retirement planning, battle-mind training for spouses, money matters, and managing deployment.

Military.com began in 1999 and boasts an association of 10 million in its no-fee membership roster. The website includes links to the Armed Services Vocational Aptitude Battery preparation, benefits information, and military associations.

Since 1950, the Association of the United States Army, a private, nonprofit educational organization, has supported America's army comprising active-duty personnel, the National Guard, the reserve, civilians, retirees, government civilians, wounded warriors, veterans, and family members. The Association of the United States Army provides professional development opportunities at a variety of local and national events. There are similar organizations for other service branches: the Air

Force Association and the Association of the United States Navy.

Conclusion

The term *military* may conjure up rows of service people in identical uniforms, indistinguishable from one another. Often this sameness obscures the fact that each one is an individual with social, family, psychological, physical, and spiritual needs. There are several organizations that reach out to military families via the Internet. Now it is much easier for military families to find and communicate with each other. All the electronic means of communication have made it possible to do away with the isolation of military families.

SURGE, IRAQ WAR

In the 2006 U.S. midterm elections, the Republican Party lost control of both houses of Congress, largely because of voter dissatisfaction in the “swing” states with the conduct of the Iraq War up to that point. Soon after, President George W. Bush took the advice of a cohort of retired general officers and security intellectuals, several of whom were affiliated with the American Enterprise Institute, a conservative think tank, and initiated a “surge” of U.S. forces in

Iraq. These individuals had argued that to create the fundamental preconditions for an orderly U.S. liquidation of the Iraq War—"reconciliation" between Iraq's Shia and Sunni political leaders and demobilization of their associated militias—the president needed to *temporarily* increase the number of combat brigades in Iraq from 15 to 20 and task them with suppressing the militia-driven intercommunal violence in Greater Baghdad. The five additional brigades increased American troop levels from 137,000 to 168,000 between December 2006 and November 2007.

The surge depended, for whatever success it may have achieved, on five mutually supporting factors, in addition to the Bush administration's decision to temporarily increase troop levels. These were the reorientation of U.S. Army and Marine Corps commanders within Iraq toward a counterinsurgency posture; the Shia cleric Moktada al-Sadr's decision to cease armed resistance to the occupation; the Sunni Arab "Anbar Awakening," which neutralized al-Qaeda in Iraq; Syrian, Saudi, and Iranian reduction of the flow of "foreign fighters" into Iraq and, in the case of Iran, reduction of its material support to Shia militias within Iraq; and, finally, the cumulative decision of thousands of Iraqi security force members to cooperate with the coalition forces despite the appalling risks and to operate as national, not sectarian, servants. After 2006, virtually all actors throughout the region decided that the surge's objective would serve their various interests better than an indefinite U.S. occupation, with the near-term possibility of an irreversible fragmentation of the Republic of Iraq. Indeed, the increase in the troops deployed to Iraq may have been the *least* important factor in the reduction of intercommunal violence. Less easily quantifiable factors such as the Anbar Awakening or the decisions reached in Damascus and Tehran may have been of equal or greater importance. Furthermore, those factors probably began to operate well before President Bush announced the surge on January 10, 2007.

During 2006, a team of soldier-scholars met at the behest of Lieutenant General David Petraeus in Fort Leavenworth, Kansas, to review the foundational studies of David Galula, Roger Trinquier, and Sir Robert Thompson and distill the fundamental principles of a successful counterinsurgency (COIN) campaign. These are as follows:

- The counterinsurgent government's goal must be a politically and economically viable nation-state with a reasonably effective and honest central administration.
- The government's security forces, both military and police, must operate within whatever legal structures preexisted the outbreak of the insurgency: Justice must apply equally to both detained insurgents and security personnel suspected of illegal violence.
- The government must integrate all civil and military functions that address the causes of the insurgency into a single, unified national effort.
- Security operations must center on dismantling insurgent networks; killing individual insurgents is secondary.
- Finally, the government must secure the districts in which its authority is strongest, its "base areas," before transitioning to clear and hold operations to pacify insurgent strongholds; military units must never leave a "cleared" area without transitioning the "hold" mission to loyal police forces.

These five principles synergistically support the single, overarching objective in COIN: the separation of the insurgency from the population and the protection of the population against insurgent remobilization. Fortuitously, Petraeus, after overseeing the process that resulted in Field Manual 3-24, *Counterinsurgency*, December 2006, was selected by Bush to put that revised doctrine into effect as commander, Multi-National Force-Iraq, during the surge, supported by Lieutenant General Raymond Odierno as commander, Multi-National Corps-Iraq, who supervised daily security operations.

In terms of specific techniques, the surge witnessed a dispersion of combat battalions away from large, forward-operating bases, or "FOBs," to a larger number of smaller, company- and platoon-sized combat outposts, or "COPs," typically located in abandoned commercial buildings and police stations within Baghdad's most violent neighborhoods. Combat outpost units foreswore the vehicle-borne operations that had suffered so many casualties from improvised explosive devices (IEDs), turning instead to dismounted "cop-on-the-beat" patrols, which were better able to gather actionable, real-time intelligence. Infantrymen and U.S. special operations

teams continued to conduct cordon operations and raids on specific locations, but these were increasingly based on raw intelligence processed through new “pattern analysis tools,” such as “social network analysis,” which gave commanders greater confidence that the individual being sought for detention was actually a “bad guy” and in the house being targeted.

Meanwhile, Petraeus had authorized the formation of lightly armed self-defense militias in Shia and Sunni neighborhoods, which were generally referred to as “concerned local citizens,” or “Sons of Iraq.” Predominately one-sect neighborhoods were walled off for their protection where necessary by modular, 20-foot-high concrete blast or “T” walls. These, combined with basic entry controls, enabled local men to defend their own homes against nocturnal death squads and vehicle-born IEDs. By the late spring of 2008, a drop in violence reversed the pre-2007 slide toward generalized sectarian warfare. As each successive month witnessed fewer civilian deaths, and as the Iraqi army increased its ability to supplement (and, by implication, eventually replace) U.S. troops in security tasks, Iraqis of all identities pressed their leaders to make the immediate political compromises necessary to maintain each successive improved state of civil order.

The surge can best be understood as a simultaneous *increase in* U.S. forces in Iraq and a *reposting* of those forces, in a campaign that foregrounded the five principles of counterinsurgency. It was effective enough, as evidenced by the reduced sectarian killings and attacks on U.S. forces, to induce other regional powers to abjure from actions that would have further destabilized the U.S. occupation, while also convincing Iraqi officers in the army and National Police of the necessity to purge their ranks of sectarian actors and function more as a *national* security establishment. This gave Prime Minister Nuri al-Malaki the opportunity to launch an unexpectedly successful effort to clear the southern city of Basra of rogue Sadrist forces between March and April 2008, just as a new equilibrium had emerged in Baghdad.

In July 2008, intercommunal violence and IED attacks on coalition forces dropped to their lowest levels in more than 2 years, justifying a reduction to 14 combat brigades by December 2008. U.S. troop levels continued to fall throughout 2009, as did the violence, and the remaining U.S. brigades assumed an “advise and assist” role, in which they

retained their tactical organization but increased their efforts to mentor Iraqi security forces. The army designated the surge as the fifth phase of the Iraq campaign, lasting from January 10, 2007, to December 31, 2008, followed by an “Iraqi Sovereignty” phase, between January 1, 2009, and August 31, 2010, and “Operation New Dawn,” after September 1 of that year.

The question of the success or failure of the surge must be distinguished from the more important questions of the wisdom, legality, and success or failure of the larger war in which it occurred. It is best understood *not* solely as an increase of troops but as a package of new initiatives within a revised COIN doctrine *supported by* an increase in troops. It significantly reduced violence, which permitted the 2009–2011 drawdown and the eventual exit of all remaining U.S. troops from Iraq on December 18, 2011. However, as of that point in time, the government of Iraq had failed to assume the honest-broker role envisioned in COIN theory, being effectively a Shia regime governing for the benefit of the Shia majority. Nor had it effectively established a national rule of law or struck the petroleum resource bargains necessary to eliminate the possibility of an eventual Kurdish secession from the Republic of Iraq. The possibility thus exists of a return in the near or medium term to sectarian violence and national disintegration or, conversely, the subordination of Iraqi sovereignty to an emergent regional hegemon. Should either of those outcomes occur, the surge would have simply delayed the failure of the U.S. effort in Iraq.

SURGEON GENERAL, AIR FORCE

The U.S. Air Force surgeon general is the senior-most physician officer in the air force. In most cases, the rank afforded to the surgeon general is lieutenant general. The surgeon general's primary responsibility is to command the Air Force Medical Service (AFMS). With main offices located in the Pentagon, the air force surgeon general can be seen in all parts of air force military operations and commands.

History

In 1947, the U.S. Air Force separated from the army. Several primary functions continued to fall under the purview of the army, including medical services. In 1948, the newly formed air force, along with the air surgeon (Major General Malcolm C. Grow), convinced the U.S. Army and the Truman administration that the air force needed its own medical services. In 1949, Air Force General Order 35 established medical services in the following areas: Medical Corps, Dental Corps, Veterinary Corps, and Nursing Corps, among others.

In 1949, Secretary of Defense Louis Johnson directed that "aeromedical evacuation" become the preferred method across the armed services for carrying casualties long distances for evacuation. This directive not only solidified the place of the AFMS but also changed medical history for the armed services.

The Korean conflict (1950–1953) witnessed yet another change in medical services. The army assumed responsibility for frontline medical helicopter evacuations, while the AFMS used a variety of fixed-wing transport aircraft for aeromedical evacuation.

As early as the 1950s, medical service members at Holloman Air Force Base conducted tests to determine human responses to high G-force, using both rockets and high-energy aeronautical vehicles.

Largely based on methods perfected during the Korean War, the AFMS was instrumental in publicizing the possibilities aviation medicine offered to the American Medical Association. By the middle of the 1950s, the AFMS had created the first iterations of air-transportable hospitals. Subsequently, in the latter portion of the 1950s, the AFMS continued to conduct high-altitude studies at Holloman Air Force Base. In 1959, the U.S. Air Force changed the name from "aviation medicine" to "aerospace medicine," to

reflect the changing nature of air-medical strategy and technology. In 1964, this new designation would be acknowledged by the American Medical Association.

From 1965 to approximately 1970, many AFMS hospitals, schools, and laboratories supported NASA's space programs through the ongoing research conducted at Holloman Air Force Base. For example, the aviation physiology program supported the first U.S. high-altitude reconnaissance flights in the late 1950s—these missions greatly enhanced the knowledge of physiology and the high-altitude impacts on humans.

In many ways, the AFMS reached maturity with the invention of modular hospitals for the purpose of expeditionary uses, a concept perfected between 1965 and 1973. During this period, the air force used cargo planes, such as C-130s and C-141s, to reduce evacuation times to the continental United States, in order to expedite medical services to soldiers in need. In 1975, President Gerald R. Ford directed the U.S. Air Force to begin evacuation of orphans from Saigon and other areas of Vietnam. In a series of approximately 30 flights, nurses and other medical personnel cared for about 3,300 infants and children. Following the Cold War, however, contingency hospitals were for the most part removed from the AFMS.

The AFMS continued to expand operations, including the deployment of medics and expanded transportation, during the Persian Gulf War (1990–1991). During this period, research and development focused on transportable hospitals and the fatigue experienced by medical crews and medical flight crews in combat zones.

The Contemporary Period

During the period from 2005 to 2009, air force active-duty and guard teams took a leading role in disaster relief, ensuring the evacuation of approximately 2,600 patients during natural catastrophes. During Hurricane Gustav, the Air Mobility Command was responsible for evacuating more than 8,000 evacuees and more than 600 medical patients. The U.S. Air Force—active duty, guard, and reserves—continue to assist in rapid response and immediate health care.

In 2010, the U.S. Air Force surgeon general oversaw 60,000 total force medics. With the appointment of Lieutenant General (Dr.) Charles B. Green as surgeon general, the motto of the AFMS changed to "Trusted Care Anywhere." The AFMS focuses

on excellent health care delivery wherever it is needed. The AFMS also takes part in collaborative efforts to deploy health care services to multiple support teams assisting in humanitarian efforts where patients are the first and most immediate priority. In 2012, Lieutenant General (Dr.) Thomas W. Travis was appointed U.S. Air Force Surgeon General on the retirement of General Green.

The AFMS team works around the world to expedite medical care and to balance the demands on multiple missions in ever-expanding operation fields, as well as to decrease the response time to care for those in need. Coalition teams demonstrate response times of less than 40 minutes for transporting injured soldiers from the front lines to operating rooms.

SURGEON GENERAL, ARMY

The U.S. Army surgeon general is the senior officer in the U.S. Army Medical Department. As a staff officer to the army chief of staff and army secretary, the surgeon general is responsible for setting medical (including dental and veterinary) policies; as commander of the Army Medical Command (MEDCOM), he or she is responsible for delivering care at fixed-facility hospitals and clinics in the United States and overseas, for medical research, and for training of medical personnel. The surgeon general is also the executive agent for various Department of Defense-wide medical functions, such as the military vaccine program and the Armed Services Blood Program.

MEDCOM has a mix of regional medical commands (e.g., European or Pacific) that oversee the delivery of care and functional commands (e.g., Dental Command or Medical Research and Material Command). The personnel of the Army Medical Department are organized into eight corps: Medical, Army Nurse, Dental, Veterinary, Medical Service,

Medical Specialist, Enlisted, and Civilian. At senior levels, officers are often in “branch-immaterial” positions, so that a qualified dentist or physical therapist will command a hospital. The various medical corps had much the same recruiting experience as the rest of the army; when the war in Iraq lasted longer than expected and grew costly and controversial, recruiting dipped. The reserves were a particular problem, as many reservists had not expected repeated deployments, which put extreme pressure on their finances, especially for physicians. Policies later reduced the number of deployments (for all reservists) and especially the length of deployments for specific categories of medical personnel.

MEDCOM is responsible for the medical care of soldiers, family members, and retirees. Because demand exceeds the care that army treatment facilities can supply, MEDCOM is also involved with the TRICARE program. For instance, when a unit is readying for deployment and takes priority for medical care, other beneficiaries can be referred to civilian medical practitioners through the TRICARE network.

Operations after the terrorist attacks of September 11, 2001, have caused a number of changes. A lesson from Operation Desert Shield in Iraq was the need for pre- and postdeployment health assessments to catch problems before and after deployment. Because of the repeated deployments and the realization that the conflicts would involve more than a single mobilization and demobilization, postdeployment health reassessments were added to catch problems that had not yet manifested immediately on return from deployment. (Some Army Reserve medical units were also restructured to perform these duties.) Due to the increasing mobilization of reservists, who are often geographically remote from military bases, reservists were granted TRICARE access for a period of time before and after mobilization. Many improvised explosive devices have led to blast injuries; when those have involved the head, they have often resulted in traumatic brain injury (TBI). The wars in Afghanistan and Iraq that followed the 9/11 terrorist attacks resulted in a higher percentage of brain injuries among wounded soldiers than had been seen in previous conflicts and triggered debates over the proper diagnosis and treatment of TBI. This has led to new organizations (e.g., the Defense Centers of Excellence for Psychological Health and Traumatic Brain Injury) and substantial research funding. Blast injuries also have led to traumatic amputations and a reevaluation of the risks of giving

all combat medics a tourniquet. To speed properly trained first aid response, basic training was revised to upgrade the medical training of all soldiers to Combat Lifesaver levels. Extensive experience with trauma patients (including a registry, started in July 2003, of all traumatic injuries in combat theaters) has also led to changes in established practice for handling blood and other resuscitative fluids that will influence future care. Such developments in medical practice infused changes in policy, reflecting why the surgeon general is in charge of policy and also heads MEDCOM.

Other changes stemmed from another post-Desert Shield change to the medical system. Focused research and development, plus joint-level changes in intertheater aeromedical evacuation, now make it possible to safely fly patients from the theater to a major hospital in the United States in less than 3 days. That reduced the number of hospitals needed in theater and meant that military hospitals in the United States would be receiving gravely wounded patients. Due to improvements in battlefield medicine, patients who previously had little chance of surviving were now in hospitals in the United States. Advances in rehabilitation medicine, primarily from the civilian sector, made it possible for patients to recover from ever more devastating injuries and, in some cases, allowed amputees to return not only to duty but also to combat. Yet that type of rehabilitation takes longer periods of time. Because determining that someone has fully recovered can take years and the administrative process for medical discharges had not been addressed since the Vietnam War, the Medical Evaluation Board/Physical Evaluation Board process backed up. Also, unlike previous wars, many of the severely wounded wanted to remain in the army; they had volunteered and sought a career. Also, the Army Medical Department sought to take care of its own rather than transfer patients to other military or Veterans Administration hospitals. As early as October 2003, the combination of some of these factors had led to problems in demobilizing ill or injured reservists at Fort Stewart, Georgia.

When the Base Realignment and Closure Commission (BRAC) recommended closure of Walter Reed Army Medical Center, funding for maintenance was cut and personnel were not hired as a result of the pending closure. In February 2007, at a low ebb of public support for the war in Iraq,

the *Washington Post* published a Pulitzer Prize-winning series describing cases of patient neglect and unacceptable conditions at the Walter Reed Medical Center. Other media castigated the army for poor quarters, overstretched outpatient administration, and poor care of the wounded. The commander was relieved, as was the army surgeon general (who had commanded Walter Reed during 2 of the years during the period in question), and the secretary of the army resigned under pressure. In-patient care was never questioned. The Warrior Transition Command was established for better administration of outpatients around the army; money was made available for maintenance and additional staff; the Walter Reed civilian personnel office finished planning the downsizing and closure and could resume hiring staff; and substantial efforts with the adjutant general staff went into revising the Medical Evaluation Board/Physical Evaluation Board process and integrating the Veterans Administration physical examination and benefits process.

SURGEON GENERAL, NAVY

The surgeon general is the highest-ranking officer in the U.S. Navy Medical Corps, which serves the medical needs of the servicemen and servicewomen in

the Navy and Marine Corps and their families. Vice Admiral Matthew L. Nathan has held the position of Navy surgeon general since 2011 and is the 37th officer to hold that position. He also holds the title of 41st chief of the Bureau of Medicine and Surgery (BUMED), which was established by Congress on August 31, 1842, as a part of the Department of the Navy. Its first chief was the naval surgeon William P. C. Barton.

History

BUMED, the agency that oversees health care for Navy and Marine Corps personnel both on land and at sea, was initially housed at the Naval Observatory and moved to Bethesda, Maryland, in 1942. During World War II, the Navy Medical Department witnessed an enormous expansion in operations and personnel thanks to President Franklin Roosevelt's interest in expanding the navy. Under the direction of Roosevelt's personal physician, Surgeon General Vice Admiral Ross McIntire, BUMED grew from around 6,000 personnel in 1941 to almost 170,000 by 1945. McIntire was also responsible for the decision to compile the daily proceedings of the medical department and generate a never published history of the office. Since June 2012, BUMED has been located at Defense Health Headquarters in Falls Church, Virginia, as part of the Base Realignment and Closure mission.

Operations

BUMED controls naval hospitals, dental clinics, preventative medicine units, and technical schools for service members and personnel. Due to the wars in Iraq and Afghanistan, the demand for care has increased, both for combat injury and, increasingly, for behavioral care. The Continuous Process Improvement plan has been established to oversee the quality of health care and its business and financial outcomes and to transform health care services through professional education. BUMED also encompasses an Office of Women's Health to specifically support medical readiness for female sailors and marines.

The Office of the Medical Inspector General, BUMED's oversight branch, acts as the "eyes, ears, and conscience" of the Navy surgeon general. Its major programs, as part of the nonprofit Joint Commission on Health Care, are currently ambulatory health care, behavioral health care,

critical-access hospitals, home care, hospitals, laboratory services, long-term care, and office-based surgery. The Office of the Medical Inspector General's operating principles are integrity, responsibility, accountability, and transparency.

BUMED also works jointly in a resource-sharing program with the Department of Defense and the Veterans Administration on policy initiatives, which in recent years have included the expansion of Veterans Administration medical facilities. The Navy's Warrior Care Resources program expanded MEDEVAC services to wounded service members in 2010 and also provides stress control, suicide prevention, and management resources for personnel in distress. Other programs at BUMED include the Sexual Assault Prevention and Response Program, which provides a number of services to victims, including restricted and unrestricted reporting services.

The current strategic goals for BUMED (effective from 2011 through fiscal year 2015) address research and development, quality of care, patient- and family-centered care, agile capabilities, total force (maintaining medical capabilities through the full range of military operations), deployment readiness, and a performance-based budget. Within these categories, BUMED has outlined various strategic objectives focused on issues such as efficient management of resources, improving access to caregivers, prevention and management strategies for musculoskeletal disorders, improving performance within the Integrated Disability Evaluation System, and alignment of manpower and personnel.

SURRENDER

The American military tradition often equates the act of surrender with failure—a failure of command, perseverance, or courage. Indeed, the Uniform Code of Military Justice (Article 99 (2)) describes unnecessary surrender as military misconduct, but occasionally, U.S. commanders have faced circumstances where the welfare of their soldiers outweighed mission objectives and the possibility of facing court-martial. From the opposite perspective, however, U.S. forces have also experienced surrender as the victor. In those circumstances, U.S. commanders accept responsibility for the humane treatment of, and potential reconciliation with, defeated enemies.

Surrender of U.S. Arms

Along with many celebrated victories, the U.S. armed forces have a long history with surrender. During the American Revolution (1775–1783), the American general Benjamin Lincoln chose to defend Charleston, South Carolina, with 2,500 troops, many in ill health, against the British general Henry Clinton's force of 13,000 troops. He was concerned that if he abandoned the region, loyalists might lead South Carolina to strike a separate peace with the British. The Siege of Charleston began on April 1, 1780, and Lincoln could only hold out for a few weeks, capitulating on May 12. Although Clinton paroled Lincoln and several of his officers, most of the American troops remained prisoners of war (POWs) for some weeks.

Several highly criticized surrenders by U.S. forces took place during the War of 1812 (1812–1815), none more controversial than General William Hull's capitulation at Detroit. Charged with establishing a base for an offensive into Canada, his troops were nonetheless ill supplied and ill armed. The British general Isaac Brock, with effective artillery and two warships, sent a surrender demand on August 15, 1812, but Hull initially refused. On the 16th, after a day's bombardment, Brock launched an assault, but as his troops neared the entrenchments, Hull

displayed the white flag. He surrendered about 800 men, opened the northwestern frontier to British and Indian attacks, and quashed the U.S. dream of conquering Canada.

A worse surrender of U.S. arms during the Civil War occurred at Harper's Ferry, Virginia. As part of the 1862 Confederate offensive into Maryland, General Thomas "Stonewall" Jackson attacked that town to secure its arsenal. Colonel Dixon S. Miles of the Union, however, failed to defend the surrounding heights, so on September 15, after Jackson arrayed some 90 cannon and bombarded the city, Miles decided to surrender. He was killed by artillery shot just after he informed his officers. All told, the Union surrendered 12,400 soldiers.

The surrender at Harper's Ferry would remain the worst for U.S. arms until the Japanese invaded the Philippines in December 1941. Facing the Japanese force under General Masaharu Homma, General Douglas MacArthur ordered the withdrawal of U.S. forces from Manila to the Bataan Peninsula and established a new headquarters on Corregidor Island just off the coast to the south. Under orders, he left for Australia on March 11, 1942, and commanded his successor General Jonathan Wainwright not to surrender. But as Homma pushed south, and with only 25% of the force available to fight, ground commander General Edward King found his position untenable. On April 9, he surrendered 78,000 troops, both Filipino and American. It remains the largest surrender of U.S. forces. Homma continued to Corregidor and on May 6, compelled Wainwright to surrender another 11,000 soldiers.

Although these surrenders span two centuries, some commonalities emerge. In every case, the chief consideration of the commander was the welfare of his soldiers—weighing continued defiance and bloodshed against mission objectives and the expectation of reasonable treatment as POWs. Those who surrendered at Charleston, Detroit, and Harper's Ferry eventually received their paroles, or they were exchanged. The Filipino and American soldiers at Bataan, however, endured brutal conditions during the 60-mile march to a POW camp, which resulted in the deaths of anywhere between 5,000 and 11,000 soldiers. Although King and Wainwright might have reconsidered their choices if they had known the trials ahead, their decisions nevertheless spared the lives of many thousands.

Choosing surrender over continued defiance also meant facing possible reprimand and charges.

At Bataan, when King made his decision, he reportedly remarked that his career was over. Perhaps he recalled the court-martial that in 1814 found Hull guilty of cowardice and neglect of duty for his surrender of Detroit and that sentenced the general to death. Although spared his sentence, the veteran Hull was forced out of the army. After his surrender at Charleston, Lincoln insisted on an inquiry, confident that it would exonerate him, and he eventually returned to duty and served at the siege of Yorktown (1781). Generals King and Wainwright expected court-martials after the Japanese released them, but they returned home as heroes. Both received the Army Distinguished Service Medal, and Wainwright received the Medal of Honor, for their service in the Philippines.

Surrender to U.S. Arms

The U.S. armed forces also experienced surrender as the victor. War-ending surrenders that concluded the American Revolution, the Civil War, and World War II not only provided a symbolically decisive closure but also served as defining moments for the nation. The capitulation of Lord Cornwallis at Yorktown, Virginia, and General Robert E. Lee's 1865 surrender at Appomattox, Virginia, represented crucial moments that secured and preserved the existence of the United States. As a turning point in the Revolution, the surrender of the British general John Burgoyne at Saratoga (1777) was less important for its tactical victory than as a symbolic victory that contributed to the crucial French decision to join the American cause. During World War II (1941–1945), after his meeting with the British prime minister Winston Churchill at Casablanca (1943), the U.S. president Franklin D. Roosevelt declared a policy of only accepting the unconditional surrender of the Axis and rejecting any negotiated end to the war. Roosevelt's announcement was informed by the ambiguous victory after World War I (1917–1918) and his desire to rally public opinion. Although the Allies considered negotiated peace at several points, and some historians criticize the stance as contributing to the decision to use the atomic bomb, Allied forces nevertheless succeeded in obtaining the decisive capitulation of both Germany (May 8, 1945) and Japan (August 14, 1945).

In accepting surrender, U.S. commanders assume the responsibility for the humane treatment of a defeated enemy. In large-scale surrenders, they must

consider the immediate contingency of providing appropriate facilities for the care of POWs against the paroling of troops that could return to the fight, and when entire nations capitulate, the conduct of U.S. commanders has often established the groundwork for reconciliation. At the end of the Civil War, when General Ulysses S. Grant accepted the surrender of Lee, he permitted soldiers from the South to return to their homes. After World War II, both Japan and West Germany received millions of dollars in rebuilding aid through the Marshall Plan and would become staunch allies of the United States during the Cold War.

SYRIA

Syria is located on the coast of the eastern Mediterranean, bordering Iraq, Turkey, Lebanon, Jordan, and Israel. Syria became an independent country in 1946, after a period of French occupation, and proceeded through periods of political instability marked by numerous military coups, until Hafez al-Assad took the presidency in 1969. This entry examines modern Syria, including the Syrian political and economic systems, the antiregime uprisings starting in 2011, and Syrian regional and national security issues.

The Syrian Political System

Freedom House, a U.S.-based organization that researches political freedom and human rights around the world, ranks Syria as “not free,” because

of Baath party domination of the political system, which controls the nomination and selection of the president. The Syrian national assembly has no real power, nor does the judicial system, which the president heads. In the early 2000s, President Bashar al-Assad briefly tried to open Syria's closed political system and its state-run economy; however, senior Baath party members opposed these reform efforts, and they quickly ended. The resulting political and economic stagnation helped fuel anti-Assad movements, which began in south Syria and quickly spread to its major cities after similar demonstrations terminated the reign of long-standing autocratic leaders in Egypt and Tunisia. As of mid-2013, the revolution has left tens of thousands dead, thousands more injured, and widespread devastation. Yet the regime, dominated by the Assad family and led primarily by members of the minority Alawite regime (breakaway Shia sect that has links to Shia Islam), continued to fight on, and its security forces are using almost all of the weapons at their disposal to battle the rebel "Free Syrian Army" and other revolutionary forces.

The Syrian political system is relatively inclusive of Syria's religious groups. While the Assad family belongs to the Alawi religious sect, Sunni Muslims held significant positions in the national cabinet, and Syria's Christian population has enjoyed religious and political freedom. Whether such relative freedoms might exist in a post-Baath Syria is unclear, as the majority of Sunni revolutionaries have targeted both Alawi and Christian supporters of the Assad regime. Many Sunni and Christian senior officials have defected from the Baath leadership, possibly to avoid reprisals should the Assad regime fall.

The Syrian National Economy

Oil and agricultural revenues constitute almost half of Syria's national economy, though Syria is rapidly depleting its 2.5 billion barrel oil reserve. Much of Syria's economy is under state control and ownership, though the regime has allowed for some privatization and the opening of a stock exchange, but economic progress still remains poor. The Syrian revolt of 2011 and 2012 decimated an already weak economy, with sanctions, disruption of internal commerce, and a large population exodus to neighboring countries. In 2011, its 2% economic decline gave Syria a global economic growth rate ranking of 209, with only six countries doing worse.

Syrian Regional Relations

Syria participated in the 1948 Arab-Israel war, initiating Syria's long period of hostility toward the Jewish state. Syrian and Israeli forces also fought in 1967, a war that cost Syria the Golan region. Syria and Egypt fought Israel again in 1973 to regain lost territory, and while the war paved the way for Egypt to regain the Sinai, Syria failed to reclaim Golan, though a 1974 agreement established a demilitarized zone between Syria and Israel. The two countries engaged in brief but futile peace talks over the return of Golan in 1999 but have not met since to explore the possibility of a peace accord.

Until 1920, Lebanon was a part of greater Syria, and Syria continues to attempt to control events there by establishing ties with leading Lebanese political figures, partly to reduce the possibility of Israeli influence in that country. Syria also supported Hezbollah, the Lebanese Shia political and militia group, funneling materials from Iran through Syria (Hezbollah funneled the material with Syrian complicity). Syrian influence in Lebanon weakened considerably, however, in 2005 following the assassination of the former Lebanese prime minister Rafiq Hariri, which was widely blamed on Syria. Following massive anti-Syrian demonstrations in the spring of that year, Syrian military forces evacuated Lebanon, though Syrian influence remained through Hezbollah.

Syria shares a long border with Turkey, a North Atlantic Treaty Organization ally of the United States, and Turkish-Syrian relations have been tense in the past. The 2011–2012 antiregime uprising spoiled a slight warming of Turkish-Syrian relations, as Turkey sided with the insurgents. It did so largely for geopolitical reasons, because the embattled Assad regime had drawn closer to Iran, which Turkey considers a regional threat.

Syrian Relations With Terrorist Groups

Syria has had an ambiguous relationship with Middle East-based terrorist groups, supporting some, like Hezbollah, while resisting others, like al Qaeda and, in the early 1980s, the Palestinian Liberation Organization. Syria also continues to support the Palestinian Islamist group Hamas and reportedly allowed Syria-based Iraqi Baath party members to carry out attacks in neighboring Iraq. There are widespread reports of al Qaeda influence

in the anti-Assad movements, though most Syrian Sunni Muslims reject al Qaeda's extremism.

Syrian-American Relations

Syrian-American relations have never been close, though sometimes the two countries take advantage of mutual interests to cooperate. Following the September 11, 2001, terrorist attacks, Syria offered assistance to the United States against al Qaeda and reportedly detained and interrogated al Qaeda suspects. However, the already cool relations faded quickly after the initiation of the anti-Assad movement, and the administration of Barack Obama demanded the resignation of the Assad regime early in the uprisings.

The Syrian Armed Forces

Syria has around 292,000 personnel in uniform, with approximately 215,000 in the Syrian ground forces, many of them conscripts. The land forces operate around 5,000 main battle tanks, though most are obsolete and poorly serviced. Such conditions also exist in the Syrian air arm, equipped with older Russian aircraft, and in Syria's navy, fitted mostly with coastal patrol craft and several frigates. The Syrian military also operates surface-to-surface missiles of the Scud class, which are capable of carrying chemical warheads, and Syria is known to have developed such warheads. Syria experimented with a North Korean-supplied nuclear reactor until Israeli aircraft destroyed it in 2007. While the Syrian military suffered mass personnel defections, including by many senior generals, the core leadership

of the Alawi officers continued to fight on as of mid-2013.

Syria spent around 5.9% of its gross domestic product on national defense as of 2005, the most recent year for which data are available. This is significantly above the 2% global average, ranking it 12th in the world in defense spending.

Conclusions

Syria is located in a significant strategic region, in an area with many real and potential conflicts. It has strained relations with all of its neighbors, though a relatively weak military limits Syrian strategic options. The Assad regime has survived a protracted revolt against it, and as of mid-2013, its end appeared to be near. Since March 2012, more than 36,000 Syrians have died in the conflict that has threatened to fragment the country politically. Given Syria's often chaotic past, a post-Assad future is also likely to be unstable and problematic for both Syria and its neighbors.
